5. In apparatus for binding in the toe-piece of boots and other footwear, the combination of a nipper-box *e*; nipper-jaws *f* to the outer end of one of which at one side of the nipper-box is secured a binding-in cord *b*; a clamp *q* at the opposite side of the nipper-box for holding the cord *b* at another point, the said jaws having a groove *x* for the reception of the said cord; and a manually-operated cam *p* for operating the said clamp, whereby the cord *b* is held with a regulatable frictional resistance and laid with a suitable tension in the groove *x* when the nipper-box *e* is moved toward the last *r*.

6. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of a nipper-box *e*; nipper-jaws *f*; a clamp for holding a binding-in cord *b*, the said jaws having a groove *x* for the reception of said cord; a manually-operated cam for operating the said clamp, whereby the said cord *b* is held with a regulatable frictional resistance and laid with a suitable tension in the groove *x* when the nipper-box *e* is moved toward the last *r*; and pushers *u* for driving nails or equivalent fasteners through the binding-cord *b* and the upper-leather into the lip of the welt.

7. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of a nipper-box *e*; nipper-jaws *f*; a clamp for holding a binding-in cord *b*, the said jaws having a groove *x* for the reception of said cord; a manually-operated cam for operating the said clamp, whereby the said cord *b* is held with a regulatable frictional resistance and laid with a suitable tension in the groove *x* when the nipper-box *e* is moved toward the last *r*; pushers *u* for driving nails or equivalent fasteners through the binding-cord *b* and the upper-leather into the lip of the welt, the said nipper-jaws having arcuate grooves *v* in which the said pushers are guided; an operating-lever for said pushers; and links connecting said lever with said pushers respectively.

8. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of nipper-jaws *f*; mechanism for holding a binding-in cord *b* with a regulatable frictional resistances, pushers *u* for driving nails or equivalent fasteners through the binding-cord *b* and the upper-leather into the lip of the welt, the said nipper-jaws having arcuate grooves *v* in which said pushers are guided; an operating-lever for said pushers; and links *t* having a common pivot on said lever and connected respectively to said pushers.

9. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of nipper-jaws; mechanism for holding a binding-in cord with a regulatable frictional resistance, pushers for driving nails or equivalent fasteners through the said binding-in cord and the upper-leather into the lip of the welt; and means for adjusting the said nipper-jaws relatively to each other for right and left and crooked lasts.

10. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of a nipper-box *e*; nipper-jaws *f*; a clamp *q* for holding a binding-in cord *b*, the said jaws having a groove *x* for the reception of said cord; a manually-operated cam *p* for operating the said clamp; and pushers *u* for driving nails *a* through the binding-cord *b* and the upper-leather *c* into the lip *d*, each of the nipper-jaws *f* having a groove *v'* for guiding the said nails.

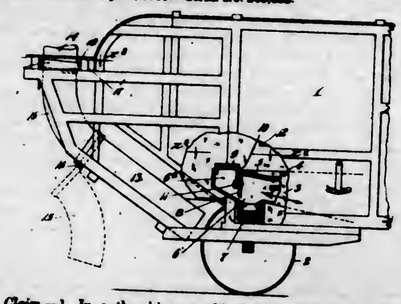
11. An apparatus for binding in the toe-piece of boots and other footwear, consisting of the combination of a nipper-box *e*; nipper-jaws *f*; a clamp *q* for holding a binding-in cord *b*, the said jaws having a groove *x* for the reception of said cord; a manually-operated cam *p* for operating the said clamp; pushers *u* for driving nails *a* through the binding-cord *b* and the upper-leather *c* into the lip *d*, the said nipper-jaws having arcuate grooves *v* in which the said pushers are guided and also having grooves *v'* for guiding the said nails; an operating-lever for said pushers; and links connecting said lever with said pushers respectively.

12. An apparatus for binding in the toe-piece of boots and other footwear, comprising a nipper-box *e*; nipper-jaws *f*, to one of which is secured a binding-in cord *b*; mechanism for holding the cord *b* at another point with a regulatable frictional resistance in such a way that on the movement of the nipper-box *e* toward the last *r*, for the purpose of lasting the toe-piece, the cord *b* lays itself with a suitable

tension on the working edge of the nipper-jaws *f*, the said jaws having a groove *r* for the reception of said cord; and pushers *v* for driving nails *a* through the binding-cord *b* and the upper-leather *c* into the welt *d*, the said nipper-jaws having arcuate grooves *v* in which the said pushers are guided and having also other arcuate grooves *v'* for receiving and guiding the said nails, substantially as described and set forth.

13. In an apparatus for binding in the toe-piece of footwear, the combination of nipper-jaws pivoted together; devices for operating the said nipper-jaws; means by which the nipper-jaws may be adjusted relatively to each other on their common pivot, for altering their relative closing positions; a clamp for holding a binding-in cord; manual devices for operating said clamp, whereby the said cord is held with a regulatable frictional resistance, each of the said nipper-jaws having a groove in its working edge for receiving the said cord; pushers guided upon said nipper-jaws for driving nails through the said binding-cord and the upper-leather into the welt; and driving mechanism for said pushers, the said nipper-jaws having grooves also for receiving and guiding the said nails.

810,774. THRESHING-MACHINE. ERIK KYLLOHEN, Enterprise, N. D. Filed May 31, 1905. Serial No. 263,022.



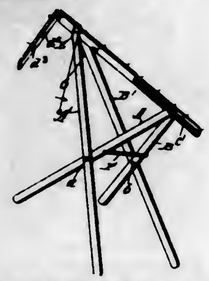
Claim.—1. In a threshing-machine, the combination with a sieve-equipped shoe, having a live-air passage, and provided with a discharge-hopper formed at its rear with a dead-air chamber, and a vertically-adjustable sieve overlying said dead-air chamber and independently adjustable with respect to said shoe-sieve, substantially as described.

2. In a threshing-machine, the combination with a sieve-shoe 3 provided with sieves 4 and 5, with a discharge-hopper 6, and with a partition 8, said partition affording a dead-air chamber 6' and terminating above the bottom of said discharge-hopper, of a vertically-adjustable sieve 9 overlying said dead-air chamber 6, and independently adjustable with respect to said sieves 4 and 5, substantially as described.

810,775. HOOK AND EYE. CHARLES LABOUTH, Chicago, Ill. Filed Mar. 10, 1905. Serial No. 249,249.

Claim.—A hook and eye comprising an eye having side portions separated at one end and connected at the other end by a cross-piece provided at its center with a slight kink or bend extending outwardly at a right angle to the plane of the eye, a hook having parallel portions forming a neck and extending around and back by the sides of the neck, thereby providing springy hook portions which are slightly out of line with the neck at their ends, said neck being adapted to engage the under or concave side of said kink or bend when the eye and hook are interlocked, and the said hook portions at such time being adapted to rest upon the said cross-piece at each side of the said kink or bend, whereby the hook has three distinct points of engagement with the eye, namely one at the center of the under side of the cross-piece and one at each side thereof on the upper side of the same, and whereby the said springy hook portions bear down upon the cross-piece and hold the same firmly upon the said neck, substantially as set forth.

810,776. TRIVET. HARRY M. LAY, Chicago, Ill. Filed May 1, 1905. Serial No. 258,219.



Claim.—1. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a top bar adapted to slidably engage said pivot and to removably engage the top of the other pair of legs at various points in the length of the beam.

2. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a top bar adapted to slidably engage said pivot and to removably engage the top of the other pair of legs at various points in the length of the beam, and means for causing said pair of legs to tightly grip said top bar.

3. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a top bar adapted to slidably engage said pivot and to removably engage the top of the other pair of legs, and means for causing said pair of legs to tightly grip said top bar, said means comprising a series of notches in said top bar and a spreader pivotally attached to one of said legs and adapted to engage the corresponding leg of the other pair.

4. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a top bar provided with a slot at one end and within which said pivot is adapted to move, said top bar being also provided with a series of inwardly-extending notches adapted to receive the tops of the other pair of legs, and a spreader for maintaining said legs apart and to cause the tops of same to firmly grip said top bar.

5. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a top bar provided with a slot at one end and within which said pivot is adapted to move, said slot being provided with series of notches for engaging said pivot, said top bar being also provided with a series of inwardly-extending notches adapted to receive the tops of the other pair of legs, and a spreader for maintaining said legs apart and to cause the tops of same to firmly grip said top bar.

6. In a trestle, the combination with two pairs of legs, a pivot connecting the tops of one of said pairs, a sectionally-hinged top bar adapted to slidably engage said pivot and to removably engage the top of the other pair of legs at various points in the length of the beam.

7. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a sectionally-hinged top bar provided with a slot at one end and within which said pivot is adapted to move, said top bar being also provided with a series of inwardly-extending notches adapted to receive the tops of the other pair of legs, and a spreader for maintaining said legs apart and to cause the tops of same to firmly grip said top bar.

8. In a trestle, the combination with two pairs of legs, a pivot connecting the tops of one of said pairs, a sectional top bar, the sections being hinged horizontally and the bar being adapted to slidably engage said pivot and to removably engage the tops of the other pair of legs at various points in the length of the beam.

9. In a trestle, the combination with two pairs of legs, a pivot connecting the top of one of said pairs, a sectional bar, the sections being hinged horizontally and provided with a slot at one end, within which said pivot is adapted to move, said top bar being also provided with a series of inwardly-extending notches adapted to receive the tops of the other pair of legs, and a spreader for maintaining said legs apart and to cause the tops of same to firmly grip said top bar.

10. In a trestle, the combination with two pairs of legs, connected together, of a pivot connecting the tops of one of said pairs, a sectional bar adapted to engage said pivot at a plurality of points and removably engage the top of the other pair of legs, at a plurality of points, a hinge connecting the sections of said bar and a movable reinforcing-piece covering said hinge.

11. In a trestle, the combination with supports, of a top bar provided with a slot at one end, a series of notches within said slotted portion, the top of said bar above said slotted portion being chamfered, and a series of inwardly-extending notches on the lower portion of the other end of said bar said supports being adapted to engage said notches and chamfered portion.

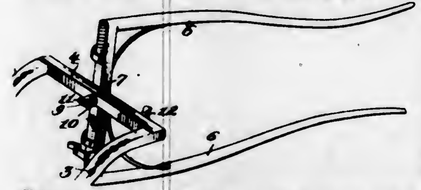
12. In a trestle, the combination with supports, of a top bar comprising two parts hinged together horizontally and provided with a slot at one end, a series of notches within said slotted portion, the top of said bar above said slotted portion being chamfered, and a series of inwardly-extending notches on the lower portion of the other end of said bar said supports being adapted to engage said notches and chamfered portion.

13. In a trestle, the combination with supports, of a top bar comprising two parts hinged together horizontally, said hinged portion being normally covered by a movable reinforcing-piece, and provided with a slot at one end, a series of notches within said slotted portion, the top of said bar above said slotted portion being chamfered, and a series of inwardly-extending notches on the lower portion of the other end of said bar said supports being adapted to engage said notches and chamfered portions.

14. A folding trestle, comprising a slotted top piece, legs provided with two supporting-points, said slotted top piece being provided with a plurality of shoulders adapted to engage said supporting-points so that each of said supporting-points may be adjusted to different positions along the length of said top piece.

15. A folding trestle, comprising a top piece, a support arranged to engage said top piece at two points, said points of support being adjustable along the length of said top piece, and said support being provided with one permanent connection with said top piece.

810,777. SHAFT-COUPLING. ARTHUR J. L. LEHRBACK and NAT B. HART, Walla Walla, Wash. Filed Mar. 22, 1905. Serial No. 251,533.



Claim.—1. In combination with a pair of thill members connected by a cross-bar, a pair of shafts connectd by a cross-bar, said cross-bars being pivotally united to permit free rotation of the shafts, and means for locking the shafts in their normal position.

2. In combination with a pair of thill members connected by a cross-bar, a pair of shafts connected by a cross-bar, said cross-bars being pivotally united to permit free rotation of the shafts, a clip for limiting the movement of the shafts in one direction, and a spring-clip mounted on one of said cross-bars and adapted to engage the other for locking the shafts in their normal position.

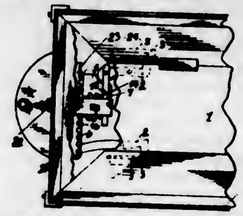
3. In combination with a pair of shafts pivotally connected to a wagon member to rotate freely thereon, means for limiting the movement of said shafts in one direction, and means for locking the shafts in their normal position.

4. In combination with a pair of thill members connected by a cross-bar, a pair of shafts connected by a cross-bar, a king-bolt passed through said cross-bars and forming a pivot upon which said shafts may freely rotate, a bracket-arm secured between said cross-bars by said king-bolt, and a swingle tree mounted on the cross-bar of said shafts and being pivotally secured thereon by a bolt passing through said bracket-arm.

810,778. SPRAGGING DEVICE FOR COAL AND PIT CARS. JOHN LEVAR, Lemont Furnace, Pa. Filed Oct. 5, 1905. Serial No. 281,513.

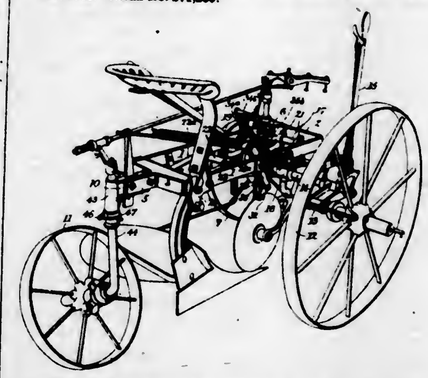
Claim.—1. The combination with a car, of arms pivotally mounted in said car adjacent to the wheels thereof, actuating-levers pivotally connected to said arms, a toothed wheel engaging said levers, a toothed angle-bar mounted in said car and adapted to actuate said toothed wheel, a lever, pivotally connected to the end of said car and adapted when oscillated to reciprocate said angle-bar, substantially as described.

2. In a spragging device, the combination with a car, of arms pivoted adjacent to the wheels of said car, actuating-levers pivotally connected to said arms, a toothed wheel engaging said levers, a lever pivotally connected to the end of said car, means actuated by oscillating said lever to rotate said toothed wheel and thereby move said actuating-levers, substantially as described.



3. In a spragging device, the combination with a car, of two separate arms each pivotally mounted adjacent to the wheels of said car, each arm being provided with a tooth extending through an opening in the side of the car and adapted to be moved into engagement with said wheels, a lever pivotally connected to the end of said car and extending upwardly at right angles to the bottom of the car, means whereby said arms will be moved in unison by oscillating said lever, substantially as described.

810,779. WHEELED PLOW. ALEXUS C. LINDGREN, Moline, Ill., assignor to Moline Plow Company, a Corporation of Illinois. Filed July 25, 1905. Serial No. 271,909.



Claim.—1. In a plow, the combination of the frame, a plow-beam supported thereby and movable vertically with relation thereto, a beam-depressing foot-lever mounted on the frame, operative connections between the foot-lever and the beam for depressing the beam, and a locking device carried by the beam and adapted when the beam is elevated to engage the frame and hold the beam raised, said locking device adapted to be unlatched by means independent of the foot-lever, and being extended in proximity to said foot-lever; whereby the driver may with one foot both release and lower the beam.

2. In a plow, the combination with the frame, of a plow-beam supported thereby and movable vertically with relation thereto, a beam-depressing lever mounted on the frame and operatively connected with the beam for depressing the same, said lever being extended within reach of the driver, and a locking-latch mounted on the beam and adapted, when the beam is elevated, to interlock with the frame and hold the beam raised, said locking-latch being extended within reach of the driver and in proximity to the depressing-lever, and adapted to be unlatched by means independent of the depressing-lever; whereby the driver is enabled to conveniently release the beam and effect its depression.

3. In a plow, the combination with the frame, of a plow-beam supported thereby and movable vertically with relation thereto, a beam-depressing foot-lever mounted on the frame, operative connections between the lever and the beam for depressing the latter, a foot-rest on the lever, a locking-latch connected with the beam and formed to interlock with the frame when the beam is elevated and

hold the same raised, said locking-latch being independent in its action of the beam-depressing lever and a foot-rest on said latch extending in proximity to the foot-rest of the depressing-lever.

4. In a plow, the combination with the frame, of a plow-beam supported thereby and movable vertically, a foot-lever mounted on the frame, operative connections between the foot-lever and the beam for depressing the latter, a foot-rest on the lever, a locking-latch connected with the beam and formed, when the beam is elevated, to interlock with the frame and hold the beam raised, and a foot-rest on the locking-latch disposed adjacent to the other foot-rest and a short distance below the same; whereby the driver may with one foot resting on the foot-rest of the depressing-lever first release the latch with the heel and then depress the beam.

5. In a plow, the combination with the frame, of a vertically-movable plow-beam supported thereby, a foot-lever mounted on the frame and extending upwardly when the beam is raised, operative connections between the lever and the beam, adapted, when the lever is forced forward, to depress the beam, and a latch-rod jointed to the beam and arranged, when the beam is elevated, to extend upward alongside the foot-lever and to interlock with the frame, and adapted to be unlatched by means independent of the foot-lever.

6. In a plow, the combination with the frame, of the vertically-movable plow-beam supported thereby, a transverse rock-shaft mounted on the frame, a crank-arm on one end of the shaft a link, connecting the crank-arm with the beam, a foot-lever connected with the crank-arm and formed with a foot-rest, a second foot-lever on the opposite end of the rock-shaft, a latch-rod pivoted to the beam and formed when the beam is elevated to interlock with the frame and hold the beam raised, and a foot-rest on the latch-rod in position to extend in proximity to the foot-rest of the depressing-lever when the beam is locked in elevated position.

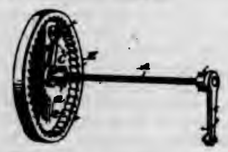
7. In a wheeled plow, the combination with the frame, of a vertically-movable plow-beam sustained thereby, means for elevating the beam, a locking device for holding the beam in elevated position, and mechanism for depressing the beam when released, the said locking device and the said depressing mechanism being wholly independent of each other, and both adapted to be actuated by one foot.

8. In a plow, the combination with the frame, of a vertical shell or bearing connected thereto, a horizontal oscillating disk mounted in the same and formed with an opening eccentrically disposed, a vertical furrow-wheel stem extending through the opening in the disk and into the shell, means for oscillating the disk to effect the adjustment of the stem, and means for fastening the disk fixedly to said shell in its different adjusted position.

9. In a plow, the combination with the frame, of a vertical hollow conical shell fixed thereto, a horizontal adjustable disk mounted for oscillation in the larger end of the shell, and formed with an opening eccentrically disposed, a furrow-wheel stem extending through the opening in the disk and through the end of the shell, means for oscillating the disk to effect the adjustment of the stem, and means for holding the disk in its adjusted position.

10. In a plow, the combination with the frame, of a support for the rear furrow-wheel stem, said support comprising a vertical hollow conical shell fixed to the frame with its smaller end uppermost, a horizontal adjusting-disk provided with an eccentrically-disposed opening mounted loosely in the base of the shell, a vertical furrow-wheel stem extending through the opening in the disk and into the shell, a handle on the disk, and a binding-screw carried by the shell and adapted to engage the disk.

810,780. POWER-TRANSMITTER. WLADIMIR LORENZ and VICTOR LORENZ, Budapest, Austria-Hungary. Filed Dec. 24, 1901. Renewed May 27, 1905. Serial No. 262,663.



Claim.—1. The combination, with a driving mechanism having a rotating part capable of storing kinetic energy, of automatic mechanism for intermittently applying a load to said driving mechanism during a part of each rotation which part is an inverse function of the said load.

2. In a device of the class described, an oscillating part designed to be operated from a prime mover, a driven wheel, a moving part operated by said oscillating part, means for connecting said moving part with the driven wheel on movement in one direction and for disconnecting it on movement in the opposite direction, and a plurality of spring-rods connecting the oscillating member with said moving part, substantially as described.

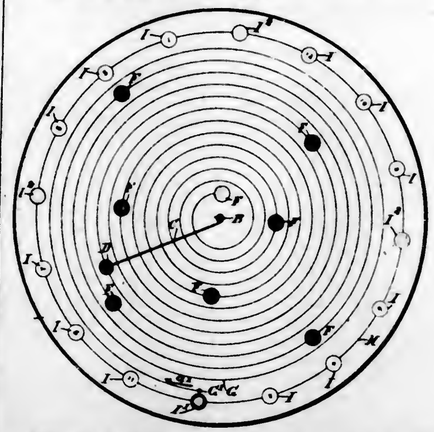
3. In a device of the class described, an oscillating arm designed to be operated from a prime mover, a driven wheel, a moving part located in proximity to said driven wheel, means for causing said moving part to be put into engagement with said wheel on movement in one direction, and to be disengaged therefrom on movement in the opposite direction, and a torsion-spring connecting said oscillating arm and moving part, substantially as described.

4. The combination, with a vibratory driving element having a fixed stroke, of a vibratory driven element, a yielding connection between said driving and driven element, and means for converting the vibratory motion of the driven element into a unidirectional movement.

5. The combination, with a vibratory driving element, and a driven element, of a yielding connection between the driving and driven elements capable of storing substantially the entire energy of the driving element for one stroke of the latter.

6. The combination, with a vibratory driving element having a fixed stroke, of a driven element, and a yielding connection between said driving and driven elements capable of storing substantially the entire energy of the driving element for one stroke of the latter.

810,781. GAME APPARATUS. RALPH D. MARTIN, Tampa, Fla. Filed Mar. 8, 1905. Serial No. 249,989.



Claim.—1. A game apparatus comprising a board having stations arranged in a spiral line on the surface of the board, a pivot on the said board, central to the said spiral line, a cord secured at one end on the said pivot and adapted to wind and unwind on and from said pivot, and a disk on the outer end of the said cord, adapted to be propelled by the player over the board's surface.

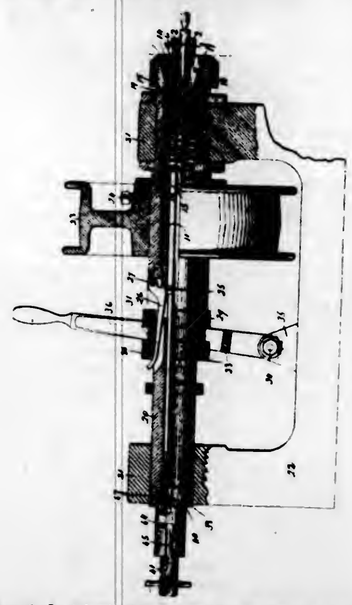
2. A game apparatus comprising a board having stations arranged in a spiral line on the surface of the board, a pivot on the said board, central to the said spiral line, a cord secured at one end on the said pivot and adapted to wind on the said pivot in a downward direction and to unwind from the pivot in an upward direction, and a disk on the outer end of the said cord, adapted to be propelled by the player over the board's surface.

3. A game apparatus comprising a board having stations arranged in a spiral line on the surface of the board, a pivot on the said board, central to the said spiral line, a cord secured at one end on the said pivot and adapted to wind and unwind on and from the said pivot, and a disk on the outer end of the said cord, adapted to be propelled by the player over the board's surface, the said disk following the said spiral line.

4. A game apparatus comprising a board provided on its surface with stations arranged in a spiral, a pivot secured on the board and rising from the surface centrally to the said spiral, the circumference of the pivot corresponding to the distance between adjacent convolutions of the said spiral, a cord secured at one end to the upper portion of the said pivot, and a disk on the outer end of the said cord, adapted to be propelled over the board's surface, to cause the cord to wind up or unwind on or from the said pivot.

5. A game apparatus comprising a board provided on its surface with stations arranged in a spiral, a pivot secured on the board and rising from the surface centrally to the said spiral, the circumference of the pivot corresponding to the distance between adjacent convolutions of the said spiral, a cord secured at one end to the upper portion of the said pivot, and a disk on the outer end of the said cord, adapted to be propelled over the board's surface, to cause the cord to wind up on or unwind from the said pivot, the said disk following the spiral to reach the stations, the latter being spaced unequal distances apart.

810,782. CHUCK. WILLIAM MASON, New Haven, Conn., assignor to Winchester Repeating Arms Co., New Haven, Conn., a Corporation. Filed Apr. 1, 1905. Serial No. 253,321.



Claim.—1. In a chuck, the combination with two movable centers, of a spindle, main jaws carried thereby, and supplemental jaws mounted in the main jaws and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered by the said centers with respect to the axis of the spindle and prior to the operation of the main jaws for clamping the work.

2. In a chuck, the combination with two movable centers, of a spindle, main jaws carried thereby, and longitudinally-movable wedge-shaped supplemental jaws mounted in the said main jaws and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered by the said centers with respect to the axis of the spindle and prior to the operation of the main jaws for clamping the work.

3. In a chuck, the combination with two movable centers, of a tubular spindle having one of the said centers located outside of but near its outer end, and the other of the said centers located within and near its inner end, main jaws carried by the said spindle at its outer end, and supplemental jaws mounted in the main jaws and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered by the said centers with respect to the axis of the spindle and prior to the operation of the main jaws for clamping the work.

4. In a chuck, the combination with a spindle, of two movable centers respectively located substantially at the ends thereof, main jaws, and supplemental jaws mounted therein and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered with respect to the axis of the spindle by the said centers and prior to the operation of the main jaws for clamping the work.

5. In a chuck, the combination with a spindle, of a sleeve located therein, main jaws carried by the sleeve, a sliding sleeve located in the spindle for forcing the main jaws toward each other, a removable center for insertion into the inner end of the spindle, a movable center located adjacent to the jaws and movable into and out of a line coincident with a line passing through the center of the spindle, and supplemental jaws mounted in the main jaws and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered with respect to the axis of the spindle by the centers and prior to the operation of the main jaws for clamping the work.

6. In a chuck, the combination with a spindle, of a sleeve split to form spring main jaws, a sliding sleeve for forcing the main jaws toward each other, the spindle containing the sleeves, a removable plug carrying a yielding center for insertion into the inner end of the spindle, a movable center located adjacent to the jaws, and supplemental jaws mounted in the main jaws and constructed and arranged to be independently moved by direct manual engagement into frictional contact with the work after the same has been centered with respect to the axis of the spindle and prior to the operation of the main jaws for clamping the work.

7. In a chuck, the combination with a spindle, of a sleeve split to form spring main jaws a sliding sleeve for operating the said jaws, the spindle containing the sleeves, a removable plug carrying a center for insertion into the inner end of the spindle, means carried by the plug for gripping the work, a movable center located near the main jaws, and supplemental jaws mounted in the main jaws and constructed and arranged to be independently moved into frictional contact with the work after the same has been centered with respect to the axis of the spindle and prior to the operation of the main jaws for clamping the work.

810,783. FRICTION-CLUTCH. JONATHAN D. MAXWELL, Detroit, Mich. Filed July 26, 1904. Serial No. 217,925.

Claim.—1. In a clutch, the combination with a driving and a driven shaft arranged in axial alinement with their ends abutting, a facing-disk having an axial sleeve secured to the end of one shaft and forming a socket to receive the end of the opposite shaft, a series of discous plates mounted on said sleeve at one side of said disk, a longitudinally-movable facing-disk at the other side of said plates, a feather secured to the sleeve and engaging notches in the plates and movable disk, a yoke secured to the shaft opposite that to which the sleeve is secured and having outwardly-extending arms provided with lateral ends extending longitudinally over said plates and disks, a second series of discous plates mounted on the sleeve between the first plates and disks and free to turn thereon and provided with notches in their peripheries to engage the ends of the yoke, flat springs secured to one face of each of the plates of the second series outside the peripheries of the first series and each engaging the adjacent plate of the series at its ends to force said plates apart, and means for moving the plates of one series into frictional contact with those of the other against the action of said springs.

2. In a clutch, the combination with a driving and a driven shaft, arranged in axial alinement with their ends abutting, a sleeve keyed to one end of the driven shaft and forming a socket to receive the end of the driving-shaft, a facing-disk integral with said sleeve, a series of discous plates on the sleeve at one side of the disk, a movable facing-disk on the sleeve at the other side of said plates, feathers secured to the sleeve and engaging notches in the plates and movable disk, a second series of discous plates of a greater diameter than the first series interposed between the same and having notches in their peripheries, a yoke secured to the driving-shaft and having outwardly-extending arms provided with ends extending longitudi-

nally of the shaft to engage the notches in said plates, a strip secured to the end of each arm to hold the plates from being disengaged therefrom, flat springs secured to each of the plates of the second series near their peripheries outside of the peripheries of the plates of the first series and each bearing against the adjacent plate in the second series, an internally-screw-threaded collar screwed upon the end of the sleeve and provided with outwardly-extending ears, levers pivoted intermediate their ends between said ears with their ends in engagement with the movable facing-disk, and a clutch member movable longitudinally on the driven shaft to engage the opposite ends of said levers and force the same outward.

810,784. STOPPER FOR ICE-BAGS, HELMETS, AND THE LIKE. CHRISTIAN W. MEISSNER, Jersey City Heights, N. J., assignor to Whitall Tatum Company, New York, N. Y., a Corporation of New Jersey. Filed Sept. 30, 1905. Serial No. 280,826.

Claim.—1. A closure for the mouth of ice-bags or the like having an elastic cap adapted to give a hold to the operater and combined with a packing or washer.

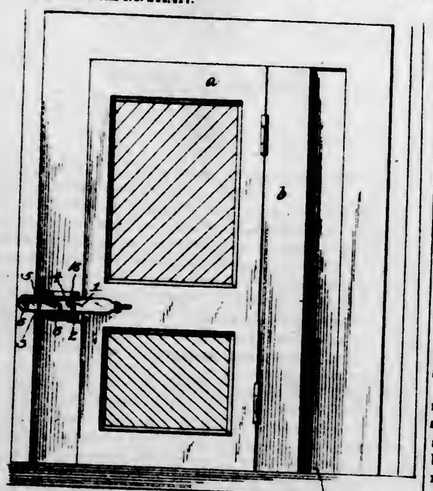
2. A closure for ice-bags or the like comprising a threaded body portion with a flange or overhanging top part, and an elastic cap placed on the top and lapped about the flange and combined with a packing or washer at the under side thereof.

3. A closure for ice-bags and the like having a flanged top portion, a packing-ring seated against the under side of the flange, and an elastic cap stretched over the top and flange to engage and hold the packing-ring in place.

4. A closure for ice-bags and the like having a packing at the under or contact face thereof and an elastic packing-holder under the packing and lapped about the edge onto the upper part of the closure.

5. A closure for ice-bags and the like provided with a packing or washer and an elastic holder or cap for the packing.

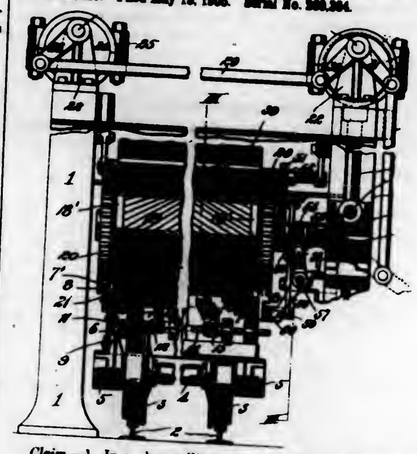
810,785. LOCK. ALBERT H. MEYERS, Johnstown, Pa. Filed Feb. 6, 1905. Serial No. 244,417.



Claim.—1. A lock comprising a casing having a socket secured to the back portion thereof, spring-pressed tumblers in said casing, each having a beveled notch, a bail having long and short arms, the long arm being mounted in said socket, a spring in said socket engaging said long arm, said short arm provided with notches, and a beveled end to be engaged by said tumblers, and a hasp provided with a slot and a perforation to be engaged by said bail.

2. A lock comprising a casing having a socket secured to the back portion thereof, spring-pressed tumblers in said casing, said tumblers each provided with a beveled notch, a spring in the bottom of the socket, a bail having a long arm pivotally mounted in said socket and provided with a head to bear against said spring, a short arm on said bail, said short arm provided with notches to be engaged by said tumblers, and a hasp provided with slots and perforations to be engaged by said bail, substantially as described.

810,786. GLASS-ROLLING APPARATUS. ANTON MEYER, St. Louis, Mo. Filed May 15, 1905. Serial No. 260,304.



Claim.—1. In a glass-rolling apparatus, the combination of a carriage provided with a table, a series of rolls arranged to be geared to said carriage, vertically-movable journal-boxes in which said rolls are journaled, lift-rods connected to said journal-boxes, eccentrics fitted to said lift-rods, and means for operating said eccentrics to move said lift-rods; said operating means consisting of a crank-arm fixed to one of said eccentrics, a bell-crank fixed to the other eccentric, a connecting-rod uniting said crank-arm and bell-crank, a throw-rod connected to said bell-crank, and a lever for actuating said throw-rod, substantially as set forth.

2. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, means for delivering wire fabric to said carriage past said roll, a slotted bar located adjacent to said roll, a knife associated with said slotted bar, and means for actuating said knife to sever the wire fabric passing through said slotted bar, substantially as set forth.

3. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, means for delivering wire fabric to said carriage past said roll, a slotted bar located adjacent to said roll, a knife associated with said slotted bar, and means actuated through the medium of said carriage for operating said knife to sever the wire fabric passing through said slotted bar, substantially as set forth.

4. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, means for delivering wire fabric to said carriage past said roll, a slotted bar located adjacent to said roll, a knife associated with said slotted bar, a lever connected to said knife, and a trip-block carried by said carriage and adapted to engage said lever, substantially as set forth.

5. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, means for delivering wire fabric to said carriage past said roll, a slotted bar located adjacent to said roll, a knife associated with said slotted bar, a lever connected to said knife, and a trip-block adjustably secured to said carriage and arranged to engage said lever, substantially as set forth.

6. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, guiding and feed rollers located in proximity to said roll for feeding wire fabric onto said carriage, a clutch member loosely associated with said roll, and geared to one of said rollers, a clutch on the shaft of said roll opposing said clutch member, and means actuated through the medium of said carriage for freeing said clutch from said clutch member, substantially as set forth.

7. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, guiding and feed rollers located in proximity to said roll for feeding wire fabric onto said carriage, a clutch member loosely associated with said roll and geared to one of said rollers, a clutch on the shaft of said roll opposing said clutch member, a lever fitted to said clutch, and means carried by said carriage for actuating said lever to shift said clutch, substantially as set forth.

8. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, guiding and feed rollers located in proximity to said roll for feeding wire onto said carriage, a clutch member loosely associated with said roll, and geared to one of said rollers, a clutch on the shaft of said roll opposing said clutch member, a shift-lever fitted to said clutch and a trip-block carried by said carriage and arranged to trip said lever, substantially as set forth.

9. In a glass-rolling apparatus, the combination of a carriage, a roll surmounting said carriage, guiding and feed rollers located in proximity to said roll for feeding wire fabric onto said carriage, a clutch member loosely associated with said roll and geared to one of said rollers, a clutch on the shaft of said roll opposing said clutch member, a lever fitted to said clutch and a trip-block adjustably secured to said carriage and arranged to trip said lever, substantially as set forth.

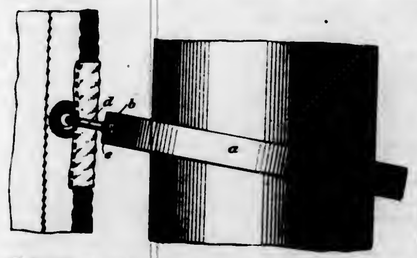
10. In a glass-rolling apparatus, the combination of a carriage provided with a table, and a roll surmounting said carriage; said roll being convoluted and having a polygonal perimeter, substantially as set forth.

11. In a glass-rolling apparatus, the combination of a carriage provided with a table, and a roll surmounting said carriage; said roll being provided with convolutions disposed obliquely relative to the axis of the roll, substantially as set forth.

12. In a glass-rolling apparatus, the combination of a carriage provided with a table, a roll surmounting said carriage; said roll having its periphery provided with convolutions extending in compound curves, substantially as set forth.

13. In a glass-rolling apparatus, the combination of a carriage provided with a table; a roll surmounting said carriage; said roll having its periphery provided with convolutions extending in compound curves and said convolutions being flattened to provide the roll with a polygonal periphery, substantially as set forth.

810,787. DEVICE FOR BENDING FORE-AND-AFT SAILS. JAMES H. MITCHELL, Westerly, R. I. Filed May 17, 1905. Serial No. 260,860.



Claim.—1. The combination with a mast-hoop, of a shackle-plate secured thereto, said plate having openings therein, an essentially U-shaped shackle having at one end a T-shaped head and at the other end an L-shaped head, said heads being adapted to fit in the openings in the shackle-plate, and a removable dog for holding the L-shaped end of the shackle engaged with the inner side of the shackle-plate.

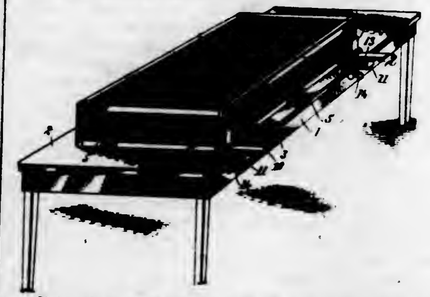
2. The combination with a mast-hoop, of a shackle-plate secured thereto, said plate having openings therein, an essentially U-shaped shackle having at one end a T-shaped head and at the other end an L-shaped head, said heads being adapted to fit in the openings in the shackle-plate, and a removable dog for holding the L-shaped end of the shackle engaged with the inner side of the shackle-plate, said dog having a portion at its free end adapted to enter the opening in the shackle-plate receiving the L-shaped end of the shackle.

3. The combination with a mast-hoop having two cavities therein, of a shackle-plate secured to the mast-hoop and having openings registering respectively with the cavities in the hoop, an essentially U-shaped shackle having at one end an enlargement adapted to be received in one opening in the hoop, and having at the other end a laterally-turned portion adapted to be received in the second opening in the hoop, and means for removably holding said second end in active position.

4. The combination with a mast-hoop having two cavities therein, of a shackle-plate secured to the mast-hoop and having openings registering respectively with the cavities in the hoop, an essentially U-shaped shackle having at one end an enlargement adapted to be received in one opening in the hoop, and having at the other end a laterally-turned portion adapted to be received in the second opening in the hoop, and means for removably holding said second end in active position, said means comprising a dog mounted on the shackle-plate and having a portion adapted to enter the opening in the shackle-plate which receives the second-named end of the shackle.

5. The combination with a mast-hoop having two cavities therein, of a shackle-plate fastened to the hoop and having orifices respectively matching the cavities, the shackle-plate having portions overhanging the cavities in the hoop, an essentially U-shaped shackle having enlarged ends capable of passing the orifices in the shackle-plate and adapted to bear against the inner side of the said overhanging portion of said plate, and a dog adapted removably to hold the shackle in place.

810,788. SCREEN. JOHN B. MOSELEY, Danville, Va. Filed June 16, 1905. Serial No. 265,881.



Claim.—1. A screen adapted to be set upon a table and having hinges with leaves adapted to lie upon the surface of said table, and clamps formed on said leaves and adapted to attach to the edge of the table.

2. A screen adapted to rest upon the top of a table and having hinges attached thereto, said hinges having leaves adapted to lie upon the table-top, brackets attached to said leaves forming throats adapted to receive the edge of the table-top, and clamp-screws carried by said brackets and adapted to clamp the edge of the table-top.

810,789. FISHING DEVICE. WALTER L. MOSS, Blains, Ga. Filed Aug. 19, 1905. Serial No. 274,865.

Claim.—1. A fish-hook carrying a rudder-vane extending edgewise in the same general direction as the barbed bight portion of the hook to hold the same pointed in a desired direction in a stream.

2. A fishing device comprising a support carrying a hook and having a vane projecting therefrom in the same general direction as the barbed bight portion of the hook and forming a rudder.

3. A fishing device comprising a support having a weighted lower end, a snag-hook carried thereby, a bait-hook disposed above said snag-hook, and a vane disposed above the bait-hook and acting as a rudder.

4. A fishing device comprising a shank carrying a weight, a bait-hook above the weight, and a snag-hook projecting below the weight, and an impelling-plate supported by the shank in rear of said snag-hook.

5. A fishing device comprising a shank provided at its upper end with a rudder-vane, and carrying at its lower end a weight, a bait-hook upon the shank above the weight, a snag-hook projecting below the weight, and an impelling-plate supported below the weight and in rear of the snag-hook.

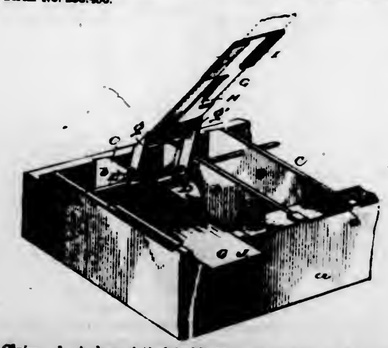
810,790. **BALLOTING-BOX.** WILLIAM W. MCCOLLUM, Briarfield, Ala. Filed Oct. 24, 1905. Serial No. 284,191.

Claim.—1. In a device of the class described, a box provided with a discharge-opening, a movable cover for the box having an inlet-opening, a hood arranged on the cover over said opening, a valve pivoted in the box and adapted to normally lie in a rearwardly-inclined position and to close the discharge-opening, and means for moving the valve to open the discharge-opening and permit automatic discharge of the contents of the box.

2. In a device of the class described, a box having a discharge-opening, a movable cover for the box provided with an inlet-opening, a hood arranged over the inlet-opening, a valve pivoted in the box to swing in a vertical plane and provided with a finger-piece projecting to the outside of the box, and a spring disposed beneath the forward portion of the valve and adapted to maintain the same normally in a rearwardly-inclined position with its front edge disposed above the discharge-opening.

3. In a device of the class described, a balloting-box having a cover and provided with an inlet and a discharge opening, a hood arranged over the inlet-opening, a valve pivoted in the box and adapted to receive balloting members introduced into the latter, said valve having a finger-piece projecting outside of the box, a spring acting on the valve to maintain the same normally in rearwardly-inclined position with its edge at one side of its pivotal axis disposed in a plane above the discharge-opening, and a receptacle designed to receive the balloting members when discharged from the box.

810,791. **DRUGGIST'S LABEL-HOLDER.** NEWTON W. MCCOURT and THEODORE N. BARNDALL, 2nd, Bradford, Pa. Filed Dec. 27, 1904. Serial No. 238,480.



Claim.—1. A druggist's label-holder, comprising a drawer divided into several compartments adapted to receive rolls of labels in the form of a continuous strip, and upwardly-swinging combined guide, cutter and tension device within each of said compartments.

2. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, and an upwardly-swinging combined guide, cutter and tension device.

3. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, and an upwardly-swinging combined guide, cutter and tension device adapted to support the labels with the gummed side downward, and but a small portion thereof in engagement with the guide.

4. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment provided with an upwardly-swinging combined guide and cutter adapted to support the label on the under side thereof and a tension device carried by said guide and engaging the under side of said strip of labels.

5. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment provided with an upwardly-swinging combined guide, cutter and tension device adapted to support the labels on the under side thereof with the gummed side downward, and out of engagement with the guide and exposing the said gummed surface.

6. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment provided with an upwardly-swinging combined guide, cutter and tension device formed of a single piece of metal and adapted to support the labels on the under side with the gummed side downward.

7. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment provided with an upwardly-swinging combined guide and cutter, downwardly and inwardly turned flanges adjacent the outer end of said guide and adapted to hold the labels on the under side of the same with the gummed side downward, and an arm formed as a part of said combined guide and cutter and adapted to engage the lower gummed side of the label and hold the same frictionally against the under side of the combined guide and cutter.

8. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, of a transverse bar adjacent the rear of said compartment, and a combined guide and cutter pivotally mounted on said bar and extending out beyond the front edge of said compartment.

9. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment having a transverse bar adjacent its upper rear end, and a combined guide and cutter pivotally mounted on said bar and extending out beyond the front edge of said compartment and adapted to frictionally support the label and hold it to the under side thereof with the gummed side downward.

10. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, said compartment having a transverse bar adjacent its upper rear edge and a combined guide and cutter pivotally mounted on said bar and extending outwardly beyond the front edge of the said compartment, and downwardly and inwardly turned flanges adjacent the front end of the guide and resting upon the front end of the compartment, and serving as a guide for the lower gummed face of the labels.

11. A druggist's holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip of a combined guide and cutter adapted to support the strip with the gummed side downward, and a downwardly and inwardly turned flange adapted to support the labels and engage but a small portion of the gummed surface of the label.

12. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, a combined guide and cutter pivotally mounted within the compartment and having downwardly and inwardly turned flanges adjacent the front end of the guide, and said flanges resting upon the front edge of the compartment and serving as a guide for the lower gummed face of the labels.

13. A druggist's label-holder, comprising a compartment adapted to receive a roll of labels in the form of a continuous strip, a combined guide and cutter pivotally mounted within the compartment and having downwardly and inwardly turned flanges adjacent the front end of the guide and said flanges resting upon the front edge of the compartment and serving as a guide for the lower gummed face of the labels, and a tension-arm formed integral with the guide and cutter and engaging the lower gummed face of the labels.

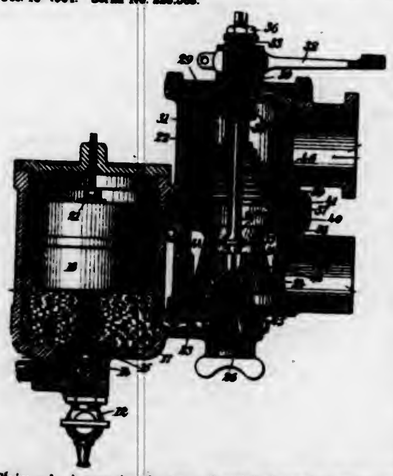
14. A druggist's label-holder, comprising a receptacle divided into several compartments adapted to receive rolls of labels in the form of continuous strips, said receptacle having a transverse bar intersecting the rear portion of each compartment, and forming a guide over which the strip passes, and a combined guide and cutter pivoted on said bar within each of the said compartments, and extending forward and resting upon the front edge of the said receptacle

15. A druggist's label-holder, in the form of a drawer divided into several compartments adapted to receive rolls of labels in the form of continuous strips, a bar extending longitudinally of said drawer and intersecting the said compartments adjacent their rear ends, and a combined guide and cutter pivotally mounted within each of said compartments on said bar, and extending beyond the front edge of said drawer and serving as a guide and cutter for said labels.

16. A druggist's label-holder in the form of a drawer divided into several compartments, adapted to receive rolls of labels in the form of continuous strips, a bar extending longitudinally of said drawer and intersecting the said compartments adjacent their rear ends, a combined guide and cutter pivotally mounted on said bar within each of said compartments and having downwardly and inwardly turned flanges adjacent the front end of the guides, and said flanges resting upon the front edge of said drawer and serving as a guide for the lower gummed face of the labels, and tension-arms formed integral with said guide and cutters and engaging the lower gummed faces of the labels within the compartments.

17. A druggist's label-holder in the form of a drawer divided into several compartments adapted to receive rolls of labels in the form of continuous strips, a bar extending longitudinally of the drawer and intersecting the said compartments adjacent their rear ends, the front walls of said compartments having recessed portions therein, a combined guide and cutter pivotally mounted on said bar within each of said compartments, and having downwardly and inwardly turned flanges adjacent the front end of the guides, and said flanges resting upon the bottom of said recesses in the front edge of said drawer and serving as a guide for the lower gummed face of the labels and tension-arms formed integral with said guide and cutter and engaging the lower gummed faces of the labels within the compartments.

810,792. **CARBURETER.** JAMES MCINTOSH, Lansing, Mich. Filed Oct. 15 1904. Serial No. 228,563.



Claim.—1. A vaporizer having a liquid-fuel-supply nozzle with a valve-seat intermediate its ends, a throat surrounding said nozzle and adapted to have an air-current pass through it, said throat contracting toward the discharge end of the vaporizer, a valve coacting with the seat in and commanding the discharge-nozzle, and a fluted or ribbed stem extending from the valve through the discharge portion of the seat, for the purpose specified.

2. A vaporizer having a valve to throttle the mixture passing from the vaporizer, a liquid-fuel-supply nozzle, a spraying-valve coacting therewith, and a connection between the two valves to turn the latter upon turning the former.

3. A vaporizer having a liquid-fuel-supply nozzle, a throat surrounding said nozzle and adapted to have an air-current pass through it, said throat contracting toward the discharge end of the vaporizer, a valve commanding the discharge-nozzle, a fluted or ribbed stem extending from the valve for the purpose specified, and said stem having a deflector collar or enlargement above its said ribs and within the throat.

4. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-fuel-supply nozzle leading into the casing intermediate said inlet and outlet orifices, and an automatic mixing-valve comprising a throat surrounding the nozzle, a yieldingly-seated valve proper above the throat, and an annular baffle above said valve proper.

5. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-fuel-supply nozzle leading into the casing intermediate said inlet and outlet orifices, an automatic mixing-valve comprising a throat surrounding the nozzle, a yieldingly-seated valve proper above the throat, and a wall rising from the valve proper, the casing having walls forming an air-chamber surrounding the said wall of the valve, and the said wall of the valve being orificed to communicate with said air-chamber for the purpose specified.

6. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-supply nozzle leading into the casing intermediate said inlet and outlet orifices, an automatic mixing-valve comprising a throat surrounding the nozzle, a yieldingly-seated valve proper above the throat, and a wall rising from the valve proper, the casing having walls forming an air-chamber surrounding the said wall of the valve, and the said wall of the valve being orificed to communicate with said chamber for the purpose specified, and an annular interior baffle extending around the said wall of the valve above the orifice therein.

7. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture and also having a valve-seat and walls forming an air-chamber above the seat, a supply-nozzle extending into the vaporizer intermediate said inlet and outlet orifices, an automatic mixing-valve located in the casing and comprising a throat surrounding the nozzle, a valve proper above the throat and bearing on the said seat, and a wall rising from the valve proper and lying opposite the air-chamber in the casing, said wall of the valve being orificed opposite the air-belt for the purpose specified.

8. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture and also having a valve-seat and walls forming an air-chamber above the seat, a supply-nozzle extending into the vaporizer intermediate said inlet and outlet orifices, an automatic mixing-valve located in the casing and comprising a throat surrounding the nozzle, a valve proper above the throat and bearing on the said seat, and a wall rising from the valve proper and lying opposite the air-chamber in the casing, said wall of the valve being orificed opposite the air-chamber for the purpose specified, and an annular interior baffle carried by said wall of the valve above the orifice therein.

9. A vaporizer having a liquid-fuel-supply nozzle, a throat surrounding said nozzle and adapted to have an air-current pass through it, said throat contracting toward the discharge end of the vaporizer, and the liquid-fuel nozzle having a valve-seat therein intermediate its ends, a valve coacting with said seat, a stem connected to the valve and having a fluted or ribbed portion directly adjacent thereto, said fluted or ribbed portion extending through the discharge portion of the nozzle, and a deflector carried by the stem opposite the said nozzle and within the throat.

10. A vaporizer comprising a casing having inlet and outlet orifices, a seat located intermediate the orifices, walls forming an air-chamber adjacent to the seat, a liquid-supply nozzle leading into the casing, an automatic mixing-valve comprising a normally opened throat, a valve proper coacting with the seat of the casing, and an upwardly-extending wall lying opposite said air-chamber and formed with an orifice therein.

11. A vaporizer comprising a casing having inlet and outlet orifices, a seat located intermediate the orifices, walls forming an air-chamber adjacent to the seat, a liquid-supply nozzle leading into the casing, an automatic mixing-valve comprising a normally opened throat, a valve proper coacting with the seat of the casing, an upwardly-extending wall lying opposite said air-chamber and formed with an orifice therein, and an inwardly-extending annular baffle carried by said wall of the mixing-valve above the orifice therein.

12. A vaporizer comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-supply nozzle leading into the casing intermediate said inlet and outlet orifices, an

automatic mixing-valve controlling an auxiliary air-supply, a valve to throttle the mixture passing from the vaporizer, a tubular stem for operating the valve, a valve commanding the liquid-supply nozzle, a spring engaging the automatic mixing-valve, a tube threaded in the tubular stem of the throttle-valve, and a stem attached to the supply-nozzle valve and threaded in the tube.

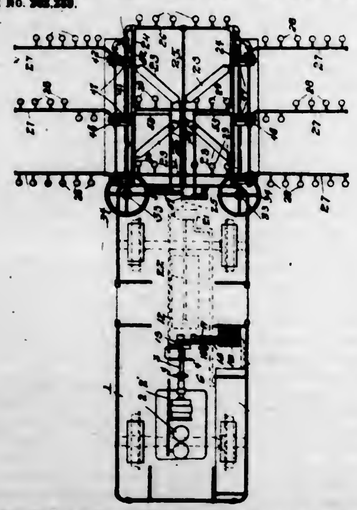
13. A vaporizer having a casing with inlet and outlet orifices respectively for the air and mixture, said casing having a seat between said orifices and walls forming an air-chamber above the seat, a liquid-supply nozzle leading to the casing intermediate the inlet and outlet orifices, an automatic mixing-valve comprising a throat adjacent to the supply-nozzle, a valve proper at the upper end of the throat, the valve proper coacting with the end of the seat of the casing, a wall extending upward from the valve proper and lying opposite said air-chamber of the casing, the wall having a perforation therein communicating with the air-chamber, and means for yieldingly seating the automatic mixing-valve.

14. A vaporizer, comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-fuel supply entering the casing intermediate said inlet and outlet, the casing having a valve-seat between the fuel supply and mixture outlet, an air-chamber between the valve-seat and mixture-outlet, and a yieldingly-seated mixing-valve adapted to be opened by the fluid current through the casing, said valve acting with said seat and having an orificed wall extending over the air-chamber.

15. A vaporizer, comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-fuel supply entering the casing intermediate said inlet and outlet, the casing having a valve-seat between the fuel supply and mixture outlet, an annular air-chamber between the valve-seat and mixture-outlet, and a yieldingly-seated mixing-valve adapted to be opened by the fluid current through the casing, said valve acting with said seat and having an orificed wall extending over the air-chamber.

16. A vaporizer, comprising a casing having inlet and outlet orifices respectively for the air and mixture, a liquid-fuel supply entering the casing intermediate said inlet and outlet, the casing having a valve-seat between the fuel supply and mixture outlet, an air-chamber between the valve-seat and mixture-outlet, a yieldingly-seated mixing-valve adapted to be opened by the fluid current through the casing, said valve acting with said seat and having an orificed wall extending over the air-chamber, and an inwardly-extending baffle carried by the wall between the orifice thereof and the mixture-outlet.

810,793. VEGETATION-DESTROYER. WILLIAM R. MCKEEN, Jr., and ARTHUR H. PETTERS, Omaha, Nebr. Filed May 25, 1905. Serial No. 262,289.



Claim.—1. In apparatus of the class described, in combination, a vehicle, a laterally-projecting burner-carrying arm mounted thereon, and means upon said vehicle for swinging said arm about a substantially vertical axis toward a position parallel to said vehicle.

2. In apparatus of the class described, in combination, a vehicle a burner-carrying arm laterally projecting from said vehicle and pivotally mounted thereon, means upon said vehicle adapted to supply fuel to said burner-carrying arm, and means upon said vehicle adapted to swing said burner-carrying arm about a substantially vertical axis into a position in which the same is substantially parallel to said vehicle.

3. In apparatus of the class described, in combination, a car, an internal-combustion engine mounted on said car, means adapted to drive such car from said internal-combustion engine, a source of hydrocarbon-supply for said internal-combustion engine mounted upon said car, connections between said source of supply and said engine, weed-burning arms mounted upon said car, connections between said source of supply and said weed-burning arms adapted to supply hydrocarbon thereto, and means upon said car adapted to swing said arms in a plane extending parallel to said car.

4. In apparatus of the class described, in combination, a vehicle, a laterally-projecting weed-burning arm mounted upon said vehicle, means upon said vehicle adapted to swing said arm about a substantially vertical axis, and means upon said car adapted to swing said arm about a substantially horizontal axis.

5. In apparatus of the class described, in combination, a car, a laterally-projecting weed-burning arm mounted upon said car, means upon said car adapted to swing said arm about a substantially vertical axis and independent means thereon adapted to swing said arm about a substantially horizontal axis.

6. In apparatus of the class described, in combination, a car, a laterally-projecting weed-burning arm mounted upon said car, means upon said car adapted to swing said arm about a substantially vertical axis, means thereon adapted to swing said arm about a substantially horizontal axis, and means adapted to lock said last-mentioned means in predetermined positions.

7. In apparatus of the class described, in combination, a car adapted to travel upon a track, weed-burning means mounted upon said car parallel to said track, and adapted to coact with the ground comprised between the rails thereof, a relatively movable weed-burning arm upon each side of said car and means upon said car adapted to swing said arms in a plane parallel thereto.

8. In apparatus of the class described, in combination, a car, a shaft upon said car, a burner-carrying arm adapted to swing about said shaft, a gear upon said burner-carrying arm, a gear upon said shaft meshing with said first-mentioned gear and adapted to swing said arm in a plane extending parallel to said car, means upon said car adapted to rotate said shaft and means upon said car adapted to swing said arm about said shaft.

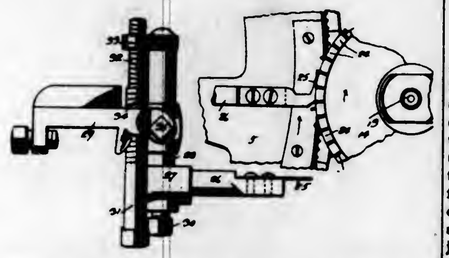
9. In apparatus of the class described in combination, a car, a shaft upon said car, a burner-carrying arm adapted to swing about said shaft, a gear upon said burner-carrying arm, a gear upon said shaft meshing with said first-mentioned gear and adapted to swing said arm in a plane extending parallel to said car, means upon said car adapted to rotate said shaft, means upon said car adapted to swing said arm about said shaft, a source of fuel-supply upon said car and connections adapted to transmit fuel from said source of supply to said arm irrespective of the position thereof.

10. In apparatus of the class described, in combination, a car, a series of burner-carrying arms mounted thereon and adapted to swing in planes transverse of said car, a plate extending longitudinally of said car and projecting beneath said burner-carrying arms, and means upon said car adapted to swing said plate and said burner-carrying arms, and lock the same in predetermined positions.

11. In apparatus of the class described, in combination, a car, an internal-combustion engine mounted upon said car, means adapted to drive said car from said internal-combustion engine, a source of hydrocarbon-supply for said internal-combustion engine mounted upon said car, connecting means between said source of supply and said engine, a weed-burning arm mounted upon said car, connecting means between said source of supply and said weed-burning arm adapted to supply hydrocarbon thereto, an air-compressor upon said car driven from said engine a tank upon said car connected with said air-compressor and adapted to store air compressed thereby, and carbureting means for said hydrocarbon mounted upon said car and connected with said tank and with said source of supply.

810,794. KNITTING-MACHINE. JAMES MCNAMEE, Philmont, N. Y. Filed July 24, 1903. Serial No. 170,978.

Claim.—1. A machine of the class described having a revolubly-mounted alining-wheel provided with peripheral notches, corresponding in depth with the combined diameters of the number of the needles to be alined, and a stationary cam coacting with the alining-wheel to direct the required number of needles into such notches thereof as said notches successively pass said cam.



2. A machine of the class described having a revolubly-mounted alining-wheel provided with needle-alining notches, a stationary cam coacting with the alining-wheel to direct the required number of needles into such notches thereof as said notches successively pass said cam, and means to adjust said cam.

3. A machine of the class described having a revolubly-mounted alining-wheel provided with appropriately-spaced peripheral notches corresponding in depth with the combined diameters of the needles to be alined, a stationary cam coacting with the alining-wheel to direct the required number of needles into such notches thereof as said notches successively pass said cam, and a push-down shoe to carry the loops on the alined needles below the tops of such needles until the latter reach the cloth-wheel.

4. An attachment for knitting-machines comprising an alining-wheel having radial notches formed therein to successively engage each alternate needle in the machine, and teeth to engage and spring inwardly each intermediate needle, a cam-plate having a straight edge with which is engaged said sprung needle and whereby the latter is forced into the notch of the alining-wheel with the needle naturally entering the same, a curved edge being formed on said cam-plate to coincide with and engage the ends of the teeth of said alining-wheel thereby closing the notch containing the two needles and firmly holding the latter in said notch, means to engage the thread-loop of the latter needle with the sprung needle, means to thus hold the loops on said needles after the same are disengaged from said alining-wheel, means to force the threads down on said needles, means to close the beard of one needle, and means to disengage the thread-loop from the same, substantially as described.

5. In a machine of the class described, the combination of a revolubly-mounted alining-wheel having radial peripheral notches, a stationary cam-plate having a front cam-face converging to the alining-wheel to direct the required number of needles into such notches thereof, and a curved face presented to the periphery of the alining-wheel to retain the needles in such notches during a partial rotation of the alining-wheel.

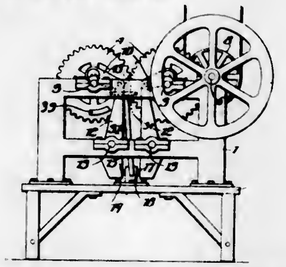
6. A machine of the class described having a revolubly-mounted alining-wheel having peripheral alining-notches, a stationary cam coacting with the alining-wheel to direct the required number of needles into the notches thereof, as such needles successively pass said cam, and a relatively fixed push-down shoe to carry the loops on the alined needles below the tops of such needles until the latter reach the cloth-wheel.

7. An attachment for knitting-machines comprising a pivoted yieldingly-mounted alining-wheel, having formed therein radially-disposed notches to engage each alternate needle and teeth to engage and spring inwardly each intermediate needle, an adjustably-mounted cam-plate to force said sprung needles into the notches of the alining-wheel with the needle that has naturally entered the same, a pivoted adjustably-mounted push-down wheel to engage the thread-loop of the latter needle with the sprung needle, a push-down shoe to hold said thread-loops on said needles after the latter are disengaged from said alining-wheel, a pivoted, adjustably-mounted cloth-wheel to force said loops down on the needles below the points of the beards, a pivoted, adjustable and yieldingly-mounted cut presser-wheel adapted to close the beard of one of said needles, a pivoted adjustably-mounted landing-wheel having an annular series of obliquely-disposed teeth or blades adapted to engage said needles and raise the thread-loops thereon and a pivoted adjustably-mounted cast-off wheel adapted to engage said needles and raise the thread-loops above the same thereby casting off the loop from the closed-beard needle, substantially as described.

810,795. WIRE-STRETCHER. CHARLES R. MCPHERSON, Mesaga, N. D. Filed May 31, 1905. Serial No. 262,163.

Claim.—A wire-stretcher comprising a frame including spaced side members and intermediate end blocks having perforations therein, a shaft journaled in the frame and extending at one end beyond a side member, a drum mounted upon the shaft and provided at one end with ratchet-teeth, a rope engaged with the drum, a lug secured upon the inner face of one of the side members and having a socket therein, a pawl pivoted to the last-named side member adjacent to the lug, said pawl having oppositely-extending fingers, one of said fingers lying normally in engagement with the ratchet-teeth of the drum, a downwardly-exteading projection formed upon the other of said fingers, a helical spring disposed upon the projection, said projection and spring being disposed in the socket of the lug to hold the first-named finger normally in engagement with the ratchet-teeth, and a double crank-arm engaged with the projecting portion of the shaft.

810,796. PUNCHING-MACHINE. JOHN NELSON, Ottawa, Kans. Filed Oct. 5, 1905. Serial No. 281,501.



Claim.—1. In a tube-punching machine of the character described, the combination with a supporting-frame, of a pair of punching-levers pivotally mounted therein, punches removably secured in the lower ends of said levers, crank-shafts revolubly mounted in said frame, links to connect the upper ends of said levers with the cranks on said shafts, means whereby said shafts are driven to operate said levers, a die-holder, a die removably connected thereto, and means to automatically eject or discharge the punched tubes from said die, substantially as described.

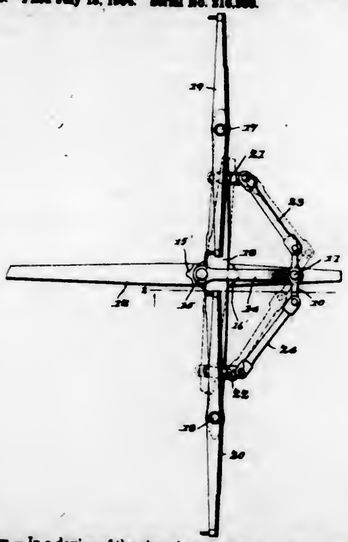
2. In a machine for punching tubular metal, the combination with a supporting-frame, of a pair of punching-levers pivotally mounted therein, punches removably secured in the lower end of said levers, crank-shafts journaled in said frame, links to connect the upper ends of said levers with the cranks on said shafts, intermeshing gear-wheels fixedly mounted on said crank-shafts, a main drive-shaft, a pinion to engage one of said gear-wheels, a die-holder, a die removably connected to said holder, and an automatically-operated discharge mechanism adapted to remove the punched tubes and the punched-out metal from said die, substantially as described.

3. In a machine for punching tubular metal, the combination with a supporting-frame, of a pair of punching-levers pivotally mounted therein, punches removably secured in the lower end of said levers, crank-shafts journaled in said frame, links to connect the upper ends of said levers with the cranks on said shafts, intermeshing gear-wheels fixedly mounted on said crank-shafts, a main drive-shaft, a pinion to engage one of said gear-wheels, a die-holder, a hollow die removably connected to said holder, a discharge-lever pivotally mounted in said frame, an ejector-plate slidably mounted on said die, a discharge-head connected to said plate and to the lower end of said lever, and means to automatically operate said lever after each operation of the punching mechanism, substantially as described.

4. In a machine for punching tubular metal, the combination with a supporting-frame, of a pair of punching-levers pivotally mounted therein, punches removably secured in the lower end of said levers, crank-shafts journaled in said frame, links to connect the upper ends of said levers with the cranks on said shafts, intermeshing gear-wheels fixedly mounted on said crank-shafts, a main drive-shaft, a pinion to engage one of said gear-wheels, a die-holder, a discharge-lever pivotally mounted in said frame, a tube-ejector plate

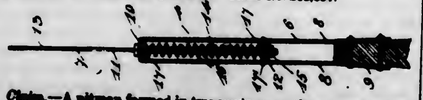
slidably mounted on said die, a discharge-head, guide-rods connecting said head and plate, a centrally-disposed cleaning-rod connected to and operated by said head to remove the punched metal from said hollow die, a pivotally-mounted discharge-lever loosely connected at its lower end to said head, and a cam-lug arranged on one of said gear-wheels to engage and operate said lever, substantially as described.

810,797. DRAFT-EQUALIZER. GEORGE T. NICHOLAS, Bethany, Mo. Filed July 18, 1904. Serial No. 216,869.



Claim.—In a device of the class described, the combination with a tongue having a wear-plate secured thereto, of a doubletree pivotally mounted on the tongue and provided with a bearing-clip having an extension projecting beneath said doubletree and bearing against the wear-plate, an equalizing-lever pivoted to the tongue and having arms of equal length extending laterally in opposite directions from said tongue and provided with alined terminal openings, said lever being pivoted to the tongue in the rear of the doubletree and having a fixed center of movement, a keeper the forward end of which engages the top of the doubletree, the opposite end thereof being interposed between the tongue and the equalizing-lever, a bolt mounted in the bearing-clip and engaging the forward end of the keeper, a bolt passing through the rear end of said keeper and equalizing-lever and serving to pivotally support the latter on the keeper, supporting-clips secured to the doubletree on each side of the tongue and spaced from said tongue a distance greater than the length of the equalizing-arms, and reversely-inclined links pivoted in the terminal openings of the equalizing-arms and also pivoted to the supporting-clips whereby when the doubletree is operated the links and lever will be alternately moved into longitudinal alinement and limit the movement of said doubletree.

810,798. EXTENSIBLE PITMAN-ROD. WILLIAM R. O'NEILL, Findlay, Ohio. Filed July 3, 1905. Serial No. 268,697.



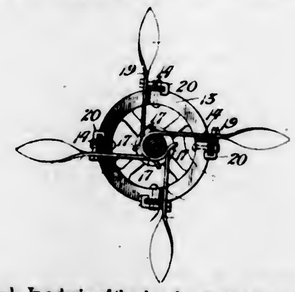
Claim.—A pitman formed in two parts or sections, one of which consists of an open frame 7, having at one end an integrally-formed, apertured part 12, a bail or yoke 8 to engage said open frame, and form the other part or section of said pitman, said yoke having at its inner end an integral apertured part 10 a bolt 14 arranged in said apertured parts to connect the sections of said pitman together, a spring arranged on said bolt between said parts, and apertured guide-plates 17 arranged on the bolt between the ends of the spring and said apertured parts, said plates having guide-recesses formed in their edges to receive the side bars of the frame and yoke forming the pitman, substantially as described.

810,799. MEASURING DEVICE. JOSEPH W. PAGE, Charlotte, N. C. Filed Mar. 3, 1905. Serial No. 248,318.

Claim.—1. A device of the class described comprising a vessel having a movable bottom and a guide-slot, a guideway carried by the vessel in line with said slot, a guide member attached to the bottom and movable through the guideway, said member serving as a closure for the guide-slot, and means for fixing the bottom in adjusted positions.

2. A device of the class described comprising a vessel having a movable bottom and a guide-slot, a graduated scale provided on the vessel adjacent the slot, a guideway carried by the vessel in line with the guide-slot, a guide member attached to the bottom and movable through the guideway, said member serving as a closure for the guide-slot, a pointer movable with the bottom and cooperating with the scale to determine the movements of the bottom, and means for fixing the bottom in adjusted positions.

810,800. HARROW. ANDREW C. PALMER, Washington, Ind. Filed Apr. 27, 1905. Serial No. 257,701.



Claim.—1. In a device of the class described, a drum comprising a central shaft, end heads fixed thereon and webs attached to the heads, cutting members having portions for engagement with the central shaft, and means for attaching the cutting members to the webs.

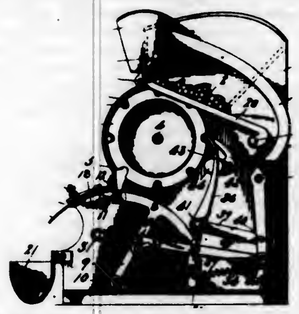
2. In a device of the class described, a rotary drum comprising a central shaft, end heads, and a plurality of webs attached to said heads, blades having spring-engaging portions for engagement with the central drum-shaft, and means for attaching the blades to the webs.

3. In a device of the class described, a rotary drum comprising a central shaft, end heads fixed thereon, and a plurality of webs attached to the heads, cutting members having their inner ends engaged with the central shaft, and clip-bolts for attaching the members to the webs.

4. In a device of the class described, a rotary drum comprising a central shaft, end heads and a plurality of webs attached to said heads, blades provided with hooked end portions engaging the shaft, and clip-bolts for attaching the blades to the webs.

810,801. CIGAR-CLIPPER AND MATCH-SAFE. VICTOR H. PARADIS and JOHN B. PUTNOW, Rice Lake, Wis. Filed Feb. 15, 1905. Serial No. 245,797.

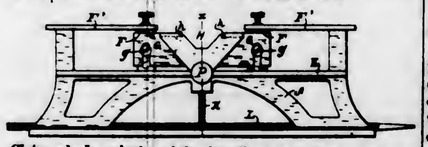
Claim.—1. In a device of the character described a casing, means for projecting a night match without the casing, means provided in the path of the said movement of the match for igniting the same, means for supporting the ignited match near its ends, a receptacle located under the said supporting means, and means adapted to positively project the match into the said receptacle when it is partially consumed.



2. In a device of the character described, a casing adapted to contain matches, a receptacle adapted to receive burned matches, a carrier adapted to support a single match adjacent to its ends and to project it laterally without the casing, means provided in the path of said movement for igniting the match, a spring capable of holding the match upon the carrier adjacent the receptacle until partially consumed and then forcing it downward into the receptacle, a lever pivotally mounted within and extending without the casing and means whereby the operation of the lever actuates the carrier.

3. In a device of the character described, a case, a hopper within the case adapted to contain matches, a drum provided with longitudinally-disposed grooves mounted to rotate within the case and in communication with the hopper, a carrier mounted to oscillate adjacent to and in conjunction with the drum, means adapting the carrier to project a single match without the case, a spring secured to the case and disposed to bear and hold a match upon the carrier until removed, a serrated surface disposed in the path of the match-head and adapted to contact therewith, a receptacle disposed adjacent the carrier and to receive partially-consumed matches therefrom, a finger disposed to rotate the drum through part of a revolution, a pawl disposed to engage with and prevent retroaction movement of the drum, a spring secured to and adapted to oscillate the carrier to project a match, a link adapted to retract the carrier against the tension of the spring, means for disengaging the carrier from the link when at the extreme of its inward movement, a lever pivoted within and extending without the case, a cigar-clipper mounted upon the lever, a knife pivotally mounted within the clipper-body, means whereby the pressure of a cigar upon the clipper depresses the lever and actuates the knife and means whereby the depression of the lever operates the drum and carrier simultaneously and supplementary one to the other.

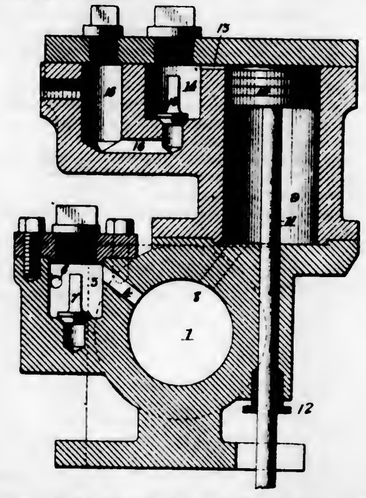
810,802. SAW GAGE AND JOINTER. LEMUEL W. PARKHURST, Tvana, Wash. Filed June 15, 1904. Serial No. 212,660.



Claim.—1. In a device of the described class, the combination with a frame, of a gage member comprising a block having a channel in its under surface adapted to receive the saw-blade, and a transverse recess in its upper surface communicating with the channel; the walls of said recess being faced off at their upper corners at outwardly-divergent angles from the sides of said recess and notched in the plane of said channel; the base of said notch being formed to extend divergently outwardly from the sides of the recess, and convergingly upwardly toward the planes of said faced-off upper corner portions.

2. In a device of the described class, the combination with a frame, of a gage member comprising a block having a channel in its under surface adapted to receive the saw-blade, and a transverse recess on its upper surface communicating with the channel; the walls of said recess being faced off at their upper corners at outwardly-diverging angles from the sides of the recess and provided with notches in the plane of said channel, adapted to constitute a die for the point of the tooth, and formed to permit an outward bending of the point of the tooth when forced into said die; together with means for vertically adjusting said block, whereby the length of the bent portion of the point may be varied.

810,803. CUSHION DEVICE FOR GATES OF WATER-WHEEL CASINGS. CHARLES E. PARSONS, Glens Falls, N. Y. Filed Apr. 1, 1905. Serial No. 253,330.



Claim.—1. An apparatus for gradually restraining a moving body, comprising a housing containing a non-compressible fluid under pressure, and an elastic-fluid cushion of high initial pressure operatively connected with said non-compressible cushion.

2. An apparatus for gradually restraining a moving body, comprising a housing, a piston in said housing adapted to be moved by the moving body, a non-compressible fluid under pressure behind said piston, and an elastic-fluid cushion of high initial pressure operatively connected with said non-compressible fluid.

3. An apparatus for gradually restraining a moving body, comprising a housing, a piston in said housing adapted to be moved by the moving body, a non-compressible fluid behind said piston, an elastic-fluid cushion operatively connected with said non-compressible fluid, and means for relieving the elastic cushion.

4. An apparatus for gradually restraining a moving body, comprising a housing having communicating cylinders, pistons in said cylinders, a non-compressible fluid behind one piston, an elastic cushion behind the other piston, and means connecting said first-mentioned piston with the moving body.

5. An apparatus for gradually restraining a moving body, comprising a housing having communicating cylinders, pistons in said cylinders, a non-compressible fluid behind one piston, an elastic cushion behind the other piston, means connecting said first-mentioned piston with the moving body, and means for relieving the elastic cushion.

6. An apparatus for gradually restraining a moving body, comprising a housing having communicating liquid and air cylinders, pistons therein under balanced pressure, and check-valves interposed between the source of pressure and said pistons.

7. An apparatus for gradually restraining a moving body, comprising a liquid-cylinder, an air-cylinder communicating therewith, pistons in the respective cylinders, a source of liquid and a source of air under pressure communicating with the respective cylinders and check-valves interposed between the pressure source and the respective cylinders.

8. An apparatus for gradually restraining a moving body, comprising a liquid-cylinder, an air-cylinder communicating therewith, pistons in the respective cylinders, a source of liquid and a source of air under pressure communicating with the respective cylinders check-valves interposed between the pressure source and the respective cylinders, and means for relieving the pressure in the liquid-cylinder.

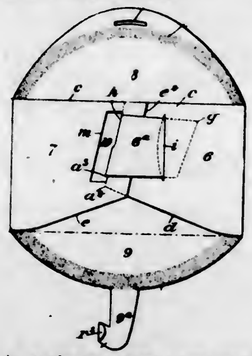
9. An apparatus for gradually restraining a moving body, comprising a liquid-cylinder, an air-cylinder communicating therewith, pistons in the respective cylinders, a source of liquid and a source of air under pressure communicating with the respective cylinders, check-valves interposed between the pressure source and the respective cylinders, and means for relieving the pressure from the back of the air-piston.

10. An apparatus for gradually restraining a moving body, comprising a liquid-cylinder, an air-cylinder communicating therewith, pistons in the respective cylinders, a source of liquid and a source of air under pressure communicating with the respective cylinders, check-valves interposed between the pressure source and the respective cylinders, and means for withdrawing liquid from the liquid-cylinder.

11. A cushioning device comprising a housing containing communicating liquid and air cylinders, pistons therein, and check-valves controlling the exits from said cylinders, the check-valve for the air-cylinder having a liquid seal.

12. A cushioning device comprising a housing containing communicating liquid and air cylinders, pistons therein, check-valves controlling the exits from said cylinders, and a stem on the piston of the air-cylinder projecting from the housing and indicating the position of said piston.

810,804. SAFETY-ENVELOP. JOSEPH PELLERIN, Catalla, Alaska. Filed May 30, 1905. Serial No. 261,333.



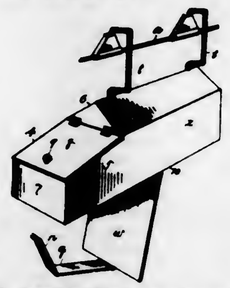
Claim.—1. An envelop comprising a front portion, end flaps foldable toward each other and lapping at their free ends, each end flap having a transverse slot therein near its free end, an extension-flap on the end of one of said end flaps and partly separated therefrom by a transverse slit, the extension-flap being inserted through the slot in the other end flap, then folded at the slit toward and upon the end flap of which it is a portion, the free end of the extension-flap having its free end gummed and moistened, then passed through the slot in the flap upon which it is folded, and cemented thereto by the gum, and side flaps foldable toward each other upon the end flaps and cemented thereon for closure of the envelop.

2. An envelop comprising a front portion, end flaps foldable toward each other and lapping at their free ends, each end flap having a transverse slot therein near its free end, an extension-flap on one of said end flaps and partly separated therefrom by a transverse slit, said extension-flap being passed through the slot in the other end flap, then folded at the slit toward and upon the flap of which it is a portion, the free end of the extension-flap being passed through the slot in the flap upon which it is folded and thereto cemented, a side flap having a transverse slot near its edge, which edge is gummed and cemented upon the end flaps when said side flap is folded thereon, a mating side flap having a tongue extended from its edge that will enter the slot in the other side flap when folded toward said slot, and a hook formed on the end of the tongue at one side edge thereof, said hook being adapted to interlock with the slitted edge of the extension-flap when the tongue is inserted in the slot and the flap from which it extends is folded down on the end flaps.

810,805. DRAFT-GEAR FOR RAILROAD-CARS. HARRY M. PYLKER, St. Louis, Mo. Filed Nov. 9, 1905. Serial No. 286,570.

Claim.—In draft-gear for a railroad-car, the combination with the car-body bolster, of a draw-bar having a suitable coupler, a cross-head on the inner end of the draw-bar opposite to the front side of the bolster, "buffing-springs" movable in and between housings therefor in the face of the cross-head, and in the front side of the bolster, a yoke jointed at its ends to the cross-head and slidable through the bolster transversely thereto, a block straddled by the said yoke opposite to the rear side of the bolster and adapted to be engaged by the said yoke, "draft-springs" movable in and between housings therefor in the face of the said block, and in the rear side of the bolster, flanges projecting from the bolster beneath the said block and cross-head respectively, and means for securing the bolster to the car-body, substantially as described.

810,806. MAIL-BOX. HARVEY L. PIER, Dubuque, Iowa. Filed May 27, 1905. Serial No. 262,616.



Claim.—1. A mail-box having a pendent signal device provided with a cover-securing arm adapted to engage the cover of the box when the signal is raised into concealed position, substantially as specified.

2. The combination with a mail-box having a staple, and a hinged cover adapted to engage said staple when closed, of a pendent signal device provided with a hasp-arm also adapted to engage said staple when the signal is raised into concealed position, substantially as specified.

3. A mail-box having an end extension open at the top, a door for said extension hinged to the end wall of the box, and a pendent signal device hinged to the bottom of the box and having a hasp-arm, and cover-securing means in connection with said hasp-arm, substantially as specified.

4. The combination with a mail-box having a gable top, an end extension open at the top and having a staple, an inclined door hinged to the face wall of said gable top, and adapted to engage said staple when closed, of a pendent signal device hinged to the bottom of the box and having a hinged hasp-arm adapted to engage said staple when the signal is raised into concealed position, substantially as specified.

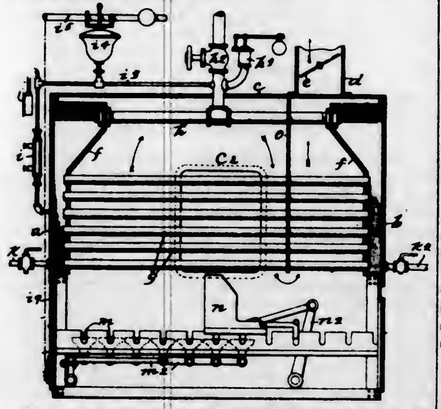
810,807. GUY-ANCHOR. LESTER D. PITCHER, Daytona, Fla. Filed Sept. 5, 1905. Serial No. 277,944.

Claim.—An anchor of the character described comprising a tubular body having a closed tapered end and a spiral rib upon its outer side, said body being also formed with liquid inlet and discharge openings arranged, respectively, adjacent to its upper and lower ends, whereby a liquid may be introduced into the body and discharged adjacent to said point to soften the earth in which the latter is inserted substantially as described.

810,808. SPIKE. JAMES B. PITTMAN, Goldfield, Colo. Filed Feb. 1, 1905. Serial No. 243,070.

Claim.—A spike comprising a head and a stem, the stem directly adjacent to the head being cross-sectionally angular with its side faces converging in the direction of the rail-engaging portion of the head, said spike-stem below said angular portion being tapered downwardly and rounded and having a cross-sectionally rectangular portion at the lower end of the rounded portion and of greater diameter than the rounded portion, the stem below the rectangular portion being cross-sectionally triangular and having upwardly-directed barbs at its edges.

810,809. BOILER. EDWIN POSSETT, New York, N. Y. Filed Aug. 12, 1905. Serial No. 273,882.



Claim.—1. A steam-generator, comprising a front and rear member, and a jacket connecting the same, a casing at each end of said generator, said casings being of greater dimension at their upper ends than at their lower ends, said enlarged portions forming steam-drums, an inlet for one of said casings, an outlet for the other of said casings, water-tubes connecting said casings with each other, a pipe connecting said drums within said jacket and an outlet for said pipe, substantially as shown and described.

2. A steam-generator, comprising the usual casing, a supplemental casing in each end of said first-named casing, said supplemental casings being enlarged at their upper ends, said enlarged portion forming steam-drums, water-tubes connecting the lower portions of said supplemental casings, a steam-pipe connecting the enlarged portions thereof, an inlet for one of said casings, an outlet for the other of said casings and a steam-outlet for said steam-pipe, substantially as shown and described.

810,810. APPARATUS FOR CUTTING AND SLUICING. SAMUEL H. RICHARDSON, Seattle, Wash. Filed July 22, 1904. Serial No. 217,736.

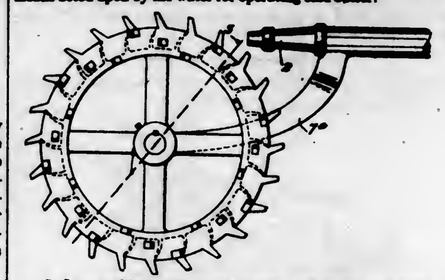
Claim.—1. In an apparatus of the nature indicated, a cutter provided with peripheral teeth and pockets between said teeth, in combination with means for directing a fluid into said pockets, whereby the cutter is operated.

2. In an apparatus of the nature indicated; a cutter provided with impact-surfaces, and a means for discharging a fluid against said impact-surfaces for operating the cutter.

3. In a combined cutting and sluicing apparatus, a cutter, means for directing a fluid to said cutter for operating the same, and means whereby the fluid after operating the cutter will be discharged therefrom to sluice the material excavated.

4. In a combined cutting and sluicing apparatus, a rotary cutter, means for conveying a fluid to a point adjacent the cutter, and means acted upon by the fluid thus conveyed for operating said cutter.

5. In a combined cutting and sluicing apparatus, a cutter, means for directing a fluid to a point adjacent the cutter for sluicing, and means acted upon by the water for operating said cutter.



6. In a combined cutting and sluicing apparatus, a plurality of cutters, a fluid-supply means, and means acted upon by the water from said means for operating said cutters.

7. In an apparatus of the nature indicated, a plurality of cutters, one of said cutters being provided with impact-surfaces, and a nozzle arranged in juxtaposition to said impact-surfaces.

8. In an apparatus of the nature indicated, a plurality of spaced-apart cutters arranged side by side and provided with teeth, the teeth of certain of said cutters being disposed out of alinement with each other, and means for operating said cutters.

9. In an apparatus of the nature indicated, a cutter provided with impact-surfaces, a second cutter movable with the first-named cutter, and means for directing an operating means for the cutters against said impact-surfaces.

10. In an apparatus of the nature indicated, a hollow handle, a pair of arms secured thereto, a cutter mounted for rotation between said arms and being provided with pockets, and a nozzle secured to the inner end of said handle and being in alinement with said pockets.

11. In an apparatus of the nature indicated, a handle, a rotary cutter member supported from said handle, cutters disposed on opposite sides of the said cutter member, and means for operating all of said cutters simultaneously, the axis of rotation of said cutters being at substantially right angles to said handle.

12. In an apparatus of the nature indicated, a handle, a pair of arms secured thereto, a shaft journaled in said arms and projecting on opposite sides thereof, cutters mounted on said shaft, one of said cutters being disposed between said arms, and means whereby said cutters are operated simultaneously.

13. In an apparatus of the nature indicated, a hollow handle, a nozzle secured thereto at one end, and a rotary cutter disposed in advance of the nozzle and being supported from said handle.

14. In an apparatus of the nature indicated, a hollow handle, a nozzle secured thereto at one end, a rotary cutter disposed in advance of the nozzle, and a valve in said handle.

15. In an apparatus of the nature indicated, a hollow handle, a valve therein, a rotary cutter in advance of the handle and being supported thereby, and means whereby the cutter is operated by a fluid passing through the handle.

16. In an apparatus of the nature indicated, a hollow handle, a flexible tube in communication with one end thereof, a nozzle on the other end of said handle, a valve in said handle, and a cutter disposed in juxtaposition to the nozzle and being formed with impact-surfaces movable past said nozzle.

17. In an apparatus of the nature indicated, a hollow handle, a flexible tube in communication with one end thereof, a nozzle on the other end of said handle, a rotary cutter supported from said handle and lying in advance of said nozzle, said cutter being formed with impact-surfaces disposed in alinement with said nozzle.

18. In an apparatus of the nature indicated, a hollow handle, a flexible tube connected to one end thereof, a pair of arms secured to the other end thereof, a shaft journaled in said arms, a plurality of cutters fixed to said shaft, one of said cutters being formed with impact-surfaces, and means for directing fluid from said handle against said impact-surfaces so as to rotate the cutters.

19. In an apparatus of the nature indicated, a hollow handle, a valve therein, a flexible tube connected to one end of the handle, a nozzle secured to the other end of the handle, a pair of arms formed integral with the handle, a shaft journaled in the arms and projecting on opposite sides thereof, a cutter fixed on each end of the shaft, a cutter fixed on the shaft at a point between the arms, said last-named cutter being formed with impact-surfaces disposed in alinement with the nozzle.

20. In an apparatus of the nature indicated, a cutter having peripheral staggered teeth, alternately projecting on opposite sides thereof, and teeth on one of its sides, said last-named teeth also being staggered relatively to each other.

810,811. **COTTON-CHOPPER.** JAMES I. ROBERTS, Sparta, Ga. Filed Nov. 28, 1905. Serial No. 288,731.

Claim.—1. The improved cotton-chopper comprising a rigid horizontal frame having rearwardly-projecting handles, a front roller and a draft attachment comprising a frame pivoted to the main frame and having forwardly-extended converging draft-bars and connected therewith, pendent side bars attached to the rear portions of the main frame and having lateral bends, and a cutting-blade attached to the lower ends of such bars and comprising a horizontal portion and vertical side wings having outturned front ends, substantially as described.

2. In a cotton-chopper the combination with the main frame, pendent bars attached thereto, a cutting-blade connecting the lower ends of such bars and having vertical side wings, a front supporting and draft attachment comprising a yoke which is pivoted centrally to the front bar of said frame, a roller journaled in the pendent portions of such yoke and draft-bars proper rigidly connected with the yoke and converging at their front ends and extending upward at an angle of about forty-five degrees, substantially as described.

3. In a cotton-chopper the combination with a main frame and a front draft attachment comprising a roller and a pivoted frame in which it is journaled, of a cutting-blade arranged horizontally and pendent bars to which the same is attached, the said bars having a lateral bend intermediate of the blade and the frame and means for securing the bars detachably to both the frame and blade whereby they are adapted for convenient detachment and reversal of their bent portions whereby they are adapted for use with blades of varying widths, substantially as described.

4. The improved cultivating implement comprising an oblong rectangular frame provided with rearwardly-projecting handles, a rear cutting attachment comprising a horizontal blade having vertical side wings and rigid bars connecting such blade with the frame, and a front draft and supporting attachment comprising a roller, a yoke in which the roller is journaled, the same being pivoted to the front portion of the main frame and draft-bars rigidly connected with such yoke and extending forward and upward and converging as shown and described.

810,812. **WELDED SHELL.** THOMAS F. ROWLAND, New York, N. Y. Filed Oct. 21, 1903. Serial No. 177,981.

Claim.—1. In welded shells, a shell formed with a recess and with a projecting rib around the same and a projecting attaching-lug formed with an attaching-hole welded into said recess, the peripheral portions of said lug being within said recess and below the level of said rib and the continuity of said shell being uninterrupted adjacent said lug.

2. In welded shells, a shell formed with a recess, a projecting and attaching lug welded to said shell, the peripheral portions of said lug lying within said recess.

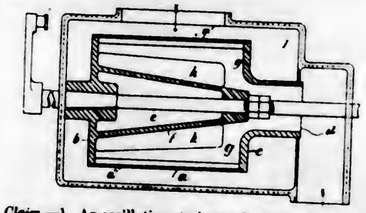
3. In welded shells, a shell formed with a recess and a rigid projecting attaching-lug welded to said shell within said recess.

4. In welded shells, a shell formed with a recess and with a projecting rib around the same and a rigid projecting attaching-lug formed with an attaching-hole welded into said recess, the peripheral portions of said lug being of reduced thickness and being located below the level of said rib and the continuity of said shell being adjacent said lug.

5. In welded shells, a shell formed with a recess, a projecting rib surrounding said recess, said projecting rib extending outward from the surface of the shell, a projecting attaching-lug welded to said shell the welded portion of the lug being within the recess and surrounded by the projecting rib.

6. In welded shells, a shell formed with an irregular contour, such irregularity making a recess in the surface of the shell and a circular rib or projection surrounding the recess and extending outward from a plane of the shell, a rigid attaching-lug welded to said shell within the recess and surrounded by said rib.

810,813. **OSCILLATING CYLINDRICAL PULP-STRAINER.** HERBERT SARGUINETTI, London, England. Filed May 13, 1905. Serial No. 260,126.



Claim.—1. An oscillating strainer-cylinder for paper and cellulose manufacture, provided with partitions, dividing the interior space of the cylinder into compartments, which partitions participate in the oscillating motion of the cylinder, the said partitions being provided with openings so arranged as to establish communication between the various compartments of the cylinder and so as thereby to increase the efficiency of the apparatus by reason of the compensation of pressure afforded in the interior of the cylinder, substantially as described and shown by the drawings.

2. A pulp-strainer comprising an oscillatory cylinder having the wall thereof perforated, a substantially conical-shaped nave extending through the cylinder, suitably connected therewith and facilitating the discharge of the stuff from the cylinder during the operation thereof, and a driven shaft extending through the nave and suitably connected therewith.

3. A pulp-strainer comprising an oscillatory cylinder having the wall thereof perforated, a double-coned-shaped nave extending through the cylinder and facilitating the discharge of the stuff therefrom during the operation of the cylinder, a central stay-partition interposed between the nave and the wall of the cylinder, said partition being perforated, and a driven shaft connected with the nave for oscillating the cylinder.

4. A pulp-strainer comprising a casing provided at one end with a pocket, a rotatable slide arranged in said pocket and constituting a discharge-valve, counterbalanced means for rotatably supporting said slide, an oscillatory strainer-cylinder arranged within said casing, and perforated partitions within said strainer-cylinder.

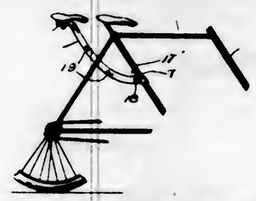
5. A pulp-strainer comprising an oscillatory cylinder having the wall thereof perforated, a closure-plate provided with an outlet and arranged at one end of the cylinder, a closure-plate at the other end of the cylinder, a conical-shaped nave within the cylinder, and a driven shaft extending through said outlet at one end of the cylinder, through the said nave and the plate at the other end of the cylinder and adapted when operated to impart oscillations to the cylinder.

6. A pulp-strainer comprising a casing provided with a pocket having an outlet, a rotatable slide arranged in said pocket and adapted to act as a closure means between the casing and the pocket, an oscillatory cylinder arranged within said casing, and perforated partitions within said strainer-cylinder.

7. A pulp-strainer comprising a casing provided with a pocket having an outlet, a rotatable slide arranged in said pocket and adapted to act as a closure means between the casing and the pocket, an oscillatory cylinder arranged within said casing, perforated partitions within said strainer-cylinder, and a counterbalance means for closing the outlet of said pocket.

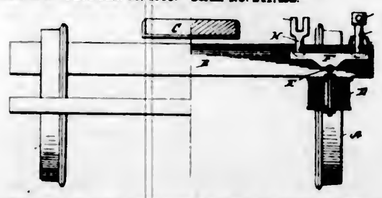
810,814. **BICYCLE ATTACHMENT.** ADOLPHUS P. SAFFELL, Bunnevista, Fla. Filed Apr. 4, 1905. Serial No. 253,515.

Claim.—1. A supplemental seat for bicycles including two members having their lower end portions turned in one direction and hinged together and having their opposite ends turned in the opposite direction and adapted to receive a saddle, and means for holding said members with their hinged end portions in clamping relation.



2. A supplemental seat for bicycles comprising two members having each one end turned laterally and hinged to the corresponding end of the other member, the opposite end of each member being bent laterally in the opposite direction, a saddle removably secured to the last-named laterally-bent portions, and clamping-bolts passed through the members and adapted to hold their hinged end portions in clamping relation.

810,815. **RAILWAY-CAR TRUCK.** FRANCIS P. SHAFFER, Cumberland, Md., assignor of one-third to Patrick W. Cavanaugh, Cumberland, Md. Filed Jan. 16, 1905. Serial No. 241,493.



Claim.—1. In a railway-car truck, the combination with the bolster, of a lever fulcrumed at each end of said bolster, sockets in the ends of said levers, and rods having their lower ends engaging the sockets in the levers.

2. In a railway-car truck, the combination with the bolster having a transverse stud or pin at each end thereof, of a lever pivoted on said stud and having sockets on each end, and rods passing through the top of the bolster and having their lower ends engaging the sockets on the levers.

3. An equalizing device for railway-car trucks, comprising a pair of vertically-movable rods adapted to be arranged at each end of a bolster, and means adapted to be suspended within and at each end of the bolster for receiving the movement of the rods.

4. In a railway-car truck, the combination with a bolster, of a pair of vertically-movable rods arranged in the ends of the bolster, a lever supporting the lower end of each pair of rods, said lever receiving the movement of the rod, and means arranged in the bolster for supporting the lever.

5. In a railway-car truck, the combination with a hollow bolster, of a pair of vertically-movable rods arranged in each end thereof and extending through the top wall of the bolster, and means suspended within the bolster at each end thereof for receiving the movement of the rods.

6. An equalizing device for railway-car trucks, comprising a pair of vertically-movable rods adapted to be arranged at each end of a bolster, and a lever adapted to be suspended within and at each end of the bolster for receiving the movement of the rods.

7. An equalizing device for railway-car trucks, comprising a pair of vertically-movable rods adapted to be arranged at each end of a bolster, a lever adapted to be suspended within and at each end of the bolster for receiving the movement of the rods, and transversely-extending pins arranged in each end of the bolster and adapted to suspend the lever.

8. An equalizing device for railway-car trucks, comprising a pair of vertically-movable rods adapted to be arranged at each end of a bolster, a triangular-shaped vibratory lever arranged at each end of the bolster and each having a pair of sockets adapted to receive the ends of a pair of rods so that the lever will receive the movement of the rods, and a transversely-extending pin arranged in each end of the bolster and adapted to act as supports for the levers.

810,816. **VEGETABLE-DISINTEGRATOR.** NEWTON J. SHEPHERD, Summerville, Pa. Filed Jan. 13, 1905. Serial No. 240,893.

Claim.—In a device for disintegrating vegetables, the combination with a vessel mounted on legs and having a removable foraminated bottom, of an implement adapted to be introduced into said vessel to press the vegetables through said foraminated bottom, the said implement comprising a vessel having a foraminated bottom and a handle.

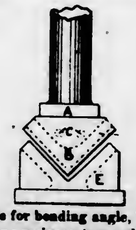
810,817. **ATTACHMENT FOR CULINARY VESSELS.** WILLIAM SOWERBY, Indiana, Pa. Filed Mar. 23, 1905. Serial No. 251,575.

Claim.—1. An attachment for culinary vessels having handles comprising a spring-clamp formed of wire and adapted to engage the handle of the vessel, a plate carried by said clamp, said plate being sheared to form brackets, a strap carried by said plate, a lid hinged to said strap, a rod mounted in said brackets and connected to said lid, the one end of said rod being bent upwardly to form a handle, substantially as described.

2. In an attachment of the character described, the combination with a culinary vessel having a handle and a lid, of a spring-clamp adapted to embrace said handle, a strap carried by said clamp to which said lid is hinged, a reciprocating rod mounted upon said clamp and connected to said lid.

3. An attachment for culinary vessels comprising a clamp composed of spring-wire having a U-shaped arm adapted to engage the underneath surface of a handle and having arms parallel to said U-shaped arm and connected thereto by a coil, a plate carried by said last-named arms, a strap carried by said plate, a lid hinged to said strap and a reciprocating rod, slidably mounted on brackets carried by said plate, and pivotally connected to the said lid.

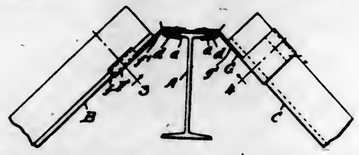
810,818. **MACHINE FOR BENDING METAL BARS.** THOMAS STEVENSON, Dunedin, New Zealand. Filed May 20, 1903. Serial No. 158,055.



Claim.—A machine for bending angle, T and channel irons at right angles, comprising a reciprocatory male die having an angular working face and a stationary female die having an angular working face, said male die provided with a plurality of channels intermediate its ends for the reception of a flange or flanges of the iron, and further provided intermediate the channels thereof with a web-engaging member projecting beyond the face of the portion of the die inter-

posed between the channels and the web-engaging member, said channels being of greater height than the height of the flange of the iron to be bent to form spaces for the reception of the surplus metal formed at the angle of the bend during the operation of bending.

810,819. METAL CLIP FOR UNITING METAL BEAMS. HERBERT A. STRAWBRIDGE, Chicago, Ill. Filed Nov. 3, 1905. Serial No. 285,789.



Claim.—1. The combination with meeting beams or members A, B C extending at angles to each other and in different planes, of a composite sheet-metal clip for securing said beams together and comprising a main clip member D having foldable flanges *d d* for securing the same to one of said beams, and supplemental clip members F G pivotally secured to said main clip member and having foldable flanges *f f* and *g g* for securing the same to the beams or bars, and provided also with bendable shank portions *f' g'* to enable said supplemental clips F G to extend in different planes and different angles as required, substantially as specified.

2. The combination with meeting beams or members extending at an angle to each other and in different planes, of a composite clip for securing said beams together, comprising a main member D having folding flanges *d d* and a supplemental member F pivotally connected to said main member and having folding flanges *f f* substantially as specified.

3. The combination with meeting beams or members extending at an angle to each other and in different planes, of a composite clip for securing said beams together, comprising a main member D having folding flanges *d d* and a supplemental member F pivotally connected to said main member and having folding flanges *f f*, said supplemental clip member F having a bendable shank portion *f'* to adapt the same to extend in a different plane as well as at an angle to the main clip D, substantially as specified.

4. The composite clip for securing metal beams or bars together, comprising a main member having folding flanges and a supplemental member pivotally connected to said main member and having folding flanges, substantially as specified.

5. The composite clip for securing metal beams or bars together, comprising a main member having folding flanges and a supplemental member pivotally connected to said main member and having folding flanges, said supplemental member having a bendable shank portion, substantially as specified.

6. The composite clip for securing metal beams or bars together, comprising a main member having folding flanges and two supplemental members pivotally connected to said main member and provided each with folding flanges, substantially as specified.

810,820. SURGICAL TABLE. JAMES L. SUDDARTH, Washington, D. C. Filed Mar. 7, 1903. Serial No. 146,691.

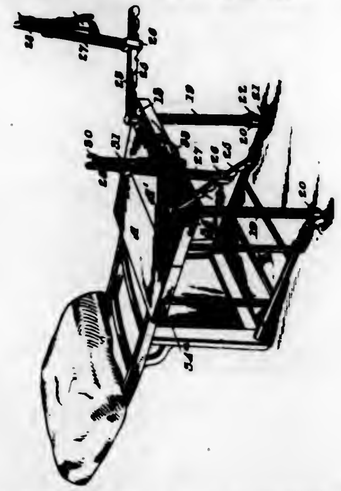
Claim.—1. In surgical appliances, a table comprising leaves provided with retaining devices, a brace engaging said retaining devices to support the leaves to form a table, means forming part of said brace to support one end or edge of the table, and supporting means for the other end of the table.

2. In surgical appliances, a table comprising leaves, a brace adapted to engage the leaves and support them in operative position to form a table and provided with a fastening to secure one end of the table to a suitable support, and means for supporting the other end of the table.

3. In surgical appliances, a table comprising leaves each in the form of a box or case-section, a brace passing through portions of the leaves and connecting them in rigid relation to form a table and provided with a projecting device, to secure one end of the table to a support, and means for supporting the other end of the table.

4. A surgical table, comprising two hinged sections to be opened to form a table, keepers secured to the sections, bars carried by the keepers to hold the sections open and having hooked ends to engage an article with one of the sides of the sections to secure the table in operative position and support one end thereof, and means for supporting the opposite end of the table.

5. A surgical table, comprising two hinged sections arranged to be opened to form a table, keepers secured to the sections, bars slidingly arranged in the keepers to hold the sections open and having their outer ends formed to engage and clamp an article against one of the sides of the sections to hold the table in operative position and support one end thereof, means to hold the bars in adjusted position, and means for supporting the outer end of the table.



6. A surgical table comprising two box-sections hinged together, keepers secured in the ends of the sections, bars adjustably passed through the keepers, and having their ends turned down and projecting beyond the end of the table, means to support the table at its outer end, vertically-adjustable and laterally-movable limb-standards rising from the table and provided with hooks at their upper ends, and limb-securing means hung to the hooks.

7. In a surgical table, two box-sections hinged together, keepers secured in the ends of the sections, bars passed through the keepers and projecting outwardly with their ends bent downward, clamping-screws through the turned-down ends of the bars, and legs at the opposite end of the sections from that through which the bars project.

8. A surgical table, comprising hinged sections to be opened to form a table, a brace connecting said sections to hold the sections open and provided with means to engage an article to secure the table in operative position and to support one end thereof, means for supporting the opposite end of the table, brackets secured to one of the sections and formed with upwardly-opening sockets and pendent studs, legs having their upper ends fitted upon the studs, and limb-supporting devices fitted into the sockets.

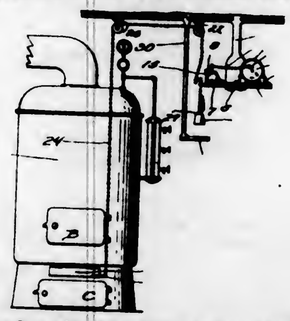
9. A surgical table, comprising hinged sections to be opened to form a table, means embodying a brace to hold the sections open, said brace having a fastening to engage an article to secure the table in operative position and to support one end thereof, means for adjustably supporting the opposite end thereof, horizontally-swinging members mounted upon the table, and limb-supporting standards adjustably mounted upon the members.

10. A surgical table, comprising two hinged sections to be opened to form a table, means adapted to hold the sections open and engage an article to secure the table in operative position and to support one end thereof, brackets secured to one of the sections and consisting of upper plates having formed thereon rigid depending studs having sockets in their upper ends, stop-plates formed with vertical end pieces and through which pass the studs, means passing through the end pieces to secure the stud-plates in applied position, face-plates, means carried by the face-plates to engage the upper plates to secure the studs in applied position, means carried by the studs for supporting the outer end of the table, and limb-supporting means carried by the sockets.

11. A surgical table, comprising hinged sections to be opened to form a table, means embodying a brace to hold the sections open, said brace having a fastening to engage an article to secure the table in operative position and to support one end thereof, means for adjustably supporting the opposite end thereof, horizontally-swinging arms mounted upon a table, vertically-adjustable limb-supporting standards mounted upon the arms, and slings or straps detachably suspended at their upper ends on said standards.

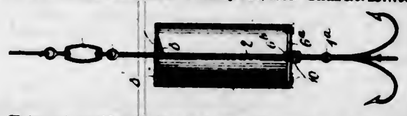
12. A portable surgical table, comprising two box-sections hinged together, keepers in the ends of the sections, rods adapted to engage through the keepers, and having turned-down ends, brackets secured in the outer corners of one of the sections and formed with a rigid depending cylindrical stud having a socket in its upper end, tubular extensible legs having their upper ends fitted to the said studs, laterally-swinging members having depending studs to pivotally engage in the said sockets, vertically-extensible limb-supporting standards having their bases loosely and slidably mounted on the said members, and straps secured to the tops of the extensible limb-supporting standards.

810,821. AUTOMATIC DRAFT-OPENER. JOHN H. THOMPSON, Fitchburg, Mass. Filed Dec. 5, 1904. Serial No. 235,880.



Claim.—In combination a furnace having a draft-opening, a door therefor, a weight, a connection between the door and weight, whereby the drop of the weight will open the door, a suitably-supported shelf, a bracket secured to one end of the shelf, a bell-lever pivoted to the upper portion of the bracket, a lug on one end of the bell-lever, bearings carried by the bracket beneath the bell-lever, a shaft mounted therein, a lever carried by the shaft, an end of the lever being engaged by the lug of the bell-lever, a stop on the bracket for limiting the movement of the lever in one direction, an arm carried by the shaft and adapted to engage the connection and suspend the weight, a time-controlled apparatus on the shelf, a flexible tripping connection between the end of the bell-lever and the apparatus, and means for holding the time-controlled apparatus against displacement.

810,822. LURE FOR USE WITH TROLLER-HOOKS. GEORGE W. TINKHAM, Hubbard, Minn. Filed Apr. 27, 1905. Serial No. 257,760.



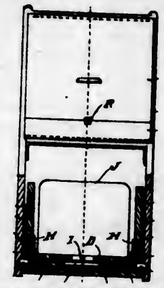
Claim.—An artificial bait or lure comprising an elongated shank or stem, a revolubly-mounted cylinder arranged on said stem, and blades formed in one end of said cylinder whereby the latter will be turned on said stem, substantially as described.

810,823. FILING-CABINET. FRED W. TOBEY, Grand Rapids, Mich. Filed May 12, 1905. Serial No. 260,194.

Claim.—1. In a filing-cabinet, a sliding drawer composed of an upper section and a lower section; and means for holding the same in slidable contact with each other whereby the upper section of the drawer may be drawn forward sliding upon the lower section.

2. In a filing-cabinet, the combination, with the main frame, of a sliding drawer composed of an upper and a lower section in slidable engagement with each other, and a follower forming the back of the upper portion of the drawer and adjustable to and from the front.

3. In a filing-cabinet, the combination with the main frame, of a sliding drawer composed of sides, a sectional front, a tilting back and a bottom, means for adjusting the back to and from the front, and means for permitting the upper portion of the back and one of the sections of the front to move away from each other while the lower portion and the other section of the front retain their relative positions, whereby the contained files may be freely examined while held bound by their lower edges.



4. In a filing-cabinet, the combination with the main frame, of a sliding drawer composed of an upper and a lower section in slidable engagement with each other, a follower forming the back of the upper section of the drawer and adjustable to and from the front, and means for preventing the upper section from moving forwardly upon the lower section.

5. In a filing-cabinet, the combination with the main frame, of a sliding drawer composed of an upper and a lower section in slidable engagement with each other, a follower forming the back of the upper section of the drawer and adjustable to and from the front, means for preventing the upper section from moving forwardly upon the lower section, and means carried by one section and engaging in the other of the sections to prevent the tilting of the sections upon one another.

6. In a filing-cabinet, the combination with the main frame, of an extension-slide arranged therein, a sliding drawer composed of an upper and a lower section mounted upon said frame, rollers carried by the extension-slide, adapted to support the slide and actuated by the sliding drawer, and means for holding the sections of the drawer in slidable contact with each other, whereby the upper section of the drawer may be drawn forward in a sliding manner upon the lower section.

7. In a filing-cabinet, the combination with the main frame, of a sliding drawer composed of an upper and a lower section in slidable engagement with each other, a follower forming the back of the upper portion of the drawer and adjustable to and from the front, and means for detachably connecting the said sections together, said means when in operative position preventing the sliding of one section upon the other and when in inoperative position permitting one of the sections moving forwardly upon the other of the sections.

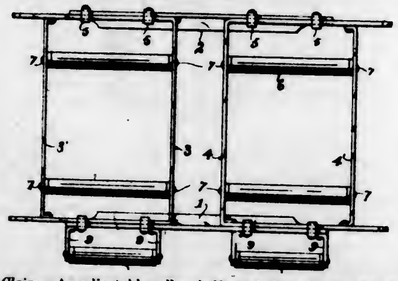
8. In a filing-cabinet, the combination with a main frame, of an extension-slide arranged therein, a sliding drawer composed of an upper and a lower section, supporting-rollers carried by the extension-slide and adapted to be actuated by the sliding drawer, means for holding the sections of the drawer in slidable contact with each other so that the upper section can be slid forward upon the lower section, and means for locking the two sections together to form a unit and to prevent one section moving in advance of the other section.

9. In a filing-cabinet, the combination with a main frame, of an extension-slide arranged therein, a slide-drawer composed of an upper and a lower section, supporting-rollers carried by the extension-slide and adapted to be actuated by the slide-drawer, means for holding the sections of the drawer in slidable contact with each other so that the upper section can be slid forward upon the lower section, means for locking the two sections together to form a unit and to prevent one section moving in advance of the other section, and means carried by one section and engaging in the other of the sections to prevent the tilting of the sections upon one another when withdrawing them from the cabinet.

10. In a filing-cabinet, the combination with a main frame, of an extension member arranged therein, a sliding drawer composed of an upper and a lower section, means carried by one of the sections and engaging in the other of the sections for holding the sections in slidable contact and for limiting the sliding movement of the upper section upon the lower section, and means for locking the two sections together to form a unit and to prevent one section moving in advance of the other section.

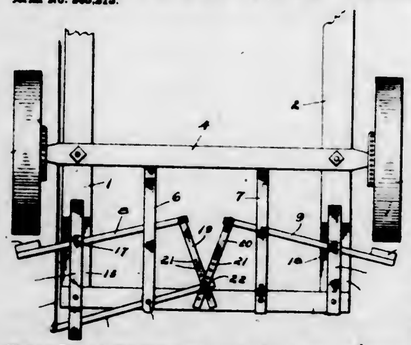
11. In a filing-cabinet, the combination with a main frame, of an extension member arranged therein, a sliding drawer composed of an upper and a lower section, means carried by one of the sections and engaging in the other of the sections for holding the sections in slidable contact and for limiting the sliding movement of the upper section upon the lower section, means for locking the two sections together to form a unit and to prevent one section moving in advance of the other section, and means carried by one section and engaging in the other section to prevent the tilting of the sections from one another when withdrawing the sections from the cabinet.

810,824. SHELF. FRED W. TOBEY, Grand Rapids, Mich. Filed Aug. 10, 1905. Serial No. 273,613.



Claim.—An adjustable roller-shelf consisting of front and rear bars, roller-carrying frames, rollers carried thereby, and means for slidable connection between bars and frames, whereby the frames may be adjusted to and from each other and the length of the shelf may be correspondingly affected.

810,825. BRAKE. MILES TURNER, WILLIAM KERNAGHAN, and CHARLES M. SWINEHART, Steamboat Springs, Colo. Filed June 1, 1905. Serial No. 263,213.

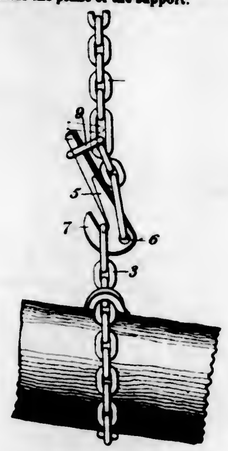


Claim.—The combination with a wheeled frame, comprising sills, a transverse beam at the rear end of the sills, and braces connected to the axle and transverse beam, said sills having their under faces cut away at their rear ends, of guide-plates secured to the under sides of the sills and to the transverse beam and bridging the cut-away portions, brake-beams pivoted between the sills and the guide-plates and provided with shoes disposed to engage the wheels at times, links pivoted to the brake-beams, a lever pivoted to the transverse beam and to the links, and means for shifting the lever.

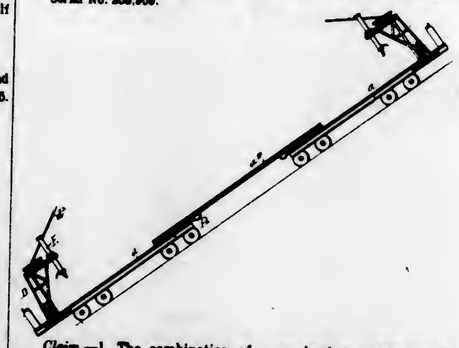
810,826. LOG-HOOK. JAMES D. VAUGHAN, Swoll, La. Filed Jan. 7, 1905. Serial No. 240,118.

Claim.—1. A fastening device having a body provided with means for connecting it with a support located on the rear side thereof, and a hook and an operating-arm on the front side, said hook and arm being above said means when the hook is locked in operative position.

2. A fastening device having a body provided with means located on the rear side thereof for connecting it with a support, and an operating-arm and hook located on the front side of said body, the hook being located below the arm, whereby upon the rotation of the device about said means as a center from a position for engaging a load to a position for supporting a load, the path of movement of the hook will not cross the plane of the support.



810,827. CRANE STRUCTURE FOR CARS. CONSTANTINE B. VOTHOW and GEORGE B. TAYLOR, Philadelphia, Pa. Filed Apr. 4, 1905. Serial No. 253,909.



Claim.—1. The combination of a car having a supporting-framework including side members formed of longitudinally-extending beams, with a crane structure adjustable longitudinally of said car upon said beams and having wheels operative upon and held from vertical movement by the flanges of the beams, substantially as described.

2. The combination of a car having a framework including side members formed of structural sections, a structure having wheels operative upon said sections so as to move longitudinally of the car, and a hoisting device carried by said structure, substantially as described.

3. The combination of a car having a structure longitudinally adjustable thereon, a track on said structure extending transversely of the car, and a hoisting device movable on said track, substantially as described.

4. The combination of a car having longitudinally-extending tracks, a structure having side frames connected together and movable on said tracks, a track extending between said side frames, a carriage movable on said latter track, and a hoisting device supported by said carriage, substantially as described.

5. The combination of a car, longitudinally-extending structural sections at each side of the same, a framework at each end of the car movable upon the said structural sections, said frameworks having portions held from vertical movement by the flanges of said sections, and a crane carried by each framework.

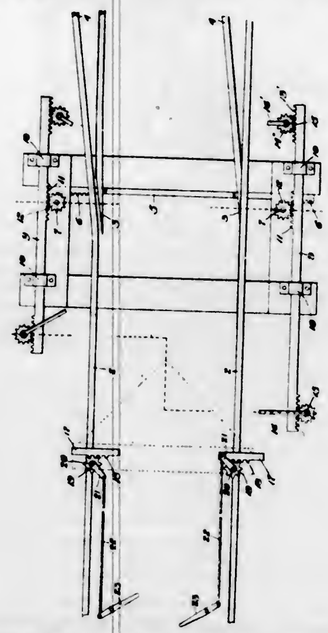
6. A car having at each end a body including two longitudinally-extending beams, a structure having side members provided with rollers operative upon the flanges of said beams, and a hoisting device carried by each of said structures, substantially as described.

7. A car having a pair of longitudinally-extending beams, a framework operative upon said beams, said framework including elongated pieces carrying wheels operative upon the flanges of the beams, side members extending upwardly from said pieces, means for connecting the side members, a guide or guides also extending between the side members, and a hoisting device movable transversely upon said guides, substantially as described.

8. The combination of a car having at each end a frame movable longitudinally of the car, each of said frames having portions overhanging the car, with hoisting mechanism carried upon the overhanging portion of each frame and bodily movable transversely of the car, substantially as described.

9. The combination of a car having two truck-supported end sections and an intermediate section connecting said two end sections, crane structures respectively carried on the end sections so as to be movable longitudinally of the car and hoisting devices on said structures placed to deposit upon or remove elongated objects from the intermediate section, substantially as described.

810,828. SWITCH-OPERATING MECHANISM. GEORGE WARD Homestead, Pa., assignor of one-eighth to Thomas J. Tierney and one-eighth to Frank R. Agnew, Pittsburg, Pa. Filed Aug. 31, 1905. Serial No. 276,517.



Claim.—1. In switch-operating mechanism, the combination with movable switch-points, of a connecting-bar provided with a side rack, a vertical shaft provided with a pinion engaging said rack, a second vertical shaft provided with a laterally-projecting arm, gearing connecting said shaft with the first-named shaft, and contacting mechanism mounted on a movable element arranged to cooperate with said means, substantially as set forth.

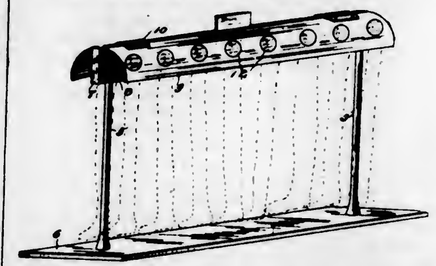
2. In switch-operating mechanism, the combination with movable switch-points, of a connecting-bar provided with a side rack, a vertical shaft provided with a pinion engaging said rack, a second vertical shaft provided with a laterally-projecting arm, gearing connecting said shaft with the first-named shaft, and adjustable contacting mechanism mounted on a movable element arranged to cooperate with said means, substantially as set forth.

3. In switch-operating mechanism, the combination with adjustable switch-points, of a connecting-bar provided with a rack-terminal, a pinion engaging said rack, a pinion adapted to transmit movement to said first pinion, a rack-bar engaging said second pinion provided with a rack extremity, a pinion engaging said rack extremity, and an operating-shaft and lever therefor, substantially as set forth.

4. In switch-operating mechanism, the combination with adjustable switch-points, of a connecting-bar provided with a rack-terminal, a pinion engaging said rack, a pinion adapted to transmit movement to said first pinion, a rack-bar engaging said second pinion provided with rack extremity, a pinion engaging said rack extremity, with an operating-shaft and lever therefor, and a movable track-supported adjustable abutment arranged to engage said lever to transmit motion to said mechanism, substantially as set forth.

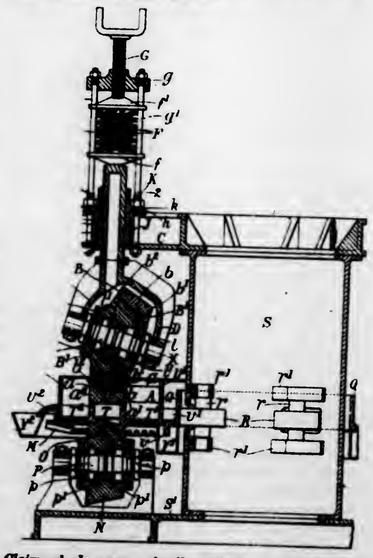
5. The combination with switch-operating mechanism provided with a vertical actuating-shaft having a pinion engaging shifting gearing and a laterally-projecting arm; of an adjustable abutment mounted upon the locomotive, with means for setting said abutment into or out of operative relation with said arm, substantially as set forth.

810,829. DISPLAY-STAND. PHILO M. WARD, Johnson City, Tenn. Filed Feb. 13, 1905. Serial No. 245,433.



Claim.—A display-stand comprising a base; standards rising therefrom; a cross-bar connecting said standards at the top; pins extending outwardly from the side of the cross-bar on both sides thereof, the points of the pins being upwardly presented; and a leaf hinged to each of the upper edges of the cross-bar and normally resting on the points of the pins.

810,830. PAN-AND-ROLLER MILL FOR CRUSHING AND GRINDING. JOHANNES C. WRIGHT, Battlesbridge, England, assignor to The Renfrew Crusher Company Limited, London, England. Filed May 12, 1905. Serial No. 260,979.



Claim.—1. In a pan-and-roller mill, the combination with a pan provided with a horizontal grinding-face upstanding from the bot-

tom of the pan and having its inner and outer faces vertical, of a grinding-roll of truncated conical form disposed with its smaller end toward the interior of the pan, the axis of the roll being set skewwise in the pan and at such an inclination as to enable parallelism to be maintained between the grinding-faces of the pan and roll at their line of bite, the relative widths of said faces being adapted to prevent the formation of a groove or step on either of them, and the marginal portions of the inner and outer ends of the roll being respectively concave and convex so as to be normal to the grinding-face; a dead-axle whereon the roll is mounted to rotate; a yoke-frame straddling the roll and carrying the ends of said axle; a vertical ram integral with said yoke-frame and having its axis alined to intersect the line of bite of the pan and roll at the center of said line; and a bearing in the frame of the mill adapted to permit of said ram moving vertically without turning, substantially as described.

2. In a pan-and-roller mill the combination with each grinding-roll of a yoke-frame wherein the roll is mounted to turn on its own axis, a vertical ram integral with said frame and having its axis alined to intersect the line of bite of the pan and roll at the center thereof, a bush in which the ram is splined so as to be free to slide without turning, a bearing in the frame of the mill wherein said bush is fitted to rotate, and means for angularly adjusting said bush in its bearings so as to enable the roller to be set skewwise in the pan, substantially as specified.

3. In a pan-and-roller mill the combination with each grinding-roll of a yoke-frame wherein the roll is mounted to turn on its own axis, a vertical ram integral with said frame and having its axis alined to intersect the line of bite of the pan and roll at the center thereof, a bush in which the ram is splined so as to be free to slide without turning, a bearing in the frame of the mill wherein said bush is mounted to rotate, means for angularly adjusting the bush or sleeve in said bearing so as to enable the roller to be set skewwise in the pan, and means for applying adjustable spring-pressure to the ram so as to reinforce the weight of the roll, substantially as specified.

4. In a pan-and-roller mill the combination with an annular pan having a vertical inner wall bounding its central aperture and a conoidal bearing-surface on its under side, of supporting-rollers for the pan of truncated conical form mounted to rotate on bearings carried by the foundation of the mill, and adapted to contact with the conoidal bearing-surface of the pan, an upright hollow cylindrical pillar carried by the foundation of the mill concentric with the pan and extending through its central aperture so as to occupy approximately the entire area thereof, openings in the wall of said pillar, and antifriction-rollers mounted to turn on vertical axes so as to project through said openings to contact with the vertical inner wall of the pan, substantially as specified.

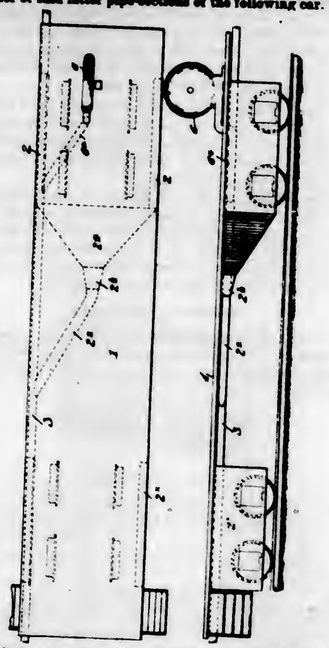
5. In a pan-and-roller mill the combination of an annular pan, an upright cylindrical pillar carried by the foundation of the mill concentric with the pan and extending through its central aperture so as to occupy approximately the entire area thereof, a cantaliver arm projecting from the upper part of said pillar over the pan, a grinding-roll adapted to coact with a race in the pan, a yoke-frame wherein said roll is mounted to turn on its own axis, a vertical ram integral with said frame, a bush wherein said ram is splined so as to be free to slide without turning, a bearing in said cantaliver arm wherein said bush is fitted to rotate, and means for angularly adjusting said bush in its bearing so as to enable the grinding-roll to be set skewwise in the pan, substantially as specified.

810,831. DUST-COLLECTOR FOR CARS. GEORGE F. WEIR, Hibbard, Ind. Filed June 26, 1905. Serial No. 267,417.

Claim.—1. A dust-collector for cars, comprising a chute arranged laterally and outside of the car-wheel truck, and effective to receive the dust thrown up by the action of said wheels, a lateral dust-conducting pipe arranged upon the car, and a diagonal branch-pipe connection between said lateral pipe and said chute.

2. A dust-collector for cars, comprising a chute arranged laterally and outside of the car-wheel truck, and effective to receive the dust thrown up by the action of said wheels, said chute having a tapered delivery rear or inner end member, a lateral dust-conducting pipe-section arranged upon the car, and a diagonal branch pipe effecting connection between said lateral dust-conducting pipe-section and said member.

3. A train dust-collector, comprising a chute arranged upon the lead car, laterally and outside of the wheel-truck, and effective to receive and collect the dust thrown up by the action of the wheels, said car having a lateral pipe-section connected to said collectors and following car equipped with like dust-collectors and lateral pipe-sections having branch-pipe connections with the latter dust-collectors, the lateral pipe-sections of the lead car being interchangeably used with either of said latter pipe-sections of the following car.



4. A dust-collector for cars, comprising a number of chutes arranged laterally and outside of the truck-wheels and opening downward to receive the dust resulting from the action of the truck-wheels, a lateral dust-conducting pipe-section upon the car, an upward and rearward tapered nozzle member fixed to and common with both of said chutes, and a diagonal pipe connection between said tapered member and said lateral dust-conducting pipe.

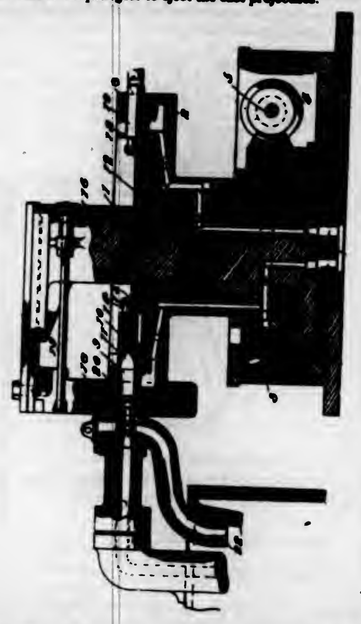
5. A dust-collector for cars, comprising a chute arranged upon the lead car, laterally and outside of the forward truck-wheels and effective to receive the dust resulting from the action of the car truck-wheels, a lateral dust-conducting pipe arranged upon the car, said chutes having connected or fixed to their delivery end an upward and laterally or rearward tapered nozzle member common to both of said chutes, and similar opposite end chutes arranged upon a following car each two of these latter chutes also having a common nozzle member, opposite lateral dust-conducting pipe-sections, and branch-pipe connections between said nozzle members and said lateral dust-conducting pipe-sections arranged to extend in oppositely-diagonal directions from the respective nozzle members of said chutes.

810,832. APPARATUS FOR CASTING PROJECTILES FOR SMALL-ARMS. FREDERICK WEBER, Esher, England. Original application filed Oct. 22, 1903, Serial No. 178,295. Divided and this application filed Mar. 24, 1905. Serial No. 251,577.

Claim.—1. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a series of movable molds each adapted to form a projectile, means for injecting molten metal into the molds, means to move the molds into casting position, and means to feed the hardened portion of a projectile to each mold before it reaches its casting position.

2. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a rotating wheel provided with a series of molds in its periphery, means for injecting molten metal into the molds, means to move the molds successively into casting position, and means to feed the hardened portion of a projectile to each mold before it reaches its casting position.

3. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a series of molds each provided with a plunger which forms a part of the mold, means for injecting molten metal into the molds, means to move the molds successively into casting position, means to feed the hardened portion of a projectile to each mold before it reaches its casting position, and means to move the plungers to eject the cast projectiles.



4. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a rotating wheel provided with a series of molds in its periphery, each mold being provided with a plunger which forms a part of the mold, means for injecting molten metal into the molds, means to move the molds successively into casting position, means to feed the hardened portion of a projectile to each mold before it reaches its casting position, and means to move the plungers to eject the cast projectiles.

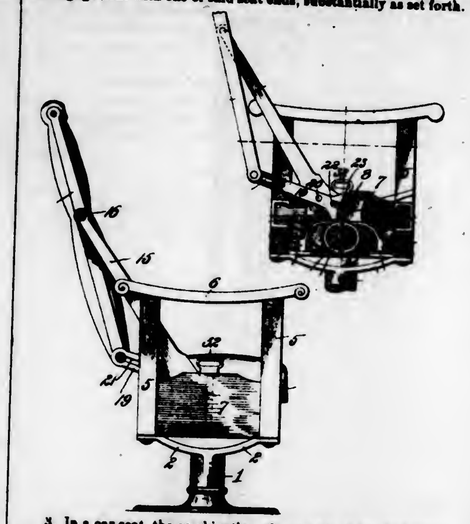
5. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a series of movable molds each adapted to form a projectile, of means to inject molten metal into the molds, means to move the molds successively into casting position, a magazine adapted to contain the hardened portions of the projectiles, the magazine being so located that the molds are brought successively thereunder during their movement to the casting position and an opening in the top of each mold whereby as the molds are brought under the magazine a hardened portion will be delivered into each mold.

6. In an apparatus for casting projectiles which are provided with a hardened portion, the combination with a rotating wheel provided with a series of molds in its periphery, means for injecting molten metal into the molds, means to move the molds successively into casting position, a magazine adapted to contain the hardened portions of the projectiles, the magazine being so located that the molds are brought successively thereunder during their movement to the casting position and an opening in the top of each mold whereby as the molds are brought under the magazine a hardened portion will be delivered into each mold.

810,833. REVERSIBLE CAR-SEAT. HUBERT WITTE, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed July 7, 1905. Serial No. 268,649.

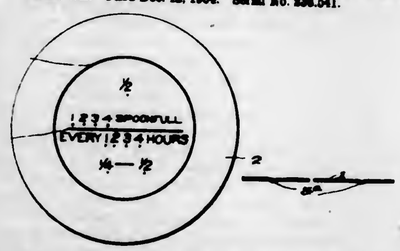
Claim.—1. In a car-seat, the combination of seat ends, back-supporting arms swingingly supported by said seat ends, a rock-shaft, links fixed to said rock-shaft, dog-carrying bars pivoted to said links, said bars being provided with dogs arranged to be engaged by said supporting-arms and to be moved out of engagement with said arms, and means for rotating said rock-shaft, substantially as set forth.

2. In a car-seat, the combination of seat ends, back-supporting arms swingingly supported by said seat ends, a rock-shaft, dogs swingingly supported by said rock-shaft, and arranged to be engaged by said back-supporting arms, a hand-lever fixed to said rock-shaft, and a rocking handle carried by said hand-lever and arranged for engagement with one of said seat ends, substantially as set forth.



3. In a car-seat, the combination of seat ends, back-supporting arms swingingly supported by said seat ends, a rock-shaft, dogs swingingly supported by said rock-shaft, and arranged to be engaged by said back-supporting arms, a hand-lever fixed to said rock-shaft, and a rocking handle carried by said hand-lever and arranged for engagement with one of said seat ends; said handle being provided with tongues and said seat end being provided with a pocket to receive said tongues, substantially as set forth.

810,834. COVER FOR JARS, GLASSES, &c. ARTHUR W. ZIEGLER, Berlin, Wis. Filed Dec. 12, 1904. Serial No. 236,541.



Claim.—1. A cover-plate for jars, glasses, &c., of soft material having its peripheral portion adapted to be molded over the top of the receptacle and to keep its shape when so molded, said plate having means to center the same on the top of a receptacle.

2. A cover-plate for jars, glasses, &c., of soft material having its peripheral portion adapted to be molded over the top of the receptacle and to keep its shape when so molded, said plate having a circular embossed line inscribed thereon equidistant from its center, whereby it may be centered on the top of the receptacle.

810,835. APPARATUS FOR HEATING PROPAGATING-BEDS. HENRY ASHTON, Felton, Del. Filed Jan. 31, 1905. Serial No. 243,514.

Claim.—1. An apparatus of the class described, comprising a furnace or heater adapted to be located beneath the surface of the ground and provided at the top with a fuel-inlet, an air-inlet located at one end of the furnace or heater, and a heat-conduit extending from the other end of the furnace or heater, said heat-conduit being arranged to extend beneath a hot-bed.

2. An apparatus of the class described, comprising a furnace or heater adapted to be located beneath the surface of the ground, a

heat-conduit extending longitudinally from one end of the furnace or heater and arranged to extend beneath a hot-bed and provided at its outer portion with an outlet, and an upwardly-extending air-inlet located at the other end of the furnace or heater.

3. An apparatus of the class described, comprising a furnace or heater provided at the top with a fuel-inlet and adapted to be located beneath the surface of the ground, a heat-conduit extending longitudinally from one end of the furnace or heater and arranged to extend beneath a hot-bed and provided at its outer portion with an outlet, and an upwardly-extending air-inlet located at the other end of the heater or furnace and being of a diameter less than the heat-conduit.

4. An apparatus of the class described, comprising a substantially horizontal furnace or heater provided at the top with a fuel-inlet and adapted to be located beneath the surface of the ground, a heat-conduit extending longitudinally from one end of the furnace or heater, an upwardly-projecting air-inlet extending from the other end of the furnace or heater, and an escape-pipe connected with and extending upward from the outer end of the heat-conduit.

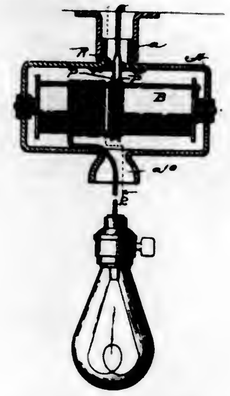
5. An apparatus of the class described, comprising a furnace or heater provided at the top with a fuel-inlet and adapted to be located beneath the surface of the ground and provided with an air-inlet, a heat-conduit extending from one end of the furnace or heater and arranged to extend beneath a hot-bed, said heat-conduit being arranged at an inclination and extended upwardly and outwardly, whereby the distance between it and a hot-bed decreases as the distance from the furnace increases, and an outlet located at the outer end of the heat-conduit.

6. An apparatus of the class described, comprising a furnace or heater, a heat-conduit adapted to be located beneath a hot-bed and extending upward and outward at an inclination so as to approach the hot-bed as it recedes from the furnace or heater and provided with an imperforate inner portion and having openings at its outer portion, an air-inlet connected with the furnace or heater, and an escape-pipe extending from the outer end of the heat-conduit.

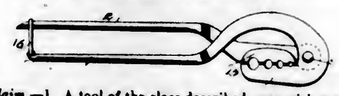
7. An apparatus of the class described, comprising a furnace or heater adapted to be located beneath the surface of the ground and provided at the top with a vertical fuel-inlet having an exterior cover, an air-inlet pipe connected with the outer end of the furnace or heater and extending to a point above the ground and provided with means for controlling the draft, a longitudinal heat-conduit connected with the other end of the furnace or heater and arranged to extend beneath a hot-bed, and an outlet at the outer portion of the heat-conduit.

810,886. ELECTRIC-LIGHT FIXTURE. JOHN F. BARRETT and HAT C. COLLINS, Chicago, Ill. Filed June 3, 1905. Serial No. 263,670.

Claim.—The combination with a lamp, of a socket, a drum, a frame for holding said drum adapted to be removably secured to said socket, an electrical cable adapted to be wound upon said drum and means for permitting said cable to unwind and an electrical connection between said lamp and socket.



810,887. WIRE-WORKING TOOL. THOMAS J. BAUGH, Hopkinsville, Ky. Filed Mar. 3, 1905. Serial No. 248,201.



Claim.—1. A tool of the class described, comprising a member having its forward portion returned upon itself and a second member pivoted to the first-named member, said second member having a portion thereof coöperating with the returned portion of the first-named member to produce a pair of laterally-disposed rearwardly-opening clamping-jaws.

2. A tool of the class described, comprising a pair of crossed pivoted members having coöperating rearwardly-opening clamping-jaws disposed at one side of the tool, one of said jaws being produced by returning the forward portion of one of the members upon itself, said returned portion being of increased thickness comparative with the remainder of the member, and the other member having its clamping portion provided with a lateral extension of a thickness corresponding to the increased thickness of the first-named jaw.

3. In a tool of the class described, a pair of crossed pivoted members, one of said members having a rearwardly-extending portion constituting a clamping-jaw and provided with a laterally-opening circular socket, the other of said members being provided with a circular head pivotally seated in said socket and with a clamping portion adapted to aline and coöperate with the clamping portion of the first-named member.

810,888. BOILER COMPOUND. PETER B. BIRD, New York, N. Y. Filed July 3, 1905. Serial No. 268,187.

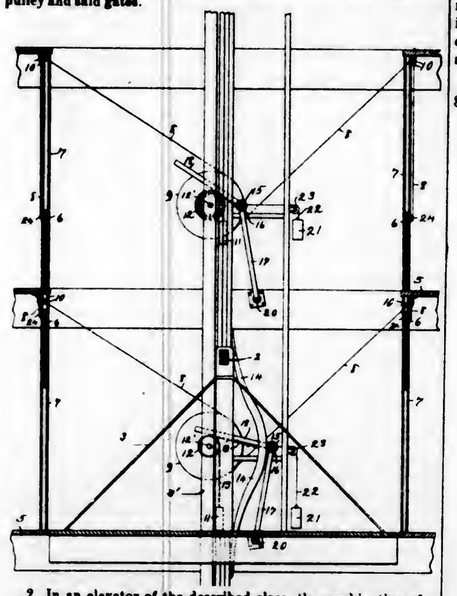
Claim.—1. The herein-described compound for preventing incrustation in boilers, comprising vegetable acid, alkaline salt, carbohydrate as herein specified, mercury, and oil in about the proportions described.

2. The process of forming a paste boiler compound, consisting in boiling together proportions of vegetable astringent and alkali, dissolving therein by boiling, a proportion of carbohydrate as herein specified, and adding thereto, when at a suitable temperature, a solution of mercury in animal oil, whereby a paste of permanent character is formed.

3. The process of forming a boiler compound, consisting in making a solution of one or more substances, such as alkali, vegetable acid, and carbohydrate as herein specified, and adding thereto to form a permanent paste, a solution of mercury and oil, substantially as described.

810,889. AUTOMATIC ELEVATOR-GATE. PHILIP F. BLIM, Chicago, Ill. Filed June 5, 1905. Serial No. 263,766.

Claim.—1. In an elevator of the described class, the combination of a two-way cam carried by the platform; a cam-actuated bearing located at each of the several landings of the elevator-shaft; a revoluble drum; a flexible connection connected at one end with said cam-actuated bearing and having its other end secured at a fixed point to said drum and adapted to be wound upon and unwound from said drum; a revoluble pulley connected to and adapted to revolve with said drum; one or more vertically-moving gates slidably supported in suitable guideways at each of the several landings of the elevator-shaft and flexible connections communicating between said pulley and said gates.



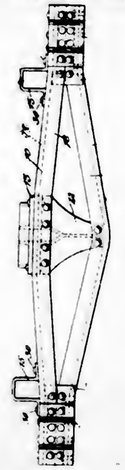
2. In an elevator of the described class, the combination of a two-way cam carried by the platform; a cam-actuated bearing located at each of the several landings of the elevator-shaft; a revoluble drum; a strap connected at one end with said cam-actuated bearing and having its other end secured at a fixed point to said drum and adapted to be wound upon and unwound from said drum; a revoluble pulley connected to and adapted to revolve with said drum; one or more vertically-moving gates slidably supported in suitable guideways at each of the several landings of the elevator; flexible connections communicating between said pulley and said gates; weights and straps connected with said drum, beneath said first-named straps at each of the respective landings of the elevator-shaft, said weights being adapted to counterbalance a portion of the weight of the gates connected therewith at each of the respective landings, substantially as set forth.

3. In an elevator of the described class, the combination of a two-way cam carried by the platform; a cam-actuated roller; a roller-supporting shaft; a shaft-supporting vibratory arm located at each of the respective landings of the elevator-shaft; a drum; a pulley and a supporting-shaft revolubly supported in suitable bearings at each of the respective landings of the elevator; a strap connected at one end with said drum and at its other end with the shaft of said roller-bearing; one or more gates slidably supported in suitable bearings at each of the respective landings; a flexible connection communicating between said pulley and said gates; a counterweight, a strap for suspending said counterweight, connected at one end to said weight, and at the other end, to said drum beneath said first-named strap, substantially as set forth.

4. In an elevator of the described class, the combination of a two-way cam carried by the platform; a cam-actuated roller; a roller-supporting shaft; a shaft-supporting vibratory arm located at each of the respective landings of the elevator-shaft; a drum; a pulley and a supporting-shaft revolubly supported in suitable bearings at each of the respective landings of the elevator; a strap connected at one end with said drum and at its other end with the shaft of said roller-bearing; one or more gates slidably supported in suitable bearings at each of the respective landings; a flexible connection communicating between said pulley and said gates; a counterweight also suitably suspended by flexible bearings from said drum and adapted to partially counterbalance the weight of said gates, and an additional counterweight suspended by a flexible connection from the shaft of said roller-bearing upon the opposite end from that of the bearing, said flexible connection being centrally supported upon a pulley, whereby as said roller-bearing is actuated by said cam said weight will coöperate therewith to laterally move the same, substantially as set forth.

5. In an elevator of the class described, the means for temporarily connecting the gate-actuating rope with the gate, consisting in the combination with the rope and gate, of a wooden block and one or more block-retaining screws, substantially as and for the purpose specified.

810,840. CAR-BOLSTER. ARGYLE CAMPBELL, Chicago, Ill., assignor to The Enterprise Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 18, 1905. Serial No. 279,033.



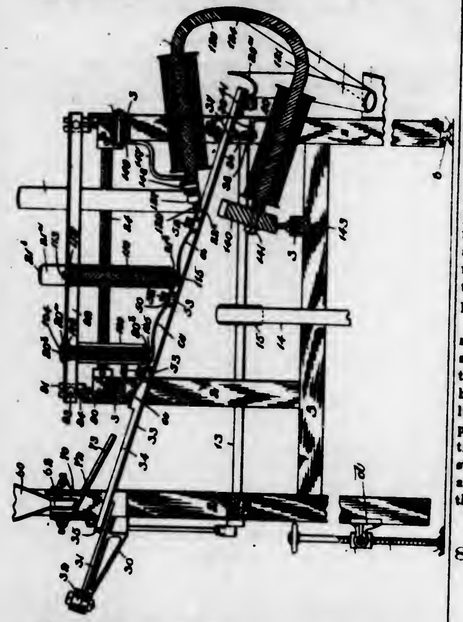
Claim.—1. In a bolster, the combination of an upper member extending from end to end of the bolster, downwardly-turned flanges at the ends of the said member, a lower member extending from end to end of the bolster, upwardly-turned flanges at the ends of said member, one of said members being broader than the other, and neither cross member or its flanges substantially overlapping parts of the other member, a suitable brace or support at the center of the bolster between said upper and lower members, and a set of plates inserted inside the end flanges of the larger member and outside of the end flanges of the narrower member at the ends of the bolster and separate means for securing said plates to the flanges of the upper and lower members.

2. In a bolster, the combination of an upper member extending from end to end of the bolster, downwardly-turned flanges at the ends of the said member, a lower member extending from end to end of the bolster, upwardly-turned flanges at the ends of said member, one of said members being broader than the other, and neither cross member or its flanges substantially overlapping parts of the other member, a suitable brace or support at the center of the bolster between said upper and lower members, and a set of plates inserted inside the end flanges of the broader member and outside the end flanges of a narrower member at the ends of the bolster, separate means for securing said plates to the flanges of the upper and lower members, and reinforcing means between the flanges secured to both the upper and lower members.

3. In a bolster, the combination of an upper member extending from end to end of the bolster, downwardly-turned flanges at the ends of the said member, a lower member extending from end to end of the bolster, upwardly-turned flanges at the ends of said member, one of said members being broader than the other neither member or its flanges overlapping parts of the other member, a suitable brace or support at the center of the bolster between said upper and lower members, a set of plates inserted inside the end flanges of the larger member and outside of the end flanges of the narrower member said plates being of such a thickness that they and the narrower members

together occupy a horizontal space substantially equal to the width of the broader member, vertical reinforcing members adjacent to the sides of the ends of the bolster thus far described and independent separate mechanisms for securing the flanges of each cross member to the adjacent plate and reinforcing member.

810,841. MAGNETIC SEPARATOR. HENRY F. CAMPBELL, Melrose, Mass., assignor to National Magnetic Mineral Separating Company, Boston, Mass., a Corporation of Maine. Filed July 20, 1903. Serial No. 117,894.



Claim.—1. The combination in a magnetic separator, of a magnet; a tray, presenting an unobstructed surface at a due distance below the magnet, for supporting and conveying the material spread in a film of substantially uniform thickness under and past the magnet, and through an uninterrupted field of such magnet, a cover for said tray for preventing the passage of magnetic particles to the sides of the magnet, and means for imparting a transverse shaking movement to the said support.

2. In a magnetic ore-separator, a magnetic separating device arranged to remove magnetic particles from a mass of ore, a tray or conveyer arranged to conduct the ore to the field of said device, magnets furnished with spools so wound that the current may be changed from series to parallel, means for making such change, and means for carrying aside the particles removed.

3. The combination in a magnetic separator, of a magnet; means, presenting an unobstructed surface at a due distance below the magnet, for supporting and conveying the material under and past the magnet, and through an uninterrupted field of such magnet, and to pass it, spread in a film of substantially uniform thickness on the surface beneath the magnet, a vibrating shaker for delivering the material to the said conveying means, said shaker having a boss, a hopper arranged over said shaker and having a pipe the delivering end of which terminates over and close to the top of said boss, and means for causing the particles of ore to be mechanically agitated under the magnet in a direction other than that of the travel of the ore.

810,842. ARTIFICIAL DENTURE. JOHN M. CARR, Olean, N. Y. Filed May 19, 1905. Serial No. 261,221.

Claim.—1. A process of making dental plates consisting in forming a model and fastening the same to an articulator, then coating the model with liquid silex, next conforming the body portion of the plate to the model while on the articulator, then articulating the teeth on the body portion of the plate and applying a gum-colored rubber strip upon the labial surface while the plate is still on the articulator.

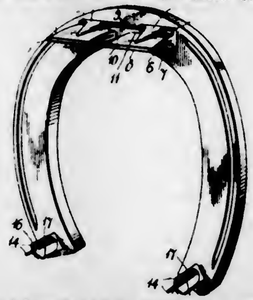
2. A process of forming dental plates consisting in forming a model and coating the same with liquid silex, then applying a solution of rubber and chloroform, next conforming the plate-body to the model, articulating the teeth on the plate-body, and finally applying a gum-colored strip upon the labial surface, all of said several steps being completed while the model is on the articulator.

3. A process of making dental plates which consists in forming a model and fastening it to the articulator, then conforming the plate-body to the model, next articulating the teeth on the plate-body, then applying a gum-colored labial strip on the labial side of the model, while still on the articulator, then removing the model with the completed plate from the articulator, and finally vulcanizing and polishing the plate.

4. A process of making dental plates which consists in forming a model and fastening the same on the articulator, then conforming plastic vulcanizable rubber sheet to the model to form the main base, next setting up the individual teeth in a plastic holding-boss, then applying a sheet of dental rubber upon the lingual surface of the main base while the model is still on the articulator, then removing the model and plate from the articulator, and finally vulcanizing and polishing the plate.

5. A process of making dental plates which consists in forming a model and fastening the same to the articulator, conforming a sheet of plastic vulcanizable or waxable rubber to the model to form the main base of the plate, then setting up each tooth in a plastic holding-boss on the main base, applying a sheet of dental rubber as a lingual lining upon the main base, working interstitial pieces of pink rubber into the interstices between the teeth at the labial side thereof, then applying a strip of pink rubber over the entire labial surface of the main base while the model and plate are still on the articulator, then removing the model with its completed plate from the articulator, and finally vulcanizing and polishing the plate.

810,843. HORSESHOE-CALK. WILLIAM B. COLE and FRANK H. THORNLEY, Rhinebeck, N. Y. Filed Apr. 10, 1905. Serial No. 254,825.



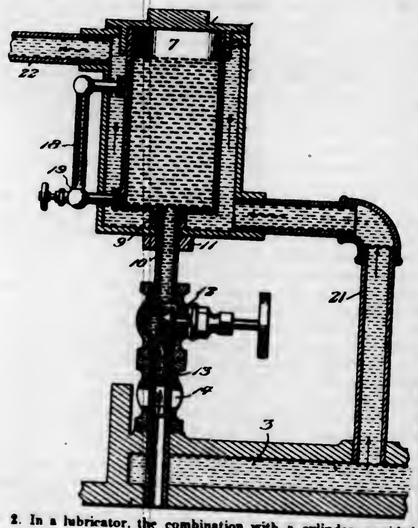
Claim.—1. A horseshoe having detachable toe-calks, in combination with a coupling device having recesses in its ends to engage the opposing ends of the toe-calks and prevent the latter from turning, substantially as described.

2. A toe-calk comprising a body having substantially parallel sides, outwardly-extending base-flanges, strengthening-webs in the angles between the sides and base-flanges, a recess between the sides, and a blade in said recess, substantially as described.

3. A horseshoe having toe-calks provided with base-flanges, in combination with a coupling device bearing on the base-flanges of the calks and having recesses in its ends to receive the opposing end portions of the calks, said coupling device preventing the calks from turning, substantially as described.

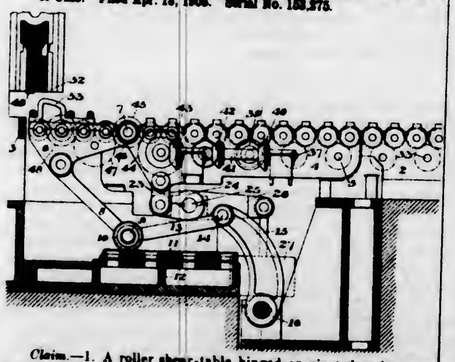
810,844. LUBRICATOR. LUNDY O. CRAWFORD, Pendleton, Ind., assignor of one-half to John F. Wagner, Anderson, Ind. Filed Dec. 13, 1904. Serial No. 236,603.

Claim.—1. In a lubricator, the combination with an engine-cylinder provided with a water-jacket, of a casing provided with inlet and outlet openings, a reservoir disposed within said casing and having an annular member to space the reservoir away from the bottom of the casing, a feed-tube connected with the annular member to secure the reservoir in applied position and convey the lubricant to the engine-cylinder, and a pipe having one end mounted within said inlet-opening and the other end connected to the water-jacket, whereby the heated water will pass into the casing to retain the lubricant in proper condition.



2. In a lubricator, the combination with a cylinder provided with a water-jacket, of a casing provided with inlet and outlet openings, a reservoir positioned within said casing and having an annular member to space the reservoir away from the bottom of the casing, a closure adapted to be removably secured to the reservoir to close the casing and reservoir, a gage secured to the reservoir, a feed-tube connected with the annular member to retain the reservoir in applied position and convey the lubricant to the cylinder, and a pipe having one end mounted within the inlet-opening of the casing and its other end secured to the water-jacket so as to convey the heated water to the casing to retain the lubricant in proper condition.

810,845. SHEAR-TABLE. JOHN C. CROMWELL, Cleveland, Ohio, assignor to The Garrett-Cromwell Engineering Company, a Corporation of Ohio. Filed Apr. 18, 1903. Serial No. 153,275.



Claim.—1. A roller shear-table hinged or pivoted at its outer end to tilt as a whole under the action of the shear-blade, its inner end portion being formed by a separately-tiltable section; substantially as described.

2. A roller shear-table hinged or pivoted at its outer end to tilt as a whole under the action of the shear-blade, and having its inner end portion formed by a separately-tiltable portion, means for raising and lowering the separately-tiltable portion, and means for swinging the table as a whole upwardly to its normal position after it has been tilted by the shear-blade; substantially as described.

3. A roller shear-table pivoted or hinged to tilt as a whole and having at its inner end portion a separately-tiltable portion pivoted thereto, and actuating connections for swinging the separately-tiltable portion to discharge scrap; substantially as described.

4. A tilting shear-table having a tilting section pivoted thereto and extending to the shear, a shear-blade arranged to depress the table during shearing automatic mechanism for returning the table to its normal position, and mechanism for swinging the tilting section to discharge the scrap; substantially as described.

5. A tilting shear-table having at least a portion thereof pivoted to the table proper and arranged to swing downwardly, a shear-blade arranged to depress the table during shearing automatic mechanism for exerting a lifting pressure on the swinging portion, and mechanism for positively swinging this portion to discharge the scrap; substantially as described.

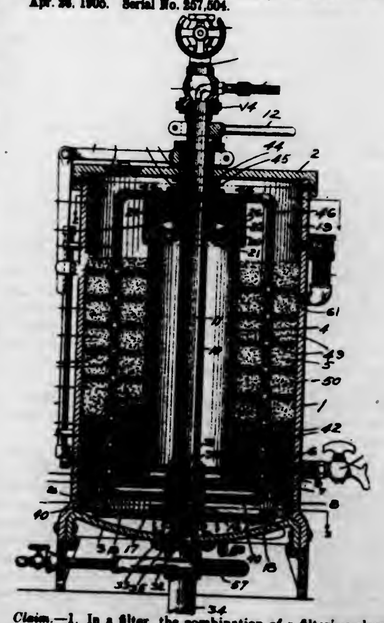
6. A tilting shear-table having a swinging table-section pivoted thereto, a shearing-blade arranged to depress the table during shearing automatic counterbalance mechanism arranged to return the parts to their normal position, and mechanism for positively swinging the tilting section to discharge the scrap; substantially as described.

7. A tilting shear-table having a swinging section pivoted thereto, a shearing-blade arranged to depress the table during shearing positively-driven feed mechanism on the table and swinging section, automatic counterbalance mechanism for returning the parts to their normal position, and mechanism for swinging the tilting sections to discharge the scrap; substantially as described.

8. A tilting shear-table having an extension pivoted thereto, a shearing-blade arranged to depress the table during shearing counterbalance mechanism for the table and the tilting section, and power-driven feed mechanism on both the table and swinging section; substantially as described.

9. The combination with a tilting shear-table having yokes or brackets at its front end, of a shear-blade plunger having projections at each side to engage the yokes or brackets; substantially as described.

810,846. FILTER. JOHN T. CUNNINGHAM, Allegheny, Pa. Filed Apr. 26, 1905. Serial No. 257,504.



Claim.—1. In a filter, the combination of a filtering-chamber, valve mechanism therefor comprising an outer tube or cylinder provided with a plurality of openings, one being the filtering-water in-

let, another being the washing-water inlet, an interior tubular valve having a supply-inlet thereto and having openings coöperating with those of the outer tube or cylinder, and arranged to connect the supply-inlet to the filtering-inlet and also to the washing-inlet, a filtered-fluid valve operatively connected to said inner tube, said outer and inner tubes being capable of relative rotary movement and the openings therein being so arranged that when the filtering inlet and outlet are open the washing-inlet is closed, and vice versa, and a valve-controlled washing-outlet from said filtering-chamber.

2. In a filter, the combination of a filtering-chamber, valve mechanism therefor comprising an outer tube or cylinder provided with a plurality of openings, one being the filtering-water inlet, another being the washing-water inlet, and a third being the washing-water outlet, an interior tubular valve having a water-supply connection thereto and having openings coöperating with those of the exterior tube, and arranged to connect the supply-inlet to the filtering inlet and also to the washing-inlet, and a filtered-fluid valve operatively connected to said interior tube, said outer and inner tubes being arranged for relative rotary movement and the openings therein and valve thereon being so arranged that when the filtering inlet and outlet are open the washing inlet and outlet are closed, and vice versa.

3. In a filter, the combination of a pure-water reservoir and a filtering-chamber arranged concentrically, a central tube provided with openings communicating with the filtering side of the filtering-chamber and with other openings communicating with the washing side of said filtering-chamber, openings establishing communication between the filtered-liquid reservoir and the filtering-chamber, and an inner tube having connection with the water-supply and provided with openings coöperating with those in the outer tube and arranged to connect the water-supply to the filtering-opening and also to the washing-opening, said inner tube also carrying a valve controlling the communication from the filtering-chamber to the filtered-liquid reservoir, said tubes being capable of relative rotary movement and the arrangement being such that when the filtering inlets and outlets are open the washing-inlet is closed, and vice versa.

4. In a filter, the combination of a filtered-liquid reservoir and a filtering-chamber arranged concentrically, a central tube provided with openings communicating with the filtering side of the filtering-chamber, other openings communicating with the washing side of the filtering-chamber, and other openings leading to a washing-outlet, openings establishing communication between the filtered-liquid reservoir and the filtering-chamber, and an interior tube having connection with the water-supply and provided with openings coöperating with the three series of openings in the outer tube and carrying the valve controlling the communication between the filtering-chamber and the filtered-liquid reservoir, said inner and outer tubes being capable of relative movement and the arrangement being such that when the filtering inlets and outlet are open the washing inlet and outlet are closed, and vice versa.

5. In a filter, the combination of an exterior casing, a perforated bottom located above the lower end of said casing, a reservoir located centrally in said casing and provided with openings in its top, filtering material on said perforated bottom in the annular space surrounding the central reservoir, a pipe projecting centrally through said chamber and provided near its lower end with openings communicating with the inlet-chamber, and with other openings communicating with the outlet-pipe, a pipe arranged inside of said central pipe and rotatable with reference thereto, said central pipe being provided at its lower end with openings adapted to register with the washing-outlet of the outer pipe and with other openings adapted to register with the openings communicating with an inlet-chamber, and having a diaphragm between said two sets of openings, a valve carried by said inner pipe and controlling the openings in the upper end of the central reservoir, and a water-supply connection to said inner pipe.

6. In a filter, the combination of a filtering-chamber, granular filtering material therein, perforated washing-pipes extending into said granular material, a supply-inlet to said chamber, a filtered-fluid outlet therefrom, a washing-outlet therefrom, an inlet from the supply to the washing-pipes, valves controlling said inlets, outlets and washing-pipes, said valves being so arranged that when the supply-inlet and filtered-fluid outlet are open the inlet to the washing-pipes and the washing-outlet are closed, and vice versa, and connected operating-means for said several valves whereby they are operated in unison.

7. In a filter, the combination of a filtering-chamber, granular filtering material therein, perforated washing-pipes extending into said granular material, means for moving said pipes in said material, a supply-inlet to said chamber, a filtered-fluid outlet therefrom, a washing-outlet therefrom, an inlet from the supply to the washing-pipes, valves controlling said inlets, outlets and washing-pipes, said valves being so arranged that when the supply-inlet and filtered-fluid outlet are open the inlet to the washing-pipes and the washing-outlet are closed, and vice versa, and connected operating-means for said several valves whereby they are operated in unison.

8. In a filter, the combination of a filtering-chamber circular in cross-section, granular filtering material therein, perforated washing-pipes extending down into said granular material and rotatably mounted concentrically in said chamber, means for rotating said pipes, a supply-inlet to said chamber, a filtered-fluid outlet therefrom, a washing-outlet therefrom, an inlet from the supply to the washing-pipes, valves controlling said inlets, outlets and washing-pipes, said valves being so arranged that when the supply-inlet and filtered-fluid outlet are open the inlet to the washing-pipes and the washing-outlet are closed, and vice versa, and connected operating means for said several valves whereby they are operated in unison.

9. In a filter, the combination of a filtering-chamber, granular filtering material therein, a water-inlet pipe through the head of said chamber, pipes connected to said inlet-pipe and extending radially and thence downwardly into the granular material and being perforated, means for rotating said pipes around the inlet-pipe, and valve mechanism for the inlet-pipe arranged to direct the water either into the filtering-chamber or into the perforated pipes.

10. In a filter, the combination of a filtering-chamber, a water-supply connection thereto, granular filtering material in said chamber, perforated washing-pipes extending downwardly into said material, means for moving said pipes through said material, stationary perforated washing-pipes extending upwardly in the granular material, and valve mechanism for the water-supply connection arranged to direct the water either into the filtering-chamber or into the washing-pipes.

11. In a filter, the combination of a filtering-chamber, granular filtering material therein, a water-inlet pipe, perforated washing-pipes connected to said inlet-pipes and extending upwardly in the lower portion of said granular material, movable perforated pipes also connected to said inlet-pipe and extending radially and thence downwardly into the granular material, means for rotating said last-named pipes, and valve mechanism for the inlet-pipe arranged to direct the water either into the filtering-chamber or into the perforated pipes.

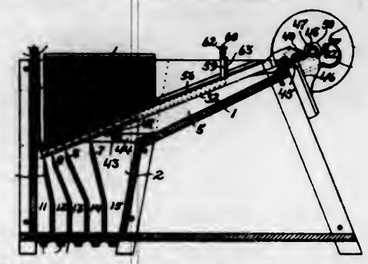
12. In a filter, the combination of a filtering-chamber and a filtered-water reservoir arranged concentrically, a central tube therefor, an inner tube in said central tube, a supply connection to said inner tube, said tubes being provided with openings adapted to register and being relatively rotary so as to change the course of water from the supply-inlet through the filter, and a steam or hot-water connection to said inner tube.

13. In a filter, the combination of a filtering-chamber, an inlet-chamber underneath said filtering-chamber, an outlet from the upper end of said chamber, a central inlet-pipe projecting into said inlet-chamber, and pipes connected to said inlet-pipe and projecting radially in said inlet-chamber and provided with bent ends whereby the water in said inlet-chamber will be given a continuous swirling movement.

14. In a filter, the combination of an exterior casing, a perforated bottom located above the lower end of said casing, a reservoir located centrally in said casing and provided with openings in its top, filtering material on said perforated bottom in the annular space surrounding the central reservoir, a pipe projecting centrally through said chamber and provided near its lower end with openings communicating with the inlet-chamber, and with other openings communicating with an outlet-pipe, and near its upper end with openings having connected thereto pipes projecting down into the filtering material, a pipe arranged inside of said central pipe and rotatable with reference thereto, said central pipe being provided at its lower end with openings adapted to register with the washing-outlet of the outer pipe and with other openings adapted to register with the openings communicating with the inlet-chamber and having a plug or diaphragm between said two sets of openings, said inner tube at its upper end having openings adapted to register with the openings in the outer tube to which the washing-pipes are connected, a valve carried by said inner pipe and controlling the openings in the upper end of the central reservoir, and a water-supply connected to said inner pipe.

810,847. ORE-CONCENTRATOR. EMIL DEBERTH, Fort Wayne, Ind. Filed Feb. 4, 1905. Serial No. 244,234.

Claim.—1. An ore-concentrator comprising a stationary tank adapted to hold a body of water; and a concentrating-pan having upturned sides at its upper portion and convergent edges at its discharge end, and having also riffles upon its concentrating-surface which converge toward its discharge end, the said pan being arranged in the tank with its concentrating-surface beneath the level of water contained therein, and being adapted to be reciprocated in line with the plane of its concentrating-surface.



2. An ore-concentrator comprising a stationary tank adapted to hold a body of water; and a concentrating-pan having upturned sides and with convergent edges at its discharge end, and having also a series of riffles which converge toward its discharge end, and a central longitudinal channel, the said pan being arranged in the tank with its concentrating-surface beneath the level of water contained therein and being adapted to be reciprocated in line with the plane of its concentrating-surface.

3. An ore-concentrator comprising a stationary tank adapted to hold a body of water; a concentrating-pan having convergent edges at its discharge end, arranged in the tank with its concentrating-surface beneath the level of water contained therein, and being adapted to be reciprocated in line with the plane of its concentrating-surface; and a series of divergent diverting-blades suspended over the pan and being adapted to direct overlying ore matter toward its edges.

4. An ore-concentrator comprising a stationary tank adapted to hold a body of water; a concentrating-pan the edges of which converge near the discharge end thereof, arranged in the tank with its concentrating-surface beneath the level of water contained therein and being adapted to be reciprocated in line with the plane of its concentrating-surface; a series of riffles on the pan which converge toward its discharge end; a series of receptacles transversely disposed in the lower part of the tank beneath the convergent edges of the pan; and stationary diverting-blades to direct overlying ore matter toward the edges of the pan.

5. An ore-concentrator comprising a stationary tank adapted to hold a body of water; a concentrating-pan, the edges of which converge at its discharge end, arranged in said tank with its concentrating-surface beneath the level of water contained therein, and being adapted to be reciprocated in line with the plane of its concentrating-surface; stationary diverting-blades above said pan, adapted to divert overlying ore matter toward the sides of said pan; receptacles in said tank beneath said pan, adapted to receive ore matter respectively from said convergent edges and discharge end of said pan; and mechanism to actuate said pan.

6. An ore-concentrator comprising a stationary tank having two compartments and adapted to hold a body of water; a number of receptacles in each of said compartments, the receptacles of one compartment communicating with the corresponding receptacles of the other compartment; a reciprocating concentrating-pan arranged in one of said compartments beneath the level of water contained therein, and with its discharge end extending over the receptacles of the corresponding compartment; and a series of diverting-blades in stationary relation with the tank and being adapted to direct overlying ore matter from said pan into said receptacles.

7. An ore-concentrator comprising a tank; a reciprocating concentrating-pan submerged in the tank and having a slight depression throughout its length; and a series of stationary diverting-blades arranged above the pan and which diverge toward the sides thereof.

8. An ore-concentrator comprising a tank; a reciprocating concentrating-pan submerged in the tank and having riffles which converge toward its discharge end; and a series of stationary diverting-blades arranged above the pan and which diverge toward the sides thereof.

9. An ore-concentrator comprising a tank having a series of receptacles in the lower part thereof; a reciprocating concentrating-pan arranged in said tank and having a pointed discharge end; and a series of divergent diverting-blades arranged over the pan and adapted to direct overlying ore matter from said pan into the foremost of said receptacles.

10. An ore-concentrator comprising a tank having a series of receptacles in the lower part thereof; a reciprocating concentrating-pan arranged in said tank with its discharge end over said receptacles; a series of divergent diverting-blades arranged above the pan and adapted to direct overlying ore matter from said pan into the foremost of said receptacles; and periodically-actuated outlet-valves located respectively in said receptacles.

11. An ore-concentrator comprising a tank; a reciprocating concentrating-pan in said tank; a series of diverting-blades arranged over the pan and adapted to direct overlying ore matter toward the sides thereof; and a diffusion-box extending within the tank and located over the diverting-blades for supplying the tank with water.

12. An ore-concentrator comprising a tank adapted to hold a body of water and having a series of receptacles in the lower part thereof; discharge-spouts leading respectively from said receptacles; a reciprocating concentrating-pan arranged in said tank with its discharge end over said receptacles, and having a series of riffles which converge toward its discharge end; a series of diverting-blades arranged over said pan, which diverge toward the sides thereof and are adapted to direct overlying ore matter therefrom into the foremost of said receptacles; and a diffusion-box extending within the tank and located over said diverting-blades for supplying said tank with water.

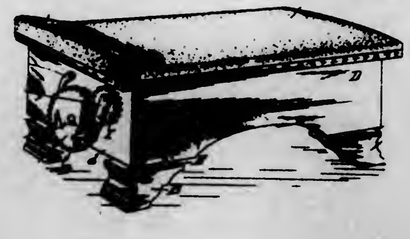
13. An ore-concentrator comprising a tank adapted to hold a body of water and having a series of receptacles in the lower part thereof; discharge-spouts, having valves in connection therewith, leading from said receptacles respectively; a reciprocating concentrating-pan arranged in said tank with its discharge end over said receptacles, and having riffles which converge toward its discharge end; and a series of diverting-blades adapted to direct overlying ore matter from said pan into the foremost of said receptacles.

14. In an ore-concentrator, a tank having a series of receptacles in its lower part, each of said receptacles having a discharge-spout; a concentrating-pan in said tank, adapted to discharge ore matter into said receptacles; a series of valves for the respective spouts or said receptacles; a corresponding series of levers in actuating relation with said valves; cams to actuate said levers; and an adjustable support for said levers to shift them into or out of engaging position relative to said cams.

15. An ore-concentrator comprising a tank having a series of receptacles in the lower part thereof; a reciprocating concentrating-pan arranged in the tank with its discharge end over said receptacles, and having a series of riffles which converge toward its discharge end; a series of divergent diverting-blades arranged above the pan and adapted to direct overlying ore matter from the pan into the foremost of said receptacles; and periodically-actuated outlet-valves located respectively in said receptacles.

16. An ore-concentrator comprising a tank adapted to hold a body of water and having a series of receptacles in the lower part thereof; discharge-spouts leading respectively from said receptacles; a corresponding series of automatically-actuated valves for said spouts; a reciprocating concentrating-pan arranged in the tank with its discharge end over said receptacles, and having a series of riffles which converge toward its discharge end; and a series of diverting-blades arranged over the pan, which diverge toward the sides thereof and are adapted to direct overlying ore matter therefrom into the foremost of said receptacles.

810,848. SURGICAL TABLE. EMMA B. DILL and SOLOMON F. DU BOIS, Chillicothe, Ohio. Filed Sept. 2, 1904. Serial No. 223,186.



Claim.—1. An operating-table, comprising a base having vertically-arranged slots in its ends, a table-frame telescoping the base, a shaft mounted in the ends of said frame and passing through said slots, cables connected to the shaft and to the base above the slots, and guides carried by the table-frame and extending down within the base, and around the shaft.

2. An operating-table, comprising a base having vertically-arranged slots in its ends, a table-frame telescoping the base, a shaft rotatably mounted in the table-frame and passing through the slots in the base, means carried by the outside of said frame for rotating the shaft, cables connecting the shaft and the base above the slots, and U-shaped guides carried by the frame and passing down within the base and around the shaft.

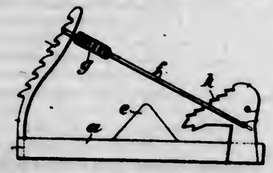
3. An operating-table, comprising a base, formed of a box-like form mounted upon feet, said feet extending beyond the same, to form supporting-ledges, vertically-arranged slots in the ends of the base and extending from the lower edge thereof adjacent the top, a table-frame composed of a box-like form telescoping the base and adapted to rest upon the ledges formed by the feet, a table carried by the upper end of said frame, a shaft rotatably mounted in the ends of said frame and passing through the slots in the base, a gear carried by the shaft on the outside of said frame, a pawl for holding said gear, means for rotating said gear, cables connecting said shaft and the base above the slots, and downwardly-extending U-shaped guides carried by the under side of the table and fitting within the base.

4. An operating-table, comprising a base having vertically-arranged slots in its ends, a table-frame telescoping the base, a shaft mounted in the ends of said frame and passing through said slots, cables connected to the shaft and to the base above the slots, and guides carried by the tables within the base

5. An operating-table comprising a base, a table-frame telescoping the base, a shaft mounted in the frame, cables carried by the shaft and secured to the base above the shaft, and guides carried by the table-frame and extending within the base and extending around the shaft.

6. An operating-table, comprising a base, formed of a box-like form mounted upon feet, said feet extending beyond the same to form supporting-ledges, vertically-arranged slots in the ends of the base and extending from the lower edge thereof adjacent the top, a table-frame composed of a box-like form telescoping the base and adapted to rest upon the ledges formed by the feet, a table carried by the upper end of said frame, a shaft having one end rotatably mounted inside of one end of said frame and the opposite end passing through the opposite end of the frame and within the slots in the base, a gear carried by the shaft on the outside of said frame, a pawl for holding said gear against rotation, a second smaller gear rotatably mounted on the side of the table-frame and meshing with the first gear, a crank for driving said second gear, cables connected to the shaft and having their upper ends connected to the base above the slots, and downwardly-extending U-shaped guides carried by the under side of the table and fitting within the base.

810,849. NAILLESS HORSESHOE. FRITZ BOSSE, Solothurn, Switzerland. Filed Sept. 30, 1905. Serial No. 280,939.

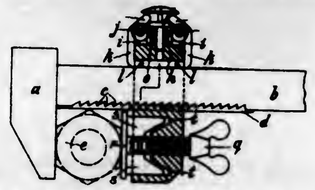


Claim.—1. In a rivetless and nailless horseshoe, the combination with the shoe of a ratched toe-clip, two toothed spring heel-clips and a fastening wire strap adapted to be hooked by its front portion in the ratched toe-clip and having in its sides spirally-wound parts intended to give rise to a spring action, so as to firmly and adjustably secure the shoe to the hoof, substantially as described.

2. In a rivetless and nailless horseshoe, the combination with the shoe of a ratched toe-clip entering a dovetailed tapered notch of the shoe, two toothed spring heel-clips secured to the latter by means of a similar dovetail connection and a fastening wire strap adapted to be hooked by its front portion in the ratched toe-clip and having in its sides spirally-wound parts intended to give rise to a spring action, so as to firmly and adjustably secure the shoe to the hoof, substantially as described.

3. In a rivetless and nailless horseshoe, the combination with the shoe of a ratched toe-clip entering a dovetailed tapered notch of the shoe, two toothed spring heel-clips secured to the latter by means of a similar dovetail connection and a fastening wire strap adapted to be hooked by its front portion in the ratched toe-clip and having in its sides spirally-wound parts intended to give rise to a spring action, so as to firmly and adjustably secure the shoe to the hoof, the said wire strap having its ends engaged with the aforesaid two heel-clips, substantially as described.

810,850. SCREW-WRENCH. VICTOR HERMAN, Muggia, near Trieste, Austria-Hungary. Filed Dec. 16, 1904. Serial No. 236,570.

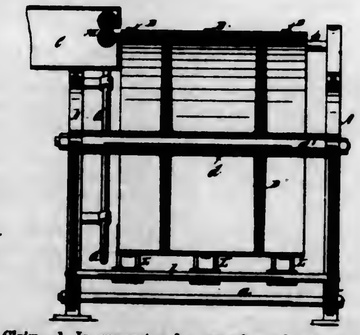


Claim.—1. In a screw-wrench of the character described, a stem carrying the fixed jaw and provided with teeth, a rib formed on the stem in the middle of said teeth, a movable jaw furnished with teeth and a groove which are adapted to engage with the teeth and rib on the stem, levers pivoted to the rear end of said movable jaw, spring-actuated means for forcing these levers into engagement with said stem, a groove formed in the movable jaw, a clamping-plate, and a rib on this plate fitted slidably in said groove.

2. In a screw-wrench of the character described, a stem carrying the fixed jaw and provided with teeth, a rib formed on the stem in the middle of said teeth, a movable jaw furnished with teeth and a groove which are adapted to engage with the teeth and rib on the stem, levers pivoted to the rear and of said movable jaw and having hook-shaped ends, spring-actuated means for forcing said hooked-shaped ends of the levers between said stem and movable jaw, a groove formed in the latter, a clamping-plate, and a rib on this plate fitted slidably in said groove.

3. In a screw-wrench of the character described, a stem carrying the fixed jaw and provided with teeth, a rib formed on the stem in the middle of said teeth, a movable jaw furnished with teeth and a groove which are adapted to engage with the teeth and rib on the stem, levers pivoted to the rear end of said movable jaw and having hook-shaped ends, a button engaging these levers, a spring acting upon the said button for forcing said hook-shaped ends of the levers between said stem and movable jaw, a groove formed in the latter, a clamping-plate, and a rib on this plate fitted slidably in said groove.

810,851. APPARATUS FOR REMOVING SUPERFLUOUS METALLIC COATING FROM SHEET METAL. OLIN S. FELLOWS and ARCHIBALD R. HOPKINS, Middletown, N. Y. Filed Apr. 28, 1905. Serial No. 257,903.



Claim.—1. In apparatus for removing superfluous metallic coating from sheet metal, the combination of curved plate-feeding mechanism and means concentric thereto for melting and removing the excess of metallic coating from the plate.

2. In apparatus for removing superfluous metallic coating from sheet metal, the combination of convex plate-feeding mechanism and means concentric thereto for melting and removing the excess of metallic coating from the plate.

3. In apparatus for removing superfluous metallic coating from sheet metal, the combination of curved plate-feeding mechanism, flexible means for holding a sheet-metal plate thereto and means concentric to said curved feed mechanism for melting and removing the excess of metallic coating from the plate.

4. In apparatus for removing superfluous metallic coating from sheet metal, the combination of means for bending a plate thereof and means for melting and removing the excess of metallic coating from said plate while so bent.

5. In apparatus for removing superfluous metallic coating from sheet metal, the combination of means for bending a plate of coated sheet metal and means for heating the edge of said plate and removing the list therefrom while the plate is so bent, for the purpose described.

6. In apparatus for removing superfluous metallic coating from sheet metal, the combination of means for bending a plate of coated sheet metal, means for heating said bent metal plate to melt the excess of metallic coating thereon, and means for removing the liquated excess of metallic coating from the plate while the latter is so bent, for the purpose described.

7. In apparatus for removing superfluous metallic coating from sheet metal, the combination of curved plate-feeding mechanism, means concentric thereto for heating an edge of the plate to melt the list or excess of metallic coating thereon, and means, also concentric to the feed mechanism, for removing the liquated excess of metallic coating from the heated edge of the plate for the purpose set forth.

8. In apparatus for removing superfluous metallic coating from sheet metal, the combination of curved plate-feeding mechanism, flexible means for holding a sheet-metal plate thereon, means concentric to said feed mechanism for heating the edge of the plate to melt the list or excess of metallic coating thereon, and means, also concentric to the feed mechanism, for removing the liquated excess of metallic coating from the heated edge of the plate for the purpose set forth.

9. In apparatus for removing superfluous metallic coating from sheet metal, a curved plate-holder of uniform radius, means concentric to said curved plate-holder adapted to heat an edge of a plate held on said holder and remove the list therefrom, and means for moving said holder to subject the edge of the plate to the action of the list heating and removing means, for the purpose described.

10. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, means for holding a coated sheet-metal plate upon and against the periphery of said drum, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of the plate so held on said rotatable drum, for the purpose described.

11. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, flexible means for holding a coated sheet-metal plate upon and against the periphery of said drum, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

12. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum and an endless belt traveling with said drum and arranged to hold a coated sheet-metal plate against the periphery of said drum, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

13. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, a plurality of endless belts traveling with said drum and arranged to hold a coated sheet-metal plate against the periphery of said drum, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

14. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, an endless belt traveling with said drum and arranged to hold a coated sheet-metal plate against the periphery thereof, means for automatically maintaining the tension of said belt, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

15. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, a plurality of endless belts traveling with said drum and arranged to hold a coated sheet-metal plate against the periphery thereof, means for automatically maintaining the tension of said belts, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

16. In apparatus for removing superfluous metallic coating from sheet metal, a curved holder of uniform radius, means for automatically receiving and holding a coated metallic plate upon said curved holder, means concentric to said holder adapted to heat the edge of said metallic plate and remove the list therefrom, and means for moving said holder with relation to the means for melting and removing the list, for the purpose set forth.

17. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, means for automatically receiving and holding a coated sheet-metal plate upon and against the periphery of said drum, and means concentric to said drum for melting and removing list or excess of metallic coating from the edge of a plate so held on said rotatable drum, for the purpose described.

18. In apparatus for removing superfluous metallic coating from sheet metal, a movable curved plate-holder of uniform radius, a series of gas-jets arranged concentric to the path of the holder for the purpose of heating the edge of a plate held thereon, and means, also concentric to the curved plate-holder, arranged to remove the liquated excess of metallic coating from the edge of the plate for the purpose described.

19. In apparatus for removing superfluous metallic coating from sheet metal, a movable curved plate-holder of uniform radius, two series of gas-jets concentric to the path of the holder, one opposed to the other, and arranged to heat opposite sides of the edge of a plate held on said holder, and means also concentric to the curved plate-holder arranged to remove the liquated excess of metallic coating from the edge of the plate for the purpose described.

20. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, means for holding a coated sheet-metal plate against the periphery of said drum, a series of gas-jets arranged concentric to one edge of said drum, for the purpose of heating the edge of a plate held thereon, and means, also concentric to the edge of said drum, arranged to remove the liquated excess of metallic coating from the edge of the plate for the purpose described.

21. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, means for holding a coated sheet-metal plate against the periphery of said drum, two series of gas-jets arranged concentric to one edge of the said drum and opposed to each other for the purpose of heating opposite sides of the edge of a plate held on said drum, and means, also concentric to the edge of the said drum, arranged to remove the liquated excess of metallic coating from the edge of the plate for the purpose described.

22. In apparatus for removing superfluous metallic coating from sheet metal, a curved plate-holder of uniform radius, means for holding a coated metallic plate thereon, concentric means for heating one of the edges of said plate to melt the list thereon, and rotatable concavo-convex brushes arranged with their opposite sides concentric with the curved plate-holder and in the path of the edge of the plate held thereon, for the purpose described.

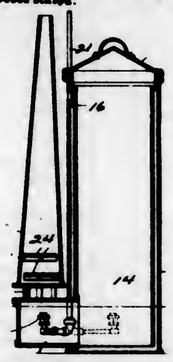
23. In apparatus for removing superfluous metallic coating from sheet metal, a rotatable drum, means for holding a coated sheet-metal plate against the periphery of said drum, concentric means for heating one of the edges of said plate to melt the list thereon, and rotatable concavo-convex brushes arranged with their opposed sides concentric with the periphery of the drum and in the path of the edge of the plate held thereon, for the purpose described.

810,852. GAS-BURNING TANK-HEATER. CHESTER C. FIFIELD, Grand Junction, Iowa. Filed June 19, 1905. Serial No. 266,354.

Claim.—1. In a tank-heater the combination of a chamber comprising two concentrically-arranged walls, spaced from each other, forming an air-chamber, the inner wall being suspended from the outer wall and open at its bottom, the outer wall being provided with air-inlet-openings near its top, a combustion-chamber secured to and extending from said walls and in communication with said air-chamber, a fuel-supply pipe and a burner swiveled thereto, said burner adapted to swing either into said combustion-chamber or into said first-named chamber.

2. In a tank-heater the combination of a chamber comprising two concentrically-arranged walls, spaced from each other, forming an air-chamber, the inner wall being suspended from the outer wall and open at its bottom and the two walls being provided with alining openings near their bottoms and the outer wall provided with an inlet near its top, a combustion-chamber extended through said alining openings and secured therein to communicate with the double-walled chamber.

3. A tank-heater comprising a double-walled air-chamber, closed at its top and open at its bottom, the outer wall closed at its bottom and provided with openings near its top, the inner wall open at its bottom covered at its top and fitted to the inside and top portion of the outer wall, a combustion-chamber fixed in coinciding openings in the lower ends of the top walls, a pipe for conveying oil fixed to the outer wall, a hydrocarbon-burner swiveled to the lower end of said pipe, a flue connected with the top of the combustion-chamber, an oil-tank fixed to the top of the pipe for conveying oil and a valve in the pipe, arranged and combined to operate in the manner set forth for the purposes stated.



810,853. CROQUET APPARATUS. GEORGE W. GRENVOLD, Manchester, Mass., assignor to The Standard Game and Toy Company, Taunton, Mass. Filed Jan. 10, 1905. Serial No. 240,675.

Claim.—1. A croquet apparatus embodying a plurality of wickets, swinging balks combined therewith and bearing letters or symbols, and a post bearing a letter or symbol forming in conjunction with those on the balks, a word.

2. A croquet apparatus embodying a plurality of wickets, swinging balks detachably combined therewith and bearing letters or symbols, and a post bearing a letter or symbol forming in conjunction with those on the balks, a word.

3. A croquet apparatus embodying a plurality of wickets, swinging balks combined therewith and bearing letters or symbols, and a polygonal post bearing a letter or symbol forming in conjunction with those on the balks, a word.

4. A croquet apparatus embodying a wicket and a balk having a support provided with means to connect it with the wicket for universal swinging movements.

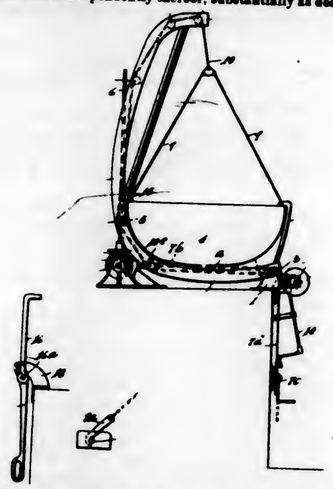
5. In a croquet apparatus, a wicket, a support provided with means to connect it with the wicket for universal swinging movements and carrying at its upper end a flag and at its lower end a balk.

810,854. SHIP'S DAVIT. JOHN W. GROFF, Albion, Mich. Filed Apr. 24, 1905. Serial No. 257,062.

Claim.—1. In a hoisting device for boats, in combination with a pivoted crane fashioned to have supporting-lines for a boat suspended from the free end and with a projection intermediate the end portions for engagement over the gunwale of the boat, a clamp member pivoted to the crane-support and adapted to coöperate with said projection in securing the boat in place, means for swinging the crane on its pivot, and means for lifting and lowering a boat, substantially as described.

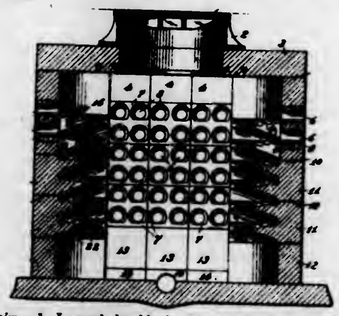
2. In a lifting device for boats, in combination with a pivoted crane-arm carrying sheaves over which lifting-lines run and having a projection on its body portion adapted to engage over one gunwale of a boat, a clamping member pivotally connected with said crane-arm adapted to coöperate with said projection in holding the boat in a position of rest by engagement over the other gunwale of the boat, a screw actuator engaging through a swiveled knot on said crane-arm whereby said crane-arm may be displaced from its position of rest, means whereby said screw may be actuated at a distance from said crane, and means for hoisting and lowering a boat suspended from the lifting-lines, substantially as described.

3. In a lifting device for boats, in combination with a pivoted arm, a clamp on said pivoted arm, a clamp pivoted to the fixed part upon which the arm is pivoted, means for swinging said arm on its pivot, and means for lifting and lowering a boat connected with said arm, but actuated independently thereof, substantially as described.



4. A davit for boats, having in combination a curved arm pivotally secured to a support and normally in a position of stable equilibrium with reference to the side of a ship, a pivoted clamping member adapted to coöperate with a portion of the arm in holding a boat in place therein, means for hoisting and lowering a boat suspended from said davit, and means arranged to be actuated independently of said hoisting means whereby said arm may be swung on its pivot, substantially as described.

810,855. MANHOLE FOR CONDUITS AND THE LIKE. WINFIELD A. HALLER, New Orleans, La., and JAMES W. BILLINGSLEY, Tivoli, N. Y., assignors to Edwin H. Sanderson, Brooklyn, N. Y.; Henry Hobart Porter, Lawrence, N. Y.; Francis Blossom, Brooklyn, N. Y., and Richmond Talbot, Tuxedo, N. Y. Filed Feb. 21, 1905. Serial No. 246,701.



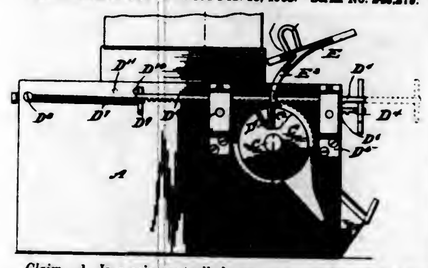
Claim.—1. In manholes, blocks alined vertically and formed with coöperating alining grooves to form manhole-walls said blocks comprising inlet-blocks and shelf-blocks formed with integral inwardly-projecting shelves provided with pockets, said shelves coöperating with said inlets to form substantially continuous supporting-shelves around the walls of the manhole between the inlets thereof and on the same level as the corresponding inlets.

2. In manholes, blocks comprising inlet-blocks and shelf-blocks united to form manhole-walls, said shelf-blocks being formed with integral inwardly-projecting shelves provided with pockets, said shelves coöperating with said inlets to form substantially continuous supporting protecting-pockets around the walls of the manhole between said inlets.

3. In manholes, blocks comprising inlet-blocks and shelf-blocks to form a manhold, said shelf-blocks being provided with a plurality of internally-projecting shelves forming continuous pockets around the walls of said manhole between inlets and on substantially the same level as the corresponding inlets, each of said shelves being provided with a plurality of said pockets.

4. In manholes, walls provided with inlets at different levels and with inwardly-projecting shelves on substantially the same levels as said inlets, the shelves on each level being provided with as many protecting-pockets as there are cables passing through the inlets on said level to provide a substantially continuous protecting-pocket for each cable between inlets.

810,856. COIN-CONTROLLED APPARATUS. ARTHUR T. HALLOCK, Canandaigua, N. Y., assignor, by mesne assignments, to Chas. B. Knox, Johnstown, N. Y. Filed Feb. 18, 1905. Serial No. 246,379.



Claim.—1. In a coin-controlled apparatus, a driving-shaft provided with a coin-wheel having means to support a coin between its sides, a gear loosely mounted upon the shaft of said coin-wheel parallel to one side thereof, a lateral extension from said gear, a finger carried by said extension and exposed between the sides of said wheel in the path of the coin held thereby, and operating means for driving said gear.

2. In a coin-controlled apparatus, a driving-shaft provided with a coin-wheel having means to support a coin between its sides, a gear loosely mounted upon the shaft of said coin-wheel adjacent thereto, a laterally-disposed guide-plate carried by the gear and covering said wheel, a depending finger at one end of said plate, and means for oscillating said gear.

3. In a coin-controlled apparatus, a driving-shaft provided with a coin-wheel having means to support a coin between its sides, a gear loosely mounted upon the shaft of said coin-wheel, a finger carried by said gear and disposed between the sides of the wheel in the path of the coin held thereby, a guard-plate carried by the gear and extending over said wheel at the rear of said finger, and a reciprocating rack-bar for driving said gear.

4. In a coin-controlled apparatus, a coin-wheel, a gear provided with a finger coöperating with said wheel, a rack-bar meshing with said gear and means constructed and arranged to permit different lengths of travel of said bar.

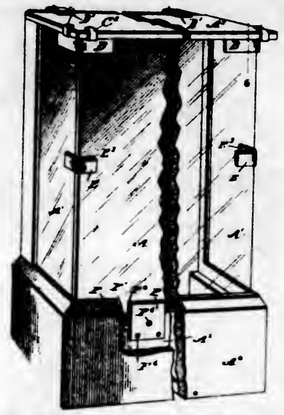
5. In a coin-controlled apparatus, a driving-shaft, a delivery device driven by said shaft provided with coin-supporting means on its opposite inner walls, a coin-wheel upon said shaft, a gear freely rotatable upon said shaft and provided with a finger coöperating with said coin-wheel, a guard extending segmentally from one side of said finger, a rack-bar mounted to reciprocate in mesh with said gear, means for limiting the travel of said rack-bar, and means for restoring said bar to its initial position.

6. In a coin-controlled apparatus, a driving-shaft, a delivery device driven by said shaft provided with coin-supporting means on its opposite inner walls, a coin-wheel upon said shaft, a gear freely rotatable upon said shaft and provided with a finger coöperating with said coin-wheel, a guard extending segmentally from one side of said finger, a rack-bar mounted to reciprocate in mesh with said gear, means for limiting the travel of said rack-bar, means for restoring said bar to its initial position, and a coin-chute adapted to deliver into said wheel at the forward side of said finger.

7. In a coin-controlled apparatus, a driving-shaft, a delivery device controlled thereby, a plurality of coin-wheels secured to said shaft each adapted to receive a coin of different denomination, and means rotatively mounted on said shaft for independently rotating each of said wheels by engagement with the coin carried thereby.

8. In a coin-controlled apparatus, a driving-shaft, a delivery device controlled thereby, a plurality of coin-wheels carried by said shaft each adapted to receive a coin of different denomination, a gear rotatable upon the shaft of said coin-wheels and provided with a finger extending between the walls thereof, and independent rack-bars for driving said gears.

810,857. SHOW-CASE. ARTHUR T. HALLOCK, Canandaigua, N. Y. Filed Apr. 22, 1905. Serial No. 256,968.



Claim.—1. The combination with a glass plate having a recessed edge, of a face-plate provided with a laterally-extending lug upon its inner face of greater depth than the thickness of the glass plate and extending through the recess therein, and a clamping-plate mounted upon the inner face of the lug and bearing upon the glass plate.

2. The combination of glass plates slotted at their intersection, of an angle-clamp comprising a face-plate, a lug extending inward at both sides of the angle thereof, a clamping-plate mounted upon said lug, means for adjusting said clamping-plate toward the face-plate, and an elastic packing upon the adjacent faces of said plates.

3. A clamp comprising a face-plate, a lug extending from one face thereof, a clamping-plate mounted upon said lug, means for adjusting said clamping-plate toward the face-plate, an elastic packing upon the adjacent faces of said plates, and a holder mounted upon the upper face of said lug and provided with hooked arms disposed at an angle to each other.

4. A plate-clamp comprising a face-plate, a lug extending from one side thereof and having an inclined face, a clamping-plate mounted upon said inclined face, and an adjusting-screw extending through said clamping-plate into said lug.

5. In a show-case, glass plates recessed at their abutting edges, an angular face-plate provided with lateral lugs disposed in said recesses and extending about the angle of the plate, and clamping-plates mounted upon said lugs to engage the inner faces of the glass plates.

6. In a show-case, abutting glass plates, a top clamp provided with means to engage said plates and an angular seat upon its upper surface, a holder having an angular portion to fit in said seat and provided with hooked arms disposed at an angle to each other to engage the top plate and means extending through said angular portion and into said seat to secure the holder thereto.

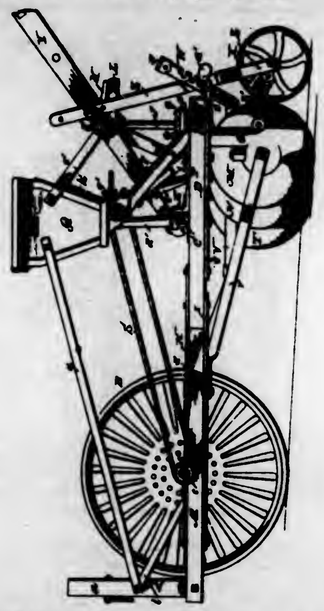
7. In a show-case comprising abutting glass plates, a clamp for frictionally engaging the lower edge of a vertical plate, a top clamp engaging the upper edges of said plates, a holder for a top plate mounted upon said top clamp, and an angle-clamp disposed intermediate of the top and bottom edges of said plates.

8. In a show-case, glass plates having ground recesses at their abutting edges, a clamp provided with a face-plate engaging the glass plates upon one side, a projection extending inwardly from said face-plate extending through said recesses, and clamping-plates mounted upon said projection to lie at an angle to the face-plate and engage the opposite face of the glass plates.

810,858. DISK DRILL. HENRY C. HAM, Liberty, Ind., assignor to Rude Brothers, Liberty, Ind., a Firm. Filed Aug. 5, 1905. Serial No. 272,879.

Claim.—1. In a disk drill, a suitable frame and an inner and an

outer wing upon each side thereof, an intermediate means pivotally connecting the outer wings with the frame, said outer and inner wings being of different lengths, disks connecting with the wings, an operating means and an intermediate means connecting therewith and with the wings whereby said wings may be simultaneously operated, substantially as and for the purpose set forth.



2. In a disk drill, outer and inner wings and disks connecting therewith, said outer wings pivotally connecting with the frame of the machine and pivotally connecting with the inner wings, and means for operating said wings, comprising an upright operating-rod and means for operating it, a link connected to the rod and pitman-rods pivotally connecting with the ends of the link and with the outer wings, and connections pivotally engaging the link and pivotally engaging the inner wings, substantially as and for the purpose described.

3. In a disk drill, a segmental or curved bar secured to the frame of the machine and having a guide-flange thereon, a plurality of pivoted wings of varying lengths, guide-brackets adjustable upon the wings and engaging the guide-flange upon the curved bar, and suitable means for operating the wings, substantially as and for the purpose specified.

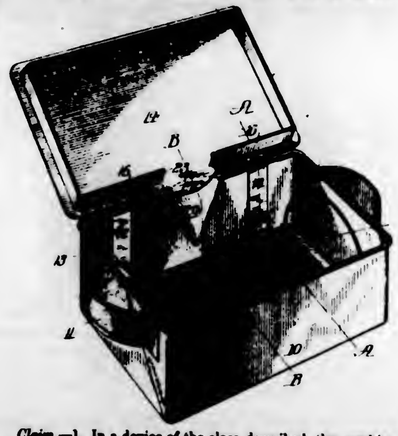
4. In a disk drill, pivoted outer and inner wings and disks connecting therewith and means for simultaneously operating said wings, a segmental or curved bar having guide-track, and brackets adjustably supported upon the wings and having guide-flanges to engage the track, the outer and inner wings being of different lengths with relation to each other, substantially as and for the purpose set forth.

5. In a disk drill, pivoted outer wings and pivoted inner wings, said wings carrying suitable disk and operating means connecting the wings with each other whereby said wings may be simultaneously operated, and a vertically-movable frame or hanger disposed between the inner wings and means for raising or lowering said frame or hanger, disks connecting with the frame or hanger and disposed at an angle to each other whereby the forward peripheries or edges of the disks will come together and a space left between the rear peripheries or edges to allow the dropping of the grain, substantially as and for the purpose described.

6. In a disk drill, pivoted outer wings and pivoted inner wings, the outer wings being of greater length than the inner wings, guide-brackets adjustably connected to the wings, a curved flanged track with which the brackets engage, a vertically-adjustable hanger or frame and truck-wheels connecting therewith, and disks suitably connected to the wings, substantially as and for the purpose specified.

7. In a disk drill, a plurality of pivoted wings and disks connecting therewith, mechanism for operating the wings, and means connecting the wings together and to said operating mechanism whereby the wings will have a simultaneous movement, a guide-track upon the frame of the machine, means upon the wings to engage said track, a vertically-movable frame or hanger disposed between the inner wings, disks connecting with the frame or hanger and arranged at an angle with each other, means for raising or lowering the frame or hanger and holding it in its adjusted position, and a vertically-adjustable frame and truck-wheels connected thereto, substantially as and for the purpose set forth.

810,859. FAMILY COOK AND FRYING PAN. PETER A. HANEGRAAF, Roseville, Ill. Filed Nov. 30, 1904. Serial No. 234,975.



Claim.—1. In a device of the class described, the combination with the pan, of the cover therefor, hinged thereto, and adapted to be turned back to support a dripping-tray, means for holding the dripping-tray in position on the turned-back cover, and means for permitting the drippings to flow back from the cover into the pan.

2. In a device of the class described, the combination with the pan, of the cover therefor hinged thereto, means for holding the cover open and in an inclined position relative to the pan and in position to receive a dripping-tray, means for holding the dripping-tray thereon, and means for permitting the drippings to flow from the cover over the edge of and into the pan.

3. In a device of the class described, the combination with a pan, of the cover therefor hinged thereto and provided with the interior flange, and means for holding the cover open and in an inclined position, said flange being provided with an opening adapted to allow the drippings to flow from the cover over the edge of and into the pan.

4. In a device of the class described, the combination with the pan, of the cover therefor hinged thereto and provided with an interior flange, means for holding the cover open and in an inclined position relative to the pan, an extension on the cover adjacent an opening provided in the flange, and an offset in the side of the pan to permit of the cover turning; all substantially as and for the purpose described.

810,860. WHEEL-FELLY. CHARLES HEART, Alexandria, Ind., assignor to Heart Metal Wheel and Gear Company, Alexandria, Ind., a Corporation of Indiana. Original application filed May 26, 1905, Serial No. 262,114. Divided and this application filed Sept. 8, 1905. Serial No. 277,487.

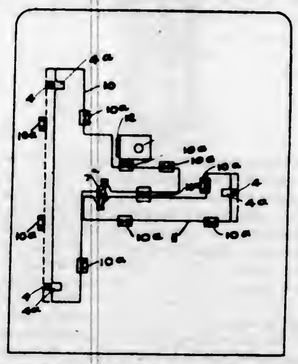
Claim.—1. A wheel including a hollow metal felly having a joint provided with a joint-piece formed of metal that is doubled over upon itself at the exterior of the felly and extending between the joint ends of the felly and against the inner sides thereof.

2. A wheel including a hollow metal felly having internal flanges at the periphery thereof, a reinforcing-band extending between the flanges of the tire and also against the inner surfaces of the flanges, and a tire engaging the reinforcing-band and also the flanges of the felly.

3. A wheel including a hollow metal felly having spoke-seats pressed in the inner face thereof and flanges extending from the spoke-seats into the interior of the felly, a filling in the felly having spoke-sockets therein, spokes engaging the spoke-seats and extending through the flanges thereof into the sockets of the filling, and a hub attached to the spokes.

4. A wheel including a hollow metal felly having internal flanges at the periphery thereof, a reinforcing-band extending between the flanges of the tire and also against the inner surfaces of the flanges, a filling in the felly having spoke-sockets therein and having its periphery in contact with the inner side of the reinforcing-band, spokes extending into the sockets of the filling, and a hub attached to the spokes.

810,861. PORTABLE FIREPROOF VAULT. WILLIAM H. HEDGES, Kansas City, Kans. Filed Feb. 2, 1904. Serial No. 191,780.



Claim.—1. A portable fire and water proof vault for safes, composed essentially of main portion, A, and a door portion, B, connected by suitable hinges, C, said vault being of such size larger than the safe to be inclosed therein as to leave vacant space between the inclosed safe and the walls of the vault for packing with suitable fireproofing material; said vault having between its main portion, A, and its door portion, B, a stepped flange-joint of the usual form, in which joint the adjustable covering-plate, 15, forms the inner or highest step, the outer or lowest step, 14, forming one wall, and the covering-band, 16, forming the other wall of a channel or groove adapted to receive and retain in place the asbestos packing, 14ª, all substantially as, and for the purposes shown and described.

2. In a portable fire and water proof vault for safes, composed essentially of a main portion, A, and a door portion, B, connected by suitable hinges, C, the door portion, B, forming one entire side of the structure, and having double walls as a feature of fireproof protection, locking mechanism located between said walls and comprising the outside operating-handle 7, the interior locking-bolts 10 and 11, and the double-warded key 7ª, connected by the conical spindle 8, all situated and coacting in the manner and for the purposes substantially as shown and described.

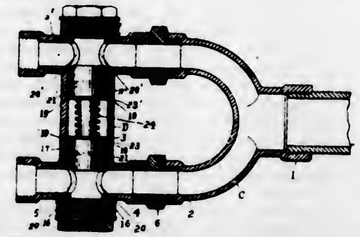
3. In a portable fire and water proof vault for safes, composed essentially of a main portion, A, and a door portion, B, connected by suitable hinges, C, the fastening-bolt passing through the door portion, B, and having a square projecting end, 1; a collar, or flange, 2; a conical head, 3; a square intermediate portion, 4, engages the notches, 4ª, of the locking-bolts 10 and 11, and a screw-threaded inner end portion engages the nut, 19, secured in the main portion, A, of the vault, all substantially as and for the purposes shown and described.

4. In a portable fire and water proof vault for safes, composed essentially of a main portion, A, and a door portion, B, connected by suitable hinges, C, a locking mechanism situated between the outer and inner walls of the door portion, B, by means of which the fastening-bolts are secured against being unscrewed, said locking mechanism comprising essentially the outside operating-handle, 7, the inside double-warded key, 7ª, the connecting conical spindle, 8, and the locking-bolts 10 and 11, having the square notches, 4ª which mesh with the square portion, 4, of the fastening-bolts, substantially in the manner, and for the purposes shown and described.

5. In a portable fire and water proof vault for safes, composed essentially of a main portion, A, and a door portion, B, connected by suitable hinges, the adjustable flange-casting or covering-plate, 15, preferably composed of three sections, the straight section, 22, and the two angle-sections, 23, 23, said pieces being pierced with oblong openings for the free passage through them of the fastening-bolts, all substantially in the manner and for the purposes shown and described.

6. In a portable fire and water proof vault for safes, composed essentially of a main portion, A, and a door portion B, connected by suitable hinges, C, the covering-band, 16, attached to the main portion, A, and projecting a suitable distance beyond the base of the outer or lower step of the flanged casting-joint between the two portions, A and B, to form with the side or riser of said step, a recess or cavity for receiving and retaining in place the asbestos packing, all substantially as and for the purposes shown and described.

810,862. SAFETY COUPLING-SECTION FOR AIR-BRAKE PIPES. WILLIAM J. HOFSTATTER, Toledo, Ohio. Filed Aug. 19, 1904. Serial No. 221,370.



Claim.—1. In a section for fluid-pressure pipes, the combination with two conduits arranged side by side, and having common connections, connecting the conduits with each other at each end, and adapted to connect the conjoined conduits as a two-way section in a main pipe-line, of a pair of pressure-actuated two-way closure-valves, one adjacent to each connection, each of said valves having opposite equal pressure areas, one for each conduit and normally open thereto, said valves being adapted to be conjointly actuated to shut off either of the conduits from the other of them and from the main line by a preponderance of pressure in the other and in the line, and means to return each valve to its normal position when the pressure is equalized in the conduits.

2. The combination with a main air-pipe of a train air-brake system, of a two-way coupling-section for disconnected parts thereof, comprising a pair of conduits arranged side by side and having a common coupling connection at each end adapted to couple the section into and make each conduit of the section thus formed continuous with the main air-pipe, and a part thereof, and a pair of two-way closure-valves common to the two conduits, adapted to close the connections of either conduit with the main pipe and with the other conduit, said valves being normally open and adapted to be held normally open by equal air-pressure in the conduits and to be operated by unequal pressures therein, to close the connections of the conduit having the least pressure, and means to return each valve to its normal position when the pressure in the conduits is equalized.

3. A two-way closure-valve comprising a cylinder closed at each end and having a central portion of its bore of increased diameter forming inner shoulders, and opposite side ports in each end portion, pipe connections extending oppositely from the ports, a piston in each end portion of the cylinder adapted to close its ports, the pistons being of equal end area, a stem connecting the inner ends of the pistons, and having a length equal to the distance between the inner shoulders of the cylinder, and the combined length of the pistons and the stem being less than the distance from the centers of the ports of one end portion to the centers of the ports of the other end portion of the cylinder, a pair of disk-collars movably mounted on the stem, and having diameters adapting them to engage the shoulders, and a helical spring mounted on the stem between the disks, the spring being adapted to normally hold the disks in engagement with the shoulders

and the inner ends of the pistons, and to yield to permit movement of the pistons to close the ports of either end portion according as the pressure in the pipe connections of one end portion of the cylinder exceeds the pressure in the pipe connections of the other end portion, substantially as set forth.

4. In a coupling-section for air-brake pipes a pair of pipes arranged side by side, each pipe of the pair having a pair of flexible hose-sections each provided with a coupler complementary to the other and adapted to connect and disconnect the hose-sections; return-bends connecting the pipes at each end with each other and adapted to connect the conjoined pipes as a two-way section of a main-line air-brake pipe, a pressure two-way closure-valve common to both pipes between the hose-sections and each return-bend, said valve being normally open as to each pipe, and adapted to be conjointly actuated by a difference in air-pressure of the two pipes to shut off either of the two pipes having the lesser pressure from the main line and its companion pipe, and means to return each valve to its normal position when the pressure in the pipes is equalized.

5. In a coupling-section for air-brake pipes a pair of pipes arranged side by side, each pipe of the pair having a pair of flexible hose-sections each provided with a coupler complementary to the other and adapted to connect and disconnect the hose-sections; return-bends connecting the pipes at each end with each other and adapted to connect the conjoined pipes as a two-way section of a main-line air-brake pipe, a pressure two-way closure-valve common to both pipes between the hose-sections and the return-bend, said valves being normally open as to each pipe, and adapted to be conjointly actuated by a difference in air-pressure of the two pipes to shut off either of the two pipes having the lesser pressure from the main line and its companion pipe springs adapted to return the valves to normal open position when the pressure in the pipes is equalized, a closure-valve for each complementary coupler-section adapted to be automatically and mechanically opened and locked in open position by the manual operation of coupling the couplers, and to be automatically and mechanically closed by the uncoupling of the coupler-sections, and a leakage-port in each coupler-valve, substantially as set forth.

6. The combination with a fluid-pressure system of a two-way closure-valve comprising a main cylinder, end cylinders of reduced diameters and equal bores secured in end portions of the main cylinder, heads closing the outer ends of the end cylinders, a piston in each end cylinder, a common stem for the pistons rigidly connecting their inner ends, a pair of disk-collars movably mounted on the stem, a helical spring mounted on the stem between the collars and normally compressing the collars oppositely against the inner ends of the pistons and the end cylinders, opposite side ports in the end cylinders between the heads and the outer ends of the pistons, adapted to be closed by the pistons, and branch pipes extending oppositely from the ports of each cylinder adapted to connect the valve into line with two lines of pipe, the piston of the valve being adapted to be operated to close either line by a preponderance of pressure in the other.

7. The combination with a main fluid-pressure pipe, of a pair of branch pipes having a common connection with the main pipe, a cylinder transverse and cross-connecting the branch pipes and having opposite ports registering with each branch pipe, a piston-valve movable in the cylinder, having opposite end portions with equal end areas, and adapted to move in either direction and close the ports of the branch pipe in the direction of the movement, a spring adapted to hold the valve normally in, and return it to, position uncovering all the ports, when the pressure in the branch pipes is equal, and to yield in the direction of movement of the valve when actuated by a preponderance of pressure in either branch to close the ports of the other.

810,863. COUPLING-SECTION FOR TRAIN AIR-PIPES. WILLIAM J. HOUGHTZER, Toledo, Ohio. Filed June 17, 1905. Serial No. 265,697.

Claim.—1. In a train air-brake pipe the combination substantially as set forth of a two-way passage extending a one-way passage, a valve-casing having lateral transverse branches coupled respectively in line with the two-way passage, and a valve-chamber transverse both passages, said two-way passage having as component parts thereof, a hose-pipe for each passage, provided with a coupler, a two-way closure-valve in the valve-chamber, having opposed equal pressure areas, and adapted to close both passages, excepting a leak in one passage, by the movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and adapted to yield to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage by escape of air from its hose-pipe.

2. In a train air-brake pipe the combination substantially as set forth of a two-way passage extending a one-way passage, a valve-casing having lateral transverse branches coupled respectively in line with the two-way passage, and a valve-chamber transverse both passages, said two-way passages having as component parts thereof, a hose-pipe for each passage, provided with a coupler, a two-way closure-valve in the valve-chamber, having opposed equal end pressure areas, and adapted to close both passages, excepting a leak in one passage, by the movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and adapted to yield to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage by escape of air from its hose-pipe, means to automatically maintain a closure of the valve so long as air escapes to the atmosphere through the hose by maintaining a preponderance of pressure on one end of the valve, and means to equalize the pressure on the valve ends and permit its return to normal open position whenever air ceases to escape from the hose.

3. In a coupling-section for car-sections of a train air-brake pipe, the combination substantially as set forth of a Y coupled to one end of a car-section, two equal lengths of pipe extending the Y branches, two unequal lengths of hose-pipe extending respectively in line with the extensions of the Y branches, a valve-casing having transverse lateral branches coupled into line respectively with and between the hose-pipes and the extensions, and a valve-chamber transverse the lines of the branches, couplers for the free ends of the hose-pipes, adapted to be coupled to a complementary duplicate coupling-section similarly extending an adjacent car-section, a two-way closure-valve in the valve-casing having opposed equal pressure areas and adapted to close both passages formed by the Y branches, their extensions, the valve-casing, and the hose-pipes, excepting a leak in one passage, by the movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and yielding to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage, by escape of air from its hose-pipe.

4. In a coupling-section for car-sections of a train air-brake pipe, the combination substantially as set forth of a Y coupled to one end of a car-section, two equal lengths of pipe extending the Y branches, two unequal lengths of hose-pipe extending respectively in line with the extensions of the Y branches, a valve-casing having transverse lateral branches coupled into line respectively with and between the hose-pipes and the extensions, and a valve-chamber transverse the lines of the branches, couplers for the free ends of the hose-pipes, adapted to be coupled to a complementary duplicate coupling-section similarly extending an adjacent car-section, a two-way closure-valve in the valve-casing having opposed equal end pressure areas and adapted to close both passages formed by the Y branches, their extensions, the valve-casing, and the hose-pipes, excepting a leak in one passage, by the movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and adapted to yield to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage by escape of air from its hose-pipe, means to automatically maintain a closure of the valve so long as air escapes to the atmosphere through the hose by maintaining a preponderance of pressure on one end of the valve, and means to equalize the pressure on the valve ends and permit the valve to return to normal open position whenever air ceases to escape from the hose.

5. In a coupling-section for car-sections of a train air-brake pipe, the combination substantially as set forth, of a Y coupled to one end of the car-section, two equal lengths of pipes extending the Y branches, a valve-casing having transverse lateral branch pipes coupled into line respectively with the pipe extensions of the Y branches, and a valve-chamber transverse the lateral branches, a two-way angle-cock having transverse branch pipes coupled into line respectively with the transverse branches of the valve-casing, hose-pipes of unequal length extending the branches of the angle-cock and provided with couplers at their outer ends, the whole constituting a two-way passage extending the one-way passage of a car-section of the main air-pipe, a two-way closure-valve in the valve-casing having opposite equal end pressure areas and adapted to close both passages, excepting a leak in one, by movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and yielding to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage, by escape of air from its hose-pipe.

6. In a coupling-section for car-sections of a train air-brake pipe, the combination substantially as set forth, of a Y coupled to one end of the car-section, two equal lengths of pipes extending the Y branches, a valve-casing having transverse lateral branch pipes coupled into line respectively with the pipe extensions of the Y branches, and a valve-chamber transverse the lateral branches, a two-way angle-cock having transverse lateral branch pipes coupled into line respectively with the transverse branches of the valve-casing, hose-pipes of unequal length extending the branches of the angle-cock and provided with couplers at their outer ends, the whole constituting a two-way passage extending the one-way passage of a car-section of the main air-pipe, a two-way closure-valve in the valve-casing having opposite equal end pressure areas and adapted to close both passages excepting a leak in one, by movement of the valve in either of opposite directions, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and yielding to permit movement of the valve in the direction of either passage having the pressure therein reduced below the pressure in the other passage, by escape of air from its hose-pipe, means to automatically maintain a closure of the valve so long as air escapes to the atmosphere through the hose by maintaining a preponderance of pressure on one end of the valve, and means to equalize the pressure on the valve ends and permit its return to normal open position whenever air ceases to escape from the hose.

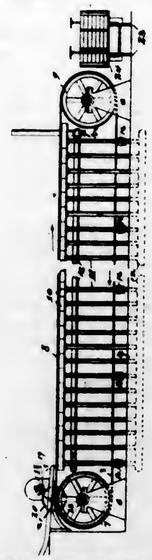
7. In a pressure-conduit the combination with a two-way passage extending and connecting a one-way passage, of a valve-casing having lateral transverse branches forming portions of each passage, and having a valve-chamber extending transverse the two passages, a reciprocating valve in the chamber, having equal end pressure areas, and adapted to close both passages by a movement of the valve in either direction of its reciprocation, a spring adapted to yieldingly hold the valve in position normally opening both passages under equal pressures in the passages, and adapted to yield to permit movement of the valve to close both passages under unequal pressures in the passages, means to automatically maintain the closure while the pressures in the passages on opposite sides of the valve are unequal, and to return the valve to its normal position opening both passages when an equilibrium of pressure is restored in the passages on opposite sides of the valve, and means to restore such equilibrium.

8. In a brake apparatus, the combination substantially as set forth of two adjacent car-sections of a train car-brake pipes each having coupled thereto a two-way coupling-section comprising a Y, pipes equally extending the branches of the Y, hose-pipes provided with complementary couplers unequally extending the pipes of the Y branches and a valve mechanism, interposed between and connecting the hose-pipes and the pipes extending the branches of the Y, constructed and operating as set forth.

9. The combination substantially as set forth of two or more consecutive car-sections of the main car-pipe of a train-brake system, each provided at each end with a two-way coupling-section comprising a Y, pipes equally extending the branches of the Y, a valve mechanism constructed and operating as set forth controlling the pipe extensions of the Y, and hose-pipes of unequal length, provided with complementary couplers uniting the adjacent valve mechanisms.

10. The combination in a two-way coupling-section for car-sections of a train air-pipe, of two lines of pipe having a common one-way connection at one end and separate hose-terminals provided with couplers at the other end and intervening valve mechanism as set forth adapted to control both lines of pipes, said valve mechanism being provided with means to close one pipe and lock the valve in position opening the other pipe, whereby the section is made adaptable to connect with and operate as a one-way coupling-section, substantially as set forth.

810,864. APPARATUS FOR CHILLING CINDER OR SLAG. FRANK K. HOOVER and ARTHUR J. MASON, Chicago, Ill. Filed Aug. 31, 1903. Serial No. 171,406.



Claim.—1. In an apparatus for chilling blast-furnace slag, the combination with an impervious endless belt on which the slag is adapted to be poured and carried away, of means located beneath the upper carrying-section of the belt adapted to support a running body of cooling-water contacting under hydrostatic pressure with the under surface of said upper belt-section, substantially as described.

2. In an apparatus for chilling blast-furnace slag, the combination with an impervious endless belt on which the slag is adapted to be poured and carried away, of a series of pans located directly beneath the upper carrying-section of the belt, and means for continuously flooding said pans with a stream of cooling-water on which said carrying-section of the belt floats, substantially as described.

3. In an apparatus for chilling blast-furnace slag, the combination with an impervious endless belt on which the slag is adapted to be poured and carried away, of a trough consisting of a series of shallow pans located directly beneath the upper carrying-section of the belt, a water-inlet pipe having branches tapping the bottoms of said pans, and water-overflow pipes freely communicating with the opposite side margins of said pans, substantially as described.

4. In an apparatus for chilling blast-furnace slag, the combination with an impervious thin endless metal conveyer-belt on which

the slag is adapted to be poured, of a trough consisting of a series of shallow pans coextensive with the width of the belt and lying directly beneath the upper carrying-section thereof, a water-inlet pipe disposed beneath said series of pans and having branches tapping the respective bottoms thereof, and water-overflow pipes freely communicating with the opposite side margins of the pans and supporting the latter, substantially as described.

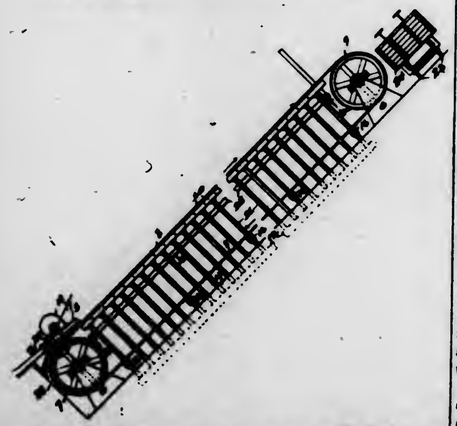
5. In an apparatus for chilling blast-furnace slag, the combination with an impervious thin endless metal conveyer-belt having its receiving end located beneath a furnace-runner to receive the slag, of a trough consisting of a continuous series of shallow pans coextensive with the width of the belt and lying directly beneath the upper carrying-section thereof, a water-inlet pipe disposed beneath and longitudinally of said series of pans and having branches tapping the respective bottoms thereof, and water-overflow pipes freely communicating with the opposite side margins of the pans at a heigh which effects a flooding of the pans and the floating of the belt on the water passed therethrough, substantially as described.

6. In an apparatus for chilling blast-furnace slag, the combination with an impervious endless conveyer-belt and means for supporting and driving the same, of means for pouring melted slag in a thin sheet onto the receiving end of said belt, means for receiving the discharge from the opposite end of said belt, and means located beneath the upper carrying-section of the belt adapted to spread a running body of cooling-water into supporting contact with substantially the entire under surface of said upper belt-section, substantially as described.

7. In an apparatus for chilling blast-furnace slag, the combination with an impervious endless thin conveyer-belt and a pair of large pulleys or drums supporting and driving the same at its opposite ends, of means for pouring liquid slag onto the upper surface of said belt, a trough consisting of a series of shallow pans located directly beneath the upper section of said belt, means for flooding said pans by a continuously-flowing stream of cooling-water which contacts and floats said upper section of the belt, overflow-pipes communicating with the side margins of said pans, and means for suitably supporting the lower or return section of the belt, substantially as described.

8. In an apparatus for chilling blast-furnace slag, the combination with the slag-runner and the cooling-water apparatus of a smelting-furnace, of means for cooling and conveying away the slag comprising an impervious traveling metal conveyer adapted to receive and transport the slag, a water-receptacle arranged in juxtaposition to the conveyer and through which the cooling-water may be circulated in contact with the conveyer, and means for conveying the water from the cooling-water apparatus of the furnace to said receptacle, as and for the purpose set forth.

810,865. METHOD OF CHILLING CINDER OR SLAG. FRANK K. HOOVER and ARTHUR J. MASON, Chicago, Ill. Filed Aug. 31, 1903. Serial No. 171,469.

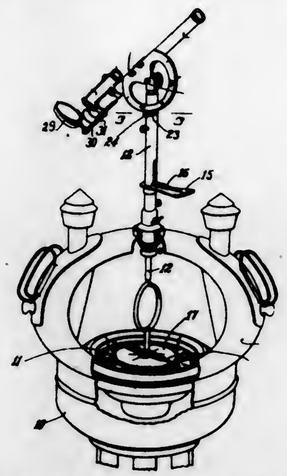


Claim.—1. The herein-described method of chilling and solidifying blast-furnace cinder or slag which consists in pouring it in the form of a thin sheet upon a thin heat-conducting surface, floating said heat-conducting surface upon a stream of constantly-flowing cooling-water maintained out of contact with said cinder or slag, and imparting to said heat-conducting surface containing said cinder or slag a traveling movement on said stream of cooling-water for a period of time sufficient to enable said cinder or slag to chill and solidify thereon, substantially as described.

2. The herein-described method of chilling blast-furnace slag which consists in pouring it in a thin sheet upon a thin heat-conducting surface and applying to the other side of said heat-conducting surface in intimate contact therewith a rapidly and continuously flowing stream of cooling-water, and maintaining said cooling-water out of direct contact with said slag, substantially as described.

3. The herein-described method of chilling blast-furnace slag which consists in pouring it in a thin sheet upon a thin heat-conducting surface and simultaneously applying to the other side of said heat-conducting surface in intimate contact therewith a rapidly and continuously flowing stream of cooling-water, and maintaining said cooling-water out of direct contact with said slag, substantially as described.

810,866. COMPASS-INDICATING APPARATUS. BENJAMIN V. HOW, Weston, Mass., assignor to Arbeam Nautical Instrument Co., Boston, Mass., a Corporation of Massachusetts. Filed Sept. 19, 1905. Serial No. 279,169.



Claim.—1. In compass-indicating apparatus, a rotatable vertical shaft supported on the binnacle-top and carrying, terminally, a sighting device and a radial indicator, in combination with a circular triangulation-plate perforated centrally, graduated marginally in degrees and maintained frictionally and adjustably on the compass-dial beneath said indicator, and with a reduced downward extension of said shaft serving in such perforation, as an axis of rotation for said plate, substantially as set forth.

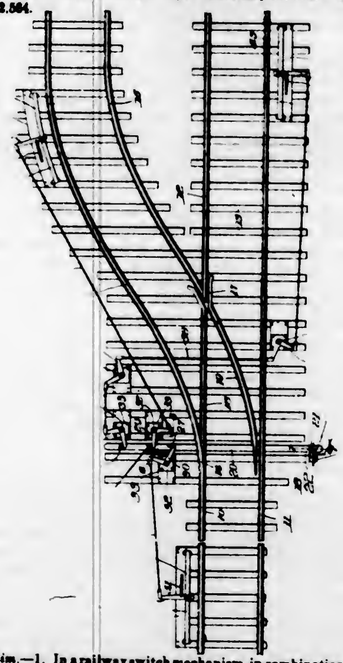
2. In compass-indicating apparatus, a rotatable vertical shaft supported on the binnacle and carrying, terminally, a sighting device and a radial indicator, normally maintained in the same vertical plane, in combination with an azimuth-tube fixed on and parallel with the sighting device, such tube having terminally a perforated eyepiece and a removable end cap carrying a colored lens, substantially as and for the purpose set forth.

3. In compass-indicating apparatus, a rotatable sectional shaft supported vertically on the binnacle, a sighting device and radial indicator connected terminally to said shaft, and a supplementary azimuth-tube fixed on said device in the same vertical plane, in combination with a concave mirror adjustably mounted on a swinging arm and adapted to converge the sun's rays at a defined point on said tube, substantially as and for the purpose set forth.

4. In compass-indicating apparatus, a rotatable sectional shaft supported vertically on the binnacle, a sighting device and radial indicator connected terminally to said shaft, and a supplementary azimuth-tube fixed on the sighting device and parallel with the axis thereof, in combination with a concave mirror mounted in bearings in a yoke carried on a swinging arm pivoted to the sighting device and furnished with a suitable step, and with a spirit-level arranged

transversely of the sighting device, to denote when the ship is on an even keel, substantially as set forth.

810,867. RAILWAY SWITCH AND SIGNAL MECHANISM. CHARLES M. HURST, Rawlins, Wyo. Filed May 27, 1905. Serial No. 262,564.



Claim.—1. In a railway switch mechanism, in combination, a slotted bridle-bar; bell-crank levers, each having a crank-pin entering one of the slots; spring-supported trips for engagement by a passing train and located respectively adjacent the switch and main tracks; rods connecting each trip mechanism with one of the bell-crank levers; the bell-crank levers controlled by the switch and main-track trips, respectively, being so mounted as to open and close the switch respectively when actuated in opposition to their retracting-springs.

2. In combination, a main railway-track; a switch-track connected therewith; a bridle-rod for actuating the switch; trip mechanism located adjacent the main track and adjacent the switch-track for engagement by a moving train; connection between such trip mechanism and the bridle-rod, and arranged reversely, whereby the action of the trip adjacent the main track will close the switch and the action of the trip adjacent the switch-track will open the switch.

3. In combination, a reciprocative bridle-rod for railway-switches; spring-retracted mechanism adapted to be actuated by a passing train and acting on the bridle-rod to move it in one direction only and independent train-actuated means for positively moving the bridle-rod in the opposite direction.

4. In combination, a pair of spring-retracted mechanisms adapted to be actuated by a passing train and each acting on the bridle-rod to move it in one direction only, the direction of action of the two mechanisms being reverse.

5. In combination, a pair of vertically-swinging spring-raised interlocking bell-crank levers; an oscillating lever; links connecting the opposite ends of the oscillating lever with each bell-crank lever; a bridle-rod having a longitudinal slot; a bell-crank carrying a pin running in the slot; and a link connecting the other arm of the last-named bell-crank with the oscillating link.

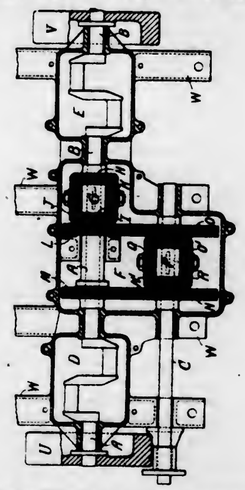
6. In combination, a bridle-bar having longitudinal slots; a pair of bell-crank levers, each having a pin engaging one of such slots; spring-returned trip mechanisms adapted to be actuated by a passing train; a link connecting each bell-crank lever with one of the trip mechanisms, such bell-crank levers being so mounted that they act in opposite directions under the influence of their respective trip mechanisms.

810,868. SWITCH AND SIGNAL TRACK TRIP. CHARLES M. HURST, Rawlins, Wyo. Filed July 8, 1905. Serial No. 268,866.

Claim.—1. In a device of the character described, in combination, a pair of levers pivoted to fixed supports and having their free ends in engagement, a shaft having a pair of crank-arms the wrist-pin of one thereof pivotally uniting the two levers, and a rod or cable leading from one of the crank-arms of said shaft.

2. In a device of the character described, in combination, a pair of levers pivoted to fixed supports and having their free ends in engagement, a crank-shaft, the wrist-pin of which pivotally unites the levers, and a rod or cable leading from a crank-arm of the shaft.

810,869. POWER-TRANSMITTING MECHANISM. JOHN B. KING, Plymouth, England. Filed Apr. 10, 1905. Serial No. 254,883.



Claim.—1. In combination, a pair of engine-shafts, differential gearing connecting said shafts, a drive-shaft, and differential gearing therefor operatively connected with one of said engine-shafts and with differential gearing therefor.

2. In combination, a pair of engine-shafts, differential gearing operatively connecting said shafts, a drive-shaft, and differential gearing therefor directly connected with one of said engine-shafts, and indirectly connected with the other.

3. In combination, a pair of alined engine-shafts, differential gearing operatively connecting said shafts, a drive-shaft, and differential gearing therefor directly connected with one of said engine-shafts and also with the differential gearing therefor.

810,870. HIGH-PRESSURE GAS-BURNER. WILLIAM KIRKWOOD, Chicago, Ill. Filed Mar. 13, 1905. Serial No. 249,894.

Claim.—1. A burner for high-pressure gas, comprising an axially-bored burner-tube, a sleeve surrounding said tube and having one or more lateral apertures substantially opposite the tip of the latter, said sleeve being provided with means for directing a part of the gas through said apertures, and an outer sleeve surrounding the end of said first-named sleeve and providing in conjunction with the latter a burner for an annular pilot-flame for the main jet, substantially as described.

2. A burner for high-pressure gas, comprising an axially-bored burner-tube, a sleeve surrounding said tube, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof and being so formed as to direct a portion of the gas through said first-named apertures, and an outer sleeve surrounding the end of said first-named sleeve and providing in conjunction with the latter a burner for an annular pilot-flame for the main jet, substantially as described.

3. A burner for high-pressure gas, comprising an axially-bored burner-tube having a contracted tip, a sleeve surrounding said tube and having a contracted end surrounding said tip, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof, and an outer sleeve secured to said last-named sleeve and having a contracted end portion surrounding the contracted end portion of the latter to provide in conjunction therewith an annular pilot-flame for the main jet, substantially as described.

4. A burner for high-pressure gas, comprising an axially-bored burner-tube having a contracted tip, a needle-valve in said burner-tube, a sleeve surrounding said tube and having a contracted end surrounding said tip, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof, an outer sleeve secured to said last-named sleeve, and having a contracted end portion surrounding the contracted end portion of the latter to provide in conjunction therewith an annular pilot-flame for the main jet, and a sleeve controlling said air-entraining apertures, said tube and sleeves being longitudinally adjustable relatively to each other, substantially as described.

810,871. SINGLE-TRIGGER MECHANISM FOR DOUBLE-BARREL GUNS. CHARLES F. LEFEVER and DANIEL M. LEFEVER, Syracuse, N. Y. Filed Feb. 14, 1906. Serial No. 301,277.

Claim.—1. In a single-trigger mechanism for double-barrel guns, the combination with the hammers, mainsprings and sears, of a trigger, a weighted pawl pivoted on the trigger to engage and trip the sear, a spring on the trigger operating to force the pawl into position to engage the sears, and a detent engaging and holding the pawl in its cocked position against the action of said spring, and means brought into action by the breaking of the gun to force the pawl into position to be engaged by the detent.

2. In combination with the hammers, mainsprings and sears, of a double-barrel breech-loading gun, of a trigger, a movable element actuated by the trigger and means to force said element into position to engage and trip one of the sears when the trigger is pulled, said element being disengaged from the sear by its own inertia and the recoil of the gun, a cocking-lever operatively connected to move said element to its inoperative position when the gun is "broken," and a detent to hold said element in its inoperative position while the gun is closed.

3. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a weighted pawl actuated by the trigger to trip one of the sears, the inertia of the pawl and the recoil of the gun coacting to disengage the pawl and sear from each other when the gun is fired, and a detent for holding the pawl in its inoperative position.

4. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a pawl on the trigger to trip the sear when the trigger is pulled, said pawl being weighted to move automatically from the sear-engaging position, a spring to hold the pawl in said engaging position, the inertia of the pawl and the recoil of the gun coacting to separate the engaging faces of the pawl and sear when the gun is fired, and a spring-detent for holding the pawl in its inoperative position.

5. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a shoulder movable manually to establish connection between the trigger and either sear separately from the other whereby either barrel may be fired successively and separate from the other barrel, a pawl actuated by the trigger and means to move said pawl into position to engage and trip the sear for said other barrel, and a cocking-lever connected to force the pawl to its inoperative position at each break of the gun.

6. The combination with the hammers, mainsprings and sears of a double-barrel breech-loading gun, of a trigger, manually-adjustable means to connect the trigger with either sear separate from the other whereby either barrel may be fired first and separate from the other after each break of the gun, and mechanism brought into action by the trigger whereby said other sear may be tripped to fire said other barrel, said mechanism including a sear-engaging pawl, a spring for forcing it to its operative position and a detent for holding it in its inoperative position, the pawl being thrown to its inoperative position by its own inertia and the recoil of the gun.

7. The combination with the hammers, mainsprings and sears of a double-barrel breech-loading gun, of a trigger, a pawl actuated by the trigger to trip the sears, said pawl being movable into and out of operative position irrespective of the trigger, and a cocking-lever operatively connected to cock the hammers and to simultaneously move the pawl to its inoperative position when the gun is broken.

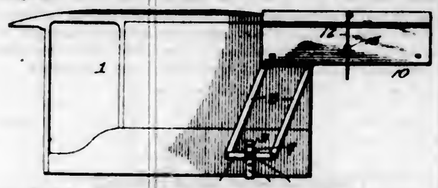
8. In combination with the hammers, mainsprings and sears of a double-barrel gun, a trigger, a trigger-plate, a pawl pivoted to the trigger and actuated to trip the sears, a spring on the trigger operating to hold the pawl in position to trip the sears as the trigger is operated, the recoil of the gun and inertia of the pawl operating to force the pawl from said position against the action of the spring.

9. In combination with the hammers, mainsprings and sears of a double-barrel gun, a trigger, a trigger-plate, a pawl pivoted to the trigger and actuated to trip the sears, a spring on the trigger operating to hold the pawl in position to trip the sears as the trigger is operated, the recoil of the gun and inertia of the pawl operating to force the pawl from said position against the action of the spring, and a spring-detent on the trigger-plate to engage and hold the pawl away from the sears.

810,872. WAGON. WILLIAM LEPPERT, Tippecanoe City, Ohio, assignor to Charles Anderson, Jr., Dayton, Ohio. Filed June 7, 1905. Serial No. 264,192.

Claim.—1. A supplemental top for vehicles adapted to be arranged above, and to be pivoted to, the main top of a vehicle, said supplemental top also adapted to be extended beyond the main top and to rest upon said main top.

2. A supplemental top for vehicles adapted to be pivoted to the top of the vehicle and to be extended beyond the main top of said vehicle and means to adjust said top to fit vehicle-tops of different heights.



3. A supplemental top for vehicles adapted to be arranged above, and to rest upon, the main top of a vehicle, said supplemental top having supporting-rods attached thereto, a bracket to which the other ends of said rods are pivoted, said bracket adapted to be secured to said main top.

4. A supplemental top for vehicles, having supporting-rods attached thereto, an adjustable bracket to which the other ends of said rods are pivoted, said bracket adapted to be secured to the body of the vehicle.

5. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges.

6. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges and means to support said awnings.

7. The combination with a fixed top of a vehicle, of a swinging supplemental top arranged above said fixed top and adapted to be extended beyond the rear end of the fixed top, said fixed top forming a stop means for the supplemental top.

8. The combination with the body and top of a vehicle, brackets secured to said body, and plates secured to said brackets, of a swinging supplemental top connected to said plates by pivoted rods, said supplemental top adapted to be extended beyond the rear end of the fixed top, said fixed top forming a stop means for the supplemental top.

9. The combination with a pivoted awning, of a rod pivoted above said awning, said rod having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of the awning and provided with a cross-pin adapted to be engaged by the teeth on said rod to hold said awning in a raised position.

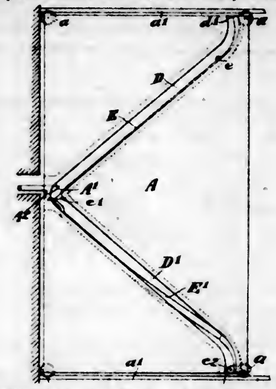
10. The combination with a pivoted awning, of a rod pivoted above said awning, said rod having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of the awning and provided with a cross-pin adapted to be engaged by the teeth on said rod and hold said awning in a raised position, said bracket also provided with a second cross-pin arranged above said first-mentioned pin for the purpose specified.

11. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges, rods pivoted to the supplemental top above said awnings, each of said rods having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of each of said awnings, said bracket provided with a cross-pin adapted to be engaged by the teeth of one of said rods to hold said awnings in a raised position.

810,873. DOOR FOR LIFTS. WILLIAM R. S. MACKAY, South Yarra, Victoria, Australia. Filed Apr. 15, 1905. Serial No. 255,851.

Claim.—1. In combination, a door-framing, a slidable door having a V-shaped path or runway arranged longitudinally thereof with its apex adjacent an edge of the door, means for locking the door to the framing, levers longitudinally arranged in said runway and extending to the apex thereof to act on said means to release the door, the outer ends of said levers being bent, and a cage movable past said door and having a projection to move in said runway for opening and closing the door and arranged to engage a lever in the runway for releasing the door, substantially as described.

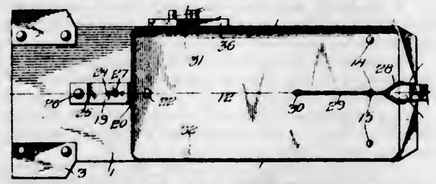
2. In combination, a door-framing, a slidable door, a pivoted latch for locking the door to the framing, said door provided with a longitudinal V-shaped groove or runway having its apex adjacent the edge of the door and said latch, the opposite ends of the runway being open, levers longitudinally arranged in the runway and extending approximately from the open ends of the runway to the apex thereof, respectively, each lever free at its inner end to engage and lift said latch and fulcrumed to swing transversely of the runway and arranged adjacent an open end of the runway to be engaged by a projection entering said end to be swung thereby to release the latch, and a cage having a projection to move longitudinally through the runway and open and close the door, substantially as described.



3. In combination, a door-framing, a slidable door having a V-shaped groove arranged longitudinally of the door and dovetailed in cross-section, said groove having vertically-disposed open opposite ends adjacent the top and bottom of the door and having its apex arranged adjacent an edge of the door, a swinging latch arranged adjacent said apex for locking the door, a pair of swinging levers arranged longitudinally in said groove and extending approximately from the open ends thereof, respectively, to the apex to engage and swing said latch, and a cage having a tapered projection to enter said groove and close and open the door and to swing said levers, substantially as described.

4. In combination, a door-framing, a slidable door having a V-shaped runway arranged longitudinally thereof with opposite open ends adjacent the top and bottom portions of the door, respectively, and having its apex arranged adjacent the vertical edge of the door, a swinging latch for locking said door and arranged adjacent said apex, a pair of bent swinging levers arranged longitudinally in said runway and extending approximately from open ends thereof, respectively, to the apex to engage and swing said latch, and a cage having a projection to move in said groove to open and close the door and to engage and swing said levers.

810,874. DITCHER AND ROAD-GRADER. JOHN D. MARTIN, Haynesville, Ky. Filed July 18, 1905. Serial No. 270,264.



Claim.—1. A reversible device of the character described comprising a runner having upper and lower guide-plates at its rear end, grooves in the outer face of its forward end, a ditching-blade connected at its inner end with the inner end of the runner for swinging movement with respect to the latter, a resilient strip secured at one end in the aforesaid groove, a draft-attaching device secured to the opposite end of the said resilient strip, the attaching device having a series of perforations therein, a rod connecting said attaching device and the scraper-blade, brackets adjustably connecting the rear end of the runner and the scraper-blade and a seat constructed and arranged for engagement with the upper and lower edges of the runner and scraper-blade.

2. A reversible device of the character described, comprising a runner, a scraper-blade secured at its inner end to the inner end of the runner for swinging movement with respect to the latter, the rear end of the scraper-blade diverging from the runner, brackets secured to the outer end of the scraper-blade and the runner, and a

810,870. HIGH-PRESSURE GAS-BURNER. WILLIAM KIRKWOOD, Chicago, Ill. Filed Mar. 12, 1906. Serial No. 305,894.

Claim.—1. A burner for high-pressure gas, comprising an axially-bored burner-tube, a sleeve surrounding said tube and having one or more lateral apertures substantially opposite the tip of the latter, said sleeve being provided with means for directing a part of the gas through said apertures, and an outer sleeve surrounding the end of said first-named sleeve and providing in conjunction with the latter a burner for an annular pilot-flame for the main jet, substantially as described.

2. A burner for high-pressure gas, comprising an axially-bored burner-tube, a sleeve surrounding said tube, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof and being so formed as to direct a portion of the gas through said first-named apertures, and an outer sleeve surrounding the end of said first-named sleeve and providing in conjunction with the latter a burner for an annular pilot-flame for the main jet, substantially as described.

3. A burner for high-pressure gas, comprising an axially-bored burner-tube having a contracted tip, a sleeve surrounding said tube and having a contracted end surrounding said tip, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof, and an outer sleeve secured to said last-named sleeve and having a contracted end portion surrounding the contracted end portion of the latter to provide in conjunction therewith an annular pilot-flame for the main jet, substantially as described.

4. A burner for high-pressure gas, comprising an axially-bored burner-tube having a contracted tip, a needle-valve in said burner-tube, a sleeve surrounding said tube and having a contracted end surrounding said tip, said sleeve having one or more lateral apertures substantially opposite the tip of the burner-tube and also one or more lateral air-entraining apertures in rear thereof, an outer sleeve secured to said last-named sleeve, and having a contracted end portion surrounding the contracted end portion of the latter to provide in conjunction therewith an annular pilot-flame for the main jet, and a sleeve controlling said air-entraining apertures, said tube and sleeves being longitudinally adjustable relatively to each other, substantially as described.

810,871. SINGLE-TRIGGER MECHANISM FOR DOUBLE-BARREL GUNS. CHARLES F. LEFEVER and DANIEL M. LEFEVER, Syracuse, N. Y. Filed Feb. 14, 1903. Serial No. 143,367.

Claim.—1. In a single-trigger mechanism for double-barrel guns, the combination with the hammers, mainsprings and sears, of a trigger, a weighted pawl pivoted on the trigger to engage and trip the sear, a spring on the trigger operating to force the pawl into position to engage the sears, and a detent engaging and holding the pawl in its cocked position against the action of said spring, and means brought into action by the breaking of the gun to force the pawl into position to be engaged by the detent.

2. In combination with the hammers, mainsprings and sears, of a double-barrel breech-loading gun, of a trigger, a movable element actuated by the trigger and means to force said element into position to engage and trip one of the sears when the trigger is pulled, said element being disengaged from the sear by its own inertia and the recoil of the gun, a cocking-lever operatively connected to move said element to its inoperative position when the gun is "broken," and a detent to hold said element in its inoperative position while the gun is closed.

3. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a weighted pawl actuated by the trigger to trip one of the sears, the inertia of the pawl and the recoil of the gun coacting to disengage the pawl and sear from each other when the gun is fired, and a detent for holding the pawl in its inoperative position.

4. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a pawl on the trigger to trip the sear when the trigger is pulled, said pawl being weighted to move automatically from the sear-engaging position, a spring to hold the pawl in said engaging position, the inertia of the pawl and the recoil of the gun coacting to separate the engaging faces of the pawl and sear when the gun is fired, and a spring-detent for holding the pawl in its inoperative position.

5. The combination with the hammers, mainsprings and sears of a breech-loading double-barrel gun, of a trigger, a shoulder movable manually to establish connection between the trigger and either sear separately from the other whereby either barrel may be fired successively and separate from the other barrel, a pawl actuated by the trigger and means to move said pawl into position to engage and trip the sear for said other barrel, and a cocking-lever connected to force the pawl to its inoperative position at each break of the gun.

6. The combination with the hammers, mainsprings and sears of a double-barrel breech-loading gun, of a trigger, manually-adjustable means to connect the trigger with either sear separate from the other whereby either barrel may be fired first and separate from the other after each break of the gun, and mechanism brought into action by the trigger whereby said other sear may be tripped to fire said other barrel, said mechanism including a sear-engaging pawl, a spring for forcing it to its operative position and a detent for holding it in its inoperative position, the pawl being thrown to its inoperative position by its own inertia and the recoil of the gun.

7. The combination with the hammers, mainsprings and sears of a double-barrel breech-loading gun, of a trigger, a pawl actuated by the trigger to trip the sears, said pawl being movable into and out of operative position irrespective of the trigger, and a cocking-lever operatively connected to cock the hammers and to simultaneously move the pawl to its inoperative position when the gun is broken.

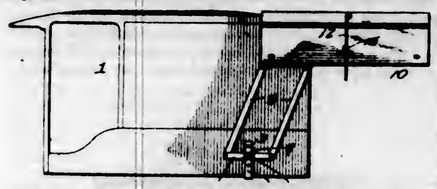
8. In combination with the hammers, mainsprings and sears of a double-barrel gun, a trigger, a trigger-plate, a pawl pivoted to the trigger and actuated to trip the sears, a spring on the trigger operating to hold the pawl in position to trip the sears as the trigger is operated, the recoil of the gun and inertia of the pawl operating to force the pawl from said position against the action of the spring.

9. In combination with the hammers, mainsprings and sears of a double-barrel gun, a trigger, a trigger-plate, a pawl pivoted to the trigger and actuated to trip the sears, a spring on the trigger operating to hold the pawl in position to trip the sears as the trigger is operated, the recoil of the gun and inertia of the pawl operating to force the pawl from said position against the action of the spring, and a spring-detent on the trigger-plate to engage and hold the pawl away from the sears.

810,872. WAGON. WILLIAM LEFFERT, Tippecanoe City, Ohio, assignor to Charles Anderson, Jr., Dayton, Ohio. Filed June 7, 1905. Serial No. 264,198.

Claim.—1. A supplemental top for vehicles adapted to be arranged above, and to be pivoted to, the main top of a vehicle, said supplemental top also adapted to be extended beyond the main top and to rest upon said main top.

2. A supplemental top for vehicles adapted to be pivoted to the top of the vehicle and to be extended beyond the main top of said vehicle and means to adjust said top to fit vehicle-tops of different heights.



3. A supplemental top for vehicles adapted to be arranged above, and to rest upon, the main top of a vehicle, said supplemental top having supporting-rods attached thereto, a bracket to which the other ends of said rods are pivoted, said bracket adapted to be secured to said main top.

4. A supplemental top for vehicles, having supporting-rods attached thereto, an adjustable bracket to which the other ends of said rods are pivoted, said bracket adapted to be secured to the body of the vehicle.

5. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges.

6. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges and means to support said awnings.

7. The combination with a fixed top of a vehicle, of a swinging supplemental top arranged above said fixed top and adapted to be extended beyond the rear end of the fixed top, said fixed top forming a stop means for the supplemental top.

8. The combination with the body and top of a vehicle, brackets secured to said body, and plates secured to said brackets, of a swinging supplemental top connected to said plates by pivoted rods, said supplemental top adapted to be extended beyond the rear end of the fixed top, said fixed top forming a stop means for the supplemental top.

9. The combination with a pivoted awning, of a rod pivoted above said awning, said rod having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of the awning and provided with a cross-pin adapted to be engaged by the teeth on said rod to hold said awning in a raised position.

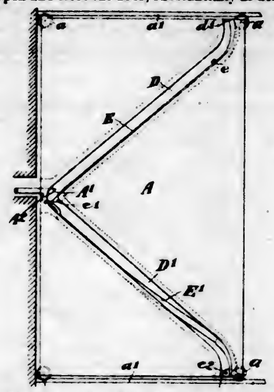
10. The combination with a pivoted awning, of a rod pivoted above said awning, said rod having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of the awning and provided with a cross-pin adapted to be engaged by the teeth on said rod and hold said awning in a raised position, said bracket also provided with a second cross-pin arranged above said first-mentioned pin for the purpose specified.

11. A supplemental top for vehicles adapted to be pivoted to the top of a vehicle and to be extended beyond the main top of said vehicle, said supplemental top having awnings attached to its lateral edges, rods pivoted to the supplemental top above said awnings, each of said rods having a series of teeth extending toward its pivoted end, and a bracket secured to the outer edge of each of said awnings, said bracket provided with a cross-pin adapted to be engaged by the teeth of one of said rods to hold said awnings in a raised position.

810,873. DOOR FOR LIFTS. WILLIAM H. S. MACKAY, South Yarra, Victoria, Australia. Filed Apr. 15, 1905. Serial No. 255,851.

Claim.—1. In combination, a door-framing, a slidable door having a V-shaped path or runway arranged longitudinally thereof with its apex adjacent an edge of the door, means for locking the door to the framing, levers longitudinally arranged in said runway and extending to the apex thereof to act on said means to release the door, the outer ends of said levers being bent, and a cage movable past said door and having a projection to move in said runway for opening and closing the door and arranged to engage a lever in the runway for releasing the door, substantially as described.

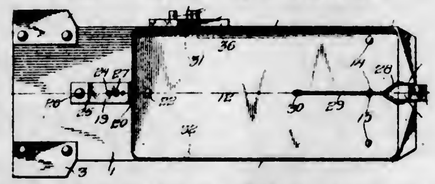
2. In combination, a door-framing, a slidable door, a pivoted latch for locking the door to the framing, said door provided with a longitudinal V-shaped groove or runway having its apex adjacent the edge of the door and said latch, the opposite ends of the runway being open, levers longitudinally arranged in the runway and extending approximately from the open ends of the runway to the apex thereof, respectively, each lever free at its inner end to engage and lift said latch and fulcrumed to swing transversely of the runway and arranged adjacent an open end of the runway to be engaged by a projection entering said end to be swung thereby to release the latch, and a cage having a projection to move longitudinally through the runway and open and close the door, substantially as described.



3. In combination, a door-framing, a slidable door having a V-shaped groove arranged longitudinally of the door and dovetailed in cross-section, said groove having vertically-disposed open opposite ends adjacent the top and bottom of the door and having its apex arranged adjacent an edge of the door, a swinging latch arranged adjacent said apex for locking the door, a pair of swinging levers arranged longitudinally in said groove and extending approximately from the open ends thereof, respectively, to the apex to engage and swing said latch, and a cage having a tapered projection to enter said groove and close and open the door and to swing said levers, substantially as described.

4. In combination, a door-framing, a slidable door having a V-shaped runway arranged longitudinally thereof with opposite open ends adjacent the top and bottom portions of the door, respectively, and having its apex arranged adjacent the vertical edge of the door, a swinging latch for locking said door and arranged adjacent said apex, a pair of bent swinging levers arranged longitudinally in said runway and extending approximately from open ends thereof, respectively, to the apex to engage and swing said latch, and a cage having a projection to move in said groove to open and close the door and to engage and swing said levers.

810,874. DITCHER AND ROAD-GRADER. JOHN D. MARTIN, Haynesville, Ky. Filed July 18, 1905. Serial No. 270,264.

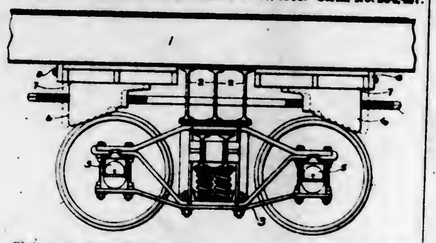


Claim.—1. A reversible device of the character described comprising a runner having upper and lower guide-plates at its rear end, grooves in the outer face of its forward end, a ditching-blade connected at its inner end with the inner end of the runner for swinging movement with respect to the latter, a resilient strip secured at one end in the aforesaid groove, a draft-attaching device secured to the opposite end of the said resilient strip, the attaching device having a series of perforations therein, a rod connecting said attaching device and the scraper-blade, brackets adjustably connecting the rear end of the runner and the scraper-blade and a seat constructed and arranged for engagement with the upper and lower edges of the runner and scraper-blade.

2. A reversible device of the character described, comprising a runner, a scraper-blade secured at its inner end to the inner end of the runner for swinging movement with respect to the latter, the rear end of the scraper-blade diverging from the runner, brackets secured to the outer end of the scraper-blade and the runner, and a

seat constructed to engage the upper or lower edges of the runner and the scraper-blade.

810,875. STEAM-SHOVEL SUPPORT. LUDOLPH P. MARTIN, Milwaukee, Wis., assignor to Allis-Chalmers Company, Milwaukee, Wis., a Corporation of New Jersey. Filed Oct. 26, 1905. Serial No. 284,427.



Claim.—1. A holding device comprising a base, a rollable member and means operable between the member and base to maintain a spaced relation therebetween.

2. A holding device comprising a base, a wheel, and means to engage the wheel and maintain the base in position.

3. A base, members movably supporting the base, and means operable between the member and base to maintain the distance therebetween.

4. A tiltable base, rollable members having axles, and means on the base to take the tilting strain off the axles.

5. A base, rollable members having treads, and means operable on the treads to maintain the base in position.

6. A base, a pair of wheels and a pair of blocks to engage the wheels and base.

7. A base, a pair of wheels, a pair of blocks guided by the base, and means to move the blocks.

8. A base, two wheels, two blocks, and means to simultaneously move the blocks onto the wheels to maintain the base in position.

9. A longitudinally-movable rotatable member, a wedge-block engaged thereby and a pair of elements spaced by the block, one of which elements is a wheel.

10. A pair of wedge-blocks, a longitudinally-movable rod, a base having guides for the blocks and wheels engaged by the blocks.

11. A base, a frame medially supporting the base, and means positively preventing tilting of the base on the frame.

810,876. RAILROAD-TIE. EDWARD MURRAY, Chicago, Ill. Filed July 6, 1903. Serial No. 163,354.

Claim.—1. A concrete railroad-tie provided with tamping-spaces in its end portions, substantially as described.

2. A concrete railroad-tie comprising suitably-connected concrete blocks or rail-supporting portions, each provided with two vertical holes or tamping-spaces, substantially as described.

3. A concrete railroad-tie having rail-seats upon its ends and provided with tamping-spaces upon opposite sides of each said rail-seat, substantially as described.

4. A concrete railroad-tie comprising concrete blocks and means for securing the rails thereon, in combination with parallel tie-rods that connect said blocks, substantially as described.

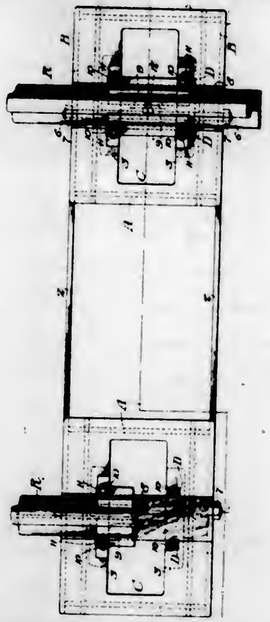
5. A concrete railroad-tie comprising concrete blocks provided with means for securing the rails thereto and each provided with side grooves or recesses, in combination with parallel tie-rods having their ends detachably secured in said side grooves, substantially as described.

6. A railroad-tie comprising blocks composed of concrete and metallic reinforcing parts embedded therein, in combination with transverse anchor bars or rods in said blocks and parallel tie-rods having their ends secured upon said anchor-rods, substantially as described.

7. A railroad-tie comprising two concrete blocks, each containing a transverse anchor-rod located in the plane of the rail-gage line, in combination with parallel tie-rods secured upon the ends of said anchor-rods, and determining the track-gage, substantially as described.

8. A railroad-tie comprising suitably-reinforced concrete blocks, each containing side grooves and each provided with a transverse anchor-rod, in combination with parallel tie-rods having their ends secured upon the ends of said anchor-rods within the side grooves of said blocks, substantially as described.

9. A railroad-tie comprising suitably-reinforced concrete blocks, each containing side grooves and each provided with a transverse anchor-rod, in combination with parallel tie-bars, having their ends secured upon the ends of said anchor-rods, within the side grooves of said blocks, said parallel bars having anchor-rod holes corresponding to the standard track-gage, substantially as described.



10. A concrete railroad-tie comprising suitably-reinforced concrete blocks provided with side grooves or recesses, in combination with parallel tie-rods having their ends secured in said grooves, substantially as described.

11. A railroad-tie comprising suitably-reinforced concrete blocks, each provided with a transverse horizontal anchor-rod having its end extending through the sides of the block, in combination with tie-rods having holes in their ends to fit upon the projecting ends of said anchor-rods, and means for securing said tie-rods thereon, substantially as described.

12. A concrete railroad-tie having tamping-spaces in its end portions and provided with horizontal anchor-plates embedded in said end portions in combination with bolts extending upwardly from said plates and a rail-securing plate upon each pair of said bolts.

13. A railroad-tie provided with vertical recesses upon each side of the rail-seat, in combination with bolts extending upwardly through said recesses, and of less diameter than said recesses, nuts upon the upper ends of said bolts, and a rail-clamping plate extending between the bolts at one side of the rail-seat and held by the nuts thereon, substantially as described.

14. An anticreeping device comprising parallel bolts and means for anchoring the lower ends thereof upon a railroad-tie, in combination with a plate to engage a rail-base and connecting the upper ends of said bolts, substantially as described.

15. An anticreeping device comprising parallel bolts and means for anchoring the lower ends thereof upon a railroad-tie, in combination with a normally curved spring-plate to engage a rail-base and connecting the upper ends of said bolts, substantially as described.

16. An anticreeping device of the class described, comprising parallel bolts and means for anchoring the lower ends thereof upon a railroad-tie, in combination with a plate connecting the upper ends of said bolts and provided with a vertical rail-web-engaging lug, having a bolt-hole, substantially as described.

17. A railroad-tie comprising suitably-connected concrete blocks provided with tamping-spaces and containing, embedded, horizontal anchor-plates, in combination with bolts, having their ends extending through said anchor-plates, nuts upon said bolts above the tops of said blocks, and horizontal plates connecting the pairs of bolts upon opposite sides of the rail-seat portions of said blocks, substantially as described.

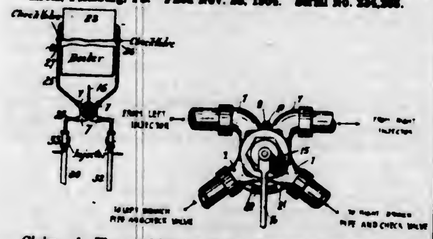
18. A railroad-tie comprising suitably-connected concrete blocks provided with tamping-spaces and containing, embedded, horizontal anchor-plates, in combination with bolts, having their ends extending through said anchor-plates, nuts upon said bolts above the tops of said blocks and horizontal plates connecting the pairs of bolts upon opposite sides of the rail-seat portions of each of said blocks, one of said plates being normally curved and the other having a vertical lug to be attached to the web of a rail, substantially as described.

19. A concrete railroad-tie having horizontal anchor-plates embedded in its end portions and provided with vertical recesses opening above and below said plates, there being also tamping-spaces in said tie communicating with said recesses, rail-fastening bolts arranged in said recesses and engaged with said plates, said plates being provided with bolt-receiving notches and depending bolt holding lugs, substantially as described.

20. A bolt-anchoring device, for concrete railroad-ties, comprising a notched plate having its corners bent downwardly at the openings of its notches, as and for the purpose specified.

21. A railroad-tie comprising suitably-connected concrete blocks each provided with a resilient rail-seat, two tamping-holes, bolt-recesses and embedded metallic anchor and reinforcing parts, substantially as described.

810,877. INJECTOR CONNECTION FOR LOCOMOTIVE-BOILERS. JAMES MCKNOWN, Pittsburg, Pa., assignor of one-half to Joseph Israel, Pittsburg, Pa. Filed Nov. 25, 1904. Serial No. 234,208.



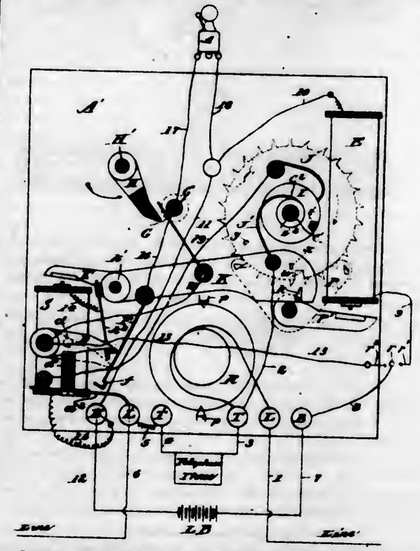
Claim.—1. The combination with a locomotive-boiler, two injectors carried on the boiler and connected therewith, two branch pipes arranged one on each side of the boiler and leading from the water-supply to the boiler, a four-way valve connected to both said branch pipes, and to both said injectors, said four-way valve being constructed and adapted to simultaneously connect the injectors each with the branch pipe on the same side of the boiler, or to connect the injector on either side with the branch pipe on the opposite side or to cut off communication between both injectors and both branch pipes.

2. The combination with a boiler, two injectors carried on the boiler, two branch pipes arranged one on each side of the boiler and means arranged intermediate of the branch pipes and the injectors whereby both injectors may be simultaneously placed in communication with the boiler through the branch pipes or either one of the injectors may be placed in communication with the branch pipe on the opposite side.

810,878. SELECTIVE CALL FOR TELEPHONES AND TELEGRAPHS. WILLIAM PALMER, Jr., Rincon, N. Mex. Filed July 12, 1902. Serial No. 116,475.

Claim.—1. A selective telephone and telegraph call, comprising a subscriber's instrument having a local battery and two local circuits, a step-by-step escapement, and a bell-switch, two electromagnets arranged one in each local circuit, one for working the step-by-step escapement and the other for adjusting the bell-switch to ringing position, a vibrating shunting-relay for sending the local-battery current through either electromagnet by a reversal of the main-line current, and a switch under the control of the subscriber for enabling him to exclusively introduce his telephone into circuit for private communication substantially as described.

2. In a selective telephone and telegraph call, the combination of an escapement-electromagnet and its armature, a pallet located on the same shaft and moving with the armature, an escapement-wheel having a deep notch varying in position on the wheel for different instruments, a lever with a tooth on one end adapted to enter the deep notch of the wheel, an armature at the other end and a switch-arm support between the two, a second electromagnet acting on said latter armature, an arm held up by said support and a contact switch-spring for the bell-circuit, a shunting disk or commutator on the escapement-wheel shaft, a short circuit controlled by said commutator to cut out the telephone, said arm being adapted to make contact with the bell-switch when the said second electromagnet is energized and to be then adjusted to a position to break the short circuit around the telephone and cut in the telephone by the act of the subscriber as described.



3. In a selective telephone and telegraph call, the combination of an escapement-electromagnet and its armature, a pallet located on the same shaft and moving with the armature, an escapement-wheel having a deep notch varying in position on the wheel for different instruments, a lever with a tooth on one end adapted to enter the deep notch of the wheel, an armature at the other end and a switch-arm support between the two, a second electromagnet acting on said latter armature, an arm held up by said support and a contact switch-spring for the bell-circuit, a shunting disk or commutator on the escapement-wheel shaft, a short circuit controlled by said commutator to cut out the telephone, said arm being adapted to make contact with the bell-switch when the said second electromagnet is energized and to be then adjusted to a position to break the short circuit around the telephone and cut in the telephone by the act of the subscriber, and a stop mechanism between the lever and escapement-wheel consisting of two engaging lugs one on the escapement-wheel and one on the lever acting together to prevent further movement of the escapement, substantially as described.

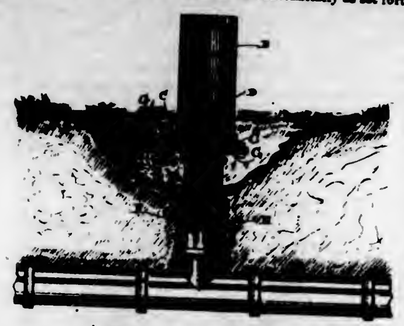
810,879. WATER-ESCAPE. BENJAMIN E. PERRY, Todds Point township, Shelby county, Ill., assignor of one-half to Charles Beverely Davis, Todds Point township, Shelby county, Ill. Filed Aug. 24, 1905. Serial No. 275,080.

Claim.—1. The herein-described water-escape consisting of the top cylinder B with the grated top A, the base-cylinder H, and the inside cylinder I with the screens D and F and the opening E all substantially as set forth and for the purposes herein specified.

2. In a water-escape, the combination, with a base-cylinder attached to the tile-drain or outlet, of a top cylinder having a suitable means of support and a removable grating, and being of sufficien length and diameter to extend above high-water mark, and to telescope about half the exposed part of the base-cylinder affording an annular passage for the escape of the water as shown and described.

3. In a water-escape, the combination, with a base-cylinder attached to the tile, drain or outlet, and a top cylinder having suitable means of support and a removable grating, and being of sufficient length and diameter to extend above the high-water mark, and to

telescope about half the exposed part of the base-cylinder, affording an annular passage for the escape of the water, of an inside cylinder provided with the screens at either end, and with the flanged top resting on the top of the said base-cylinder all substantially as set forth.

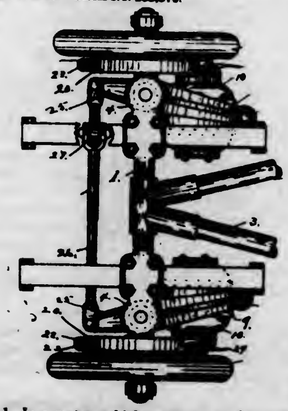


810,880. **WATER-BRAKE FOR POLES.** EVAN E. P. PUGSLEY, Indianapolis, and JAMES O. JACKSON, Swayzee, Ind.; said Jackson assignor to Samuel Bowsher. Filed Jan. 5, 1905. Serial No. 239,823.

Claim.—1. A pole composed of non-conducting material for carrying electric wires, the body, a water-brake formed integrally with the pole-body and adapted to extend circumferentially around the latter.

2. A pole composed of non-conducting material for carrying electric wires, the body, a water-brake formed integrally with the pole-body and having its lower surface cut on a plane that recedes upward and inward from the outer edge toward the pole-body.

810,881. **MOTOR-VEHICLE.** LEROY S. PFOUTS, Canton, Ohio. Filed Apr. 1, 1905. Serial No. 253,276.



Claim.—1. In a motor-vehicle, an axle provided with hollow bearing-shanks and wires located therethrough, sleeves loosely mounted upon the shanks and provided with motor-supporting stubs and stub-axles, motors secured to the stubs, arms journaled concentrically with the sleeves upon the shanks, means for communicating rotary motion from the motors to the traveling wheels, and the motors, traveling wheels and means for communicating rotary motion to said traveling wheels having common pivotal points, substantially as and for the purpose specified.

2. In a motor-vehicle, an axle provided with hollow bearing-shanks, motors carried by the shanks, gear and traveling wheels carried by the shanks, all of said parts carried by the shank and gear-casings provided with a common center, substantially as and for the purpose specified.

3. In a motor-vehicle, an axle provided with hollow bearing-shanks, motors carried by the shanks, gear and traveling wheels carried by the shanks, and all of said parts carried by the shanks provided with a common center, and the connecting-wires located through the hollow shanks, substantially as and for the purpose specified.

4. In a motor-vehicle an axle provided with vertical bearing-shanks, motors and gear and traveling wheels carried upon opposite sides of the vertical shanks, and all of said parts carried by the shanks, substantially as and for the purpose specified.

5. In a motor-vehicle, the combination of an axle provided with hollow bearing-shanks, sleeves loosely mounted upon the bearing-shanks, and provided with motor-attaching stubs, and stub-axles, arms journaled concentrically with the sleeves upon the axle-shanks, motors supported by the stubs upon the sleeves and arms, substantially as and for the purpose specified.

6. In a motor-vehicle, the combination of an axle provided with hollow bearing-shanks, sleeves loosely mounted upon the bearing-shanks and provided with motor-stubs and stub-axles, arms journaled concentrically with the sleeves upon the axles and adapted to support the rear ends of the motors, and means for cushioning the motors, substantially as and for the purpose specified.

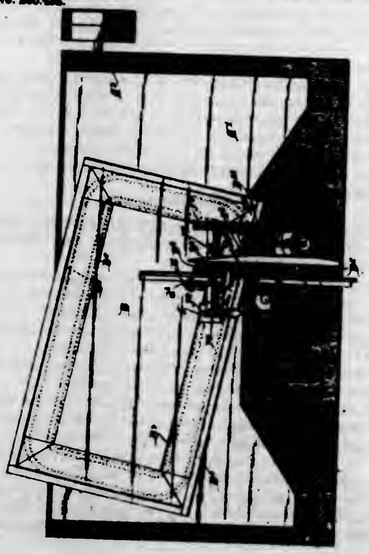
7. In a motor-vehicle, the combination of an axle provided with bearing-shanks, sleeves loosely mounted upon the bearing-shanks, and provided with motor-attaching stubs, and stub-axles, arms journaled concentrically with the sleeves upon the axle-shanks, motors supported by the stubs upon the sleeves and arms, and means for cushioning the motors, and means for steering, substantially as and for the purpose specified.

8. In a motor-vehicle, an axle provided with vertical bearing, sleeves loosely mounted upon the vertical bearings, and provided with means for carrying the traveling wheels, and motors and arms adapted to carry the rear ends of the motors, gear and gear-casings, all arranged substantially as and for the purpose specified.

9. In a motor-vehicle, an axle, motors, gear and traveling wheels all of said parts having a common and vertical pivoted bearing upon the axle, and the conducting-wires passed through the common vertical point, substantially as and for the purpose specified.

10. In a motor-vehicle, the combination of an axle provided with bearing-shanks, sleeves loosely mounted upon the bearing-shanks and provided with motor-stubs and stub-axles, gear-casings fixedly connected to the motor-casing and around or to the stub-axles, a motor-pinion and a gear-wheel meshing with the motor-pinion, substantially as and for the purpose specified.

810,883. **MATTRESS-SEWING MACHINE.** CHARLES N. PHELPS, Lagrange, Ill. Filed Aug. 31, 1901. Renewed June 15, 1905. Serial No. 265,432.



Claim.—1. A mattress-sewing machine comprising two reciprocating needle-holders operating alternately to receive the needle, to thrust one end thereof through the mattress and release the needle, means for supporting the mattress with its side and edge faces oblique to the path of movement of the needle, whereby said needle is passed through the mattress in a plane oblique to the said side and edge faces thereof, and means for imparting relative oscillatory movement to the needle-holders and the mattress-supporting means, constructed to change the inclination of the path of the needle in said oblique plane relatively to the side and edge faces of the mattress.

2. A mattress-sewing machine comprising two reciprocating needle-holders operating alternately to receive the needle, to thrust one end thereof through the mattress and release the needle, means for supporting the mattress with its side and edge faces oblique to the path of movement of the needle whereby said needle is passed through the mattress in a plane oblique to the side and edge faces thereof, and means for oscillating the supporting means and constructed to change the inclination of the path of the needle in said oblique plane relatively to the side and edge faces of the mattress.

3. A mattress-sewing machine comprising a mattress-support having a surface upon which the mattress is sustained, two reciprocating needle-holders at one side of said support and operating alternately to receive the needle, thrust one end thereof through the mattress and release the needle, said holders being arranged to direct the needle in a path oblique to the mattress-sustaining surface of the support and means for imparting relative oscillatory movement to the support and needle-holders to change the inclination of the path of the needle in said oblique plane relatively to the adjacent edge of the mattress-support.

4. A mattress-sewing machine comprising two reciprocating needle-holders operating alternately to receive the needle, thrust one end thereof through the mattress and release the needle, means for supporting the mattress with the side and edge faces thereof oblique to the path of the needle, whereby the needle is passed through the mattress in a plane oblique to said side and edge faces of the mattress, means whereby one of said holders thrusts the needle with its advance end through the mattress, means whereby the second holder receives the advance end of the needle as it is released from the first holder and draws the needle partly through the mattress, mechanism for imparting relative, oscillatory movement to the mattress-supporting means and needle-holders while one end of the needle is embedded in the mattress and thereby change the inclination of the needle in said oblique plane to the edge face of the mattress, means acting on the second holder to thereafter return the needle through the mattress in a path diverging from its former path, means whereby said needle is thereafter received by the first holder and completely withdrawn from the mattress, and means for producing a further relative oscillation of the mattress-supporting means and needle-holders at the time the needle is completely withdrawn from the mattress, whereby, when the needle is again returned through the mattress, it is returned on a path diverging from its path of last withdrawal.

5. A mattress-sewing machine comprising two reciprocating needle-holders operating alternately to receive the needle, thrust one end thereof through the mattress and release the needle, means for supporting the mattress with the side and edge face thereof oblique to the path of the needle whereby the needle is passed through the mattress in a plane oblique to said side and edge faces of the mattress, and means whereby one of said holders thrusts the needle with its advance end through the mattress, means whereby the second holder receives the advance end of the needle as it is released from the first holder and draws the needle partly through the mattress, mechanism for imparting relative, oscillatory movement to the mattress-supporting means and needle-holders while one end of the needle is embedded in the mattress and thereby change the inclination of the needle in said oblique plane to the edge face of the mattress, means acting on the second holder to thereafter return the needle through the mattress on a path diverging from its former path, means whereby said needle is thereafter received by the first holder and completely withdrawn from the mattress, and means for producing a further oscillation of the mattress-supporting means and needle-holders at the time the needle is completely withdrawn from the mattress, whereby, when the needle is again returned through the mattress, it is returned on a path diverging from its path of withdrawal, and a take-up device located at one side of the mattress for drawing the slack portion of the thread through the mattress.

6. A mattress-sewing machine, comprising two reciprocatory needle-holders operating alternately to receive the needle, thrust one end thereof through the mattress and release the needle, means for supporting the mattress with its side and edge faces oblique to the path of the needle, whereby the needle is passed through the mattress in a plane oblique to said side and edge faces, means whereby one of said holders thrusts said needle with its advance end through the mattress, means whereby the second holder receives the advance end of the needle as it is released from the first holder and draws the needle partly through the mattress, means for imparting relative, oscillatory movement to the mattress-support and needle-holders while one end of the needle is embedded in the mattress, the oscillating part swinging on an axis approximately in line with the point at which the needle is so embedded in said mattress, means acting on the second holder to thereafter return the needle through the mattress on a path diverging from its former path, means whereby the needle is thereafter received by the first holder and completely withdrawn from the mattress, and means for producing further relative oscillation of the mattress-supporting means and needle-holders, whereby, when the needle is again returned through the mattress it is returned on a path diverging from its last path of withdrawal.

7. A mattress-sewing machine comprising two reciprocatory needle-holders, a mattress-support, the sustaining-surface of which is oblique to the path of the needle, said holders acting alternately to receive the needle thrust one end thereof through the mattress and release the needle, means whereby one of said holders thrusts the needle with its advance end through the mattress, means whereby the second holder receives the advance end of the needle as it is released from the first holder and draws the needle partly through the mattress, mechanism for imparting oscillatory movement to the said mattress-support while one end of the needle is embedded in the mattress and thereby change the inclination of the needle to the edge of the mattress, means acting on the second holder to thereafter return the needle through the mattress on a path diverging from its former path, means whereby said needle is thereafter received by the first holder and completely withdrawn from the mattress, and means for producing a further oscillation of the mattress-support when the needle is withdrawn therefrom, whereby, when the needle is again returned through the mattress, it is returned on a path diverging from its last path of withdrawal.

8. A mattress-sewing machine comprising two reciprocatory needle-holders, a mattress-support the sustaining-surface of which is oblique to the path of the needle, said holders acting alternately to receive the needle, thrust one end thereof through the mattress and release the needle, means whereby one of said holders thrusts the needle with its advance end through the mattress, means whereby the second holder receives the advance end of the needle as it is released from the first holder and draws the needle partly through the mattress, mechanism for imparting oscillatory movement to the said mattress-support, while one end of the needle is embedded in the mattress and thereby changing the inclination of the needle in said oblique plane to the edge face of the mattress, means acting on the second holder to thereafter return the needle through the mattress on a path diverging from its former path, means whereby said needle is thereafter received by the first holder and completely withdrawn from the mattress, means for producing a further oscillation of the mattress-support when the needle is withdrawn therefrom, whereby, when the needle is again returned through the mattress, it is returned on a path diverging from its last path of withdrawal and means cooperating with said support oscillatory mechanism for imparting to the work-support a step-by-step advance movement as it is oscillated.

9. A mattress-side-stitching machine comprising a work-support and a needle, automatic mechanism for inserting the needle through the edge section, the filling and partly through the top section of the mattress on a path transversely oblique to the said edge and top sections of the mattress, means for returning the needle through the mattress and withdrawing it from the side section to complete the stitch, means whereby the angle of the needle and mattress is relatively changed both at the time the needle is embedded in the top section of the mattress at the middle of each stitch and when the needle is withdrawn from the edge section thereof at the end of each stitch and means for imparting a relative step-by-step movement to the mattress and needle whereby are formed blind zigzag stitches, the parts of which are diverged in the general direction of the line of stitches.

10. A mattress-sewing machine comprising a needle-actuating mechanism, a flat work-support upon the top of which the work is supported, and means for imparting oscillatory motion to the support in the plane thereof to give appropriate inclination to the stitches and to advance the work relatively to the needle-actuating mechanism.

11. A mattress-sewing machine comprising a needle-actuating mechanism, a flat work-support upon the top of which the work is supported, and means for imparting to said work-support a combined oscillatory and step-by-step bodily movement in the plane thereof.

12. A machine for the purpose specified comprising a needle-actuating mechanism, a work-support, two pivot-pins located at one side of the support and adjacent to each other and upon which the support alternately swings, said support being movable relatively to the pins, in the direction of travel of the support, and means for imparting oscillatory movement to said support on said pins.

13. A machine for the purpose specified comprising a needle-actuating mechanism, a flat work-support upon the top of which the work is supported, mechanism for advancing said work step by step to present successive parts of the work to the needle, and means operating with said support-actuating mechanism adapted to turn or rotate said support to present all sides or edges of the work thereon to the needle.

14. A mattress-sewing machine comprising a needle-actuating mechanism, a flat work-support upon the top of which the mattress is supported, mechanism for giving oscillatory movement to said support to incline the edge of the mattress to the needle-actuating mechanism, and means operating with said oscillatory mechanism for advancing said support step by step to present successive parts of the work to the needle, said means being designed to turn or rotate said support to present all sides or edges of the work thereon to the needle.

15. A machine for the purpose specified comprising a needle-actuating mechanism, a work-support, two pivot-pins, means for separately locking said pins to the support, one of said pins being released while the other is locked, and means for oscillating said support on each pin when it is locked thereto, said pins being alternately locked to the support as the support swings alternately on said pins.

16. A mattress-sewing machine comprising a needle-actuating mechanism, a flat work-support upon which the mattress is supported, and means for swinging or oscillating said support to impart thereto a progressive step-by-step movement and to incline the mattress to the needle-actuating mechanism comprising two pivot-pins located on one side of the support and adjacent to each other, and upon which the support alternately swings, said pins being separated in a direction transverse to the direction of travel of the support and means for swinging said support.

17. A machine for the purpose specified comprising a needle-actuating mechanism, a work-support, and means for swinging or oscillating said support to impart thereto a progressive step-by-step movement and to incline the support to the needle-actuating mechanism, comprising two pivot-pins, said support being provided with inner and outer parallel grooves into which the ends of said pins extend, and means for alternately swinging said support on said pins.

18. A machine for the purpose specified comprising a needle-actuating mechanism, a work-support, and means for swinging or oscillating said support to impart thereto a progressive step-by-step movement and to incline the support to the needle-actuating mechanism comprising two pivot-pins, said support being provided with inner and outer parallel grooves into which said pins extend, and the support having oscillatory movement alternately on said pins, and means for oscillating said support comprising a lever pivoted between its ends and engaging at one end one of said grooves.

19. A machine for the purpose specified, comprising needle-actuating mechanism, a work-support, said support being provided with two parallel grooves, one located inside the other, two pivot-pins which are separated in a direction transverse to the path of travel of said support, and the ends of which enter said grooves, means for swinging said support alternately on said pins and means for preventing rearward slipping of said support during its swinging movement, whereby in each swing of its movement the support is advanced one step.

20. A machine for the purpose set forth, comprising needle-actuating mechanism, a work-support, said support being provided with two continuous parallel grooves, one located inside the other, two pivot-pins located on a stationary part of the machine and the ends of which enter said grooves, means for swinging said support alternately on said pins, and means for preventing slipping of said support during its swinging movement.

21. A machine for the purpose specified comprising a needle-actuating mechanism, a horizontal work-table provided on its under side with two, inner and outer, parallel grooves, having inwardly-facing lateral shoulders, vertically-movable pivot-pins extending at their upper ends into said grooves, said pins being provided with heads adapted to engage the inwardly-facing shoulders of the grooves, means for alternately depressing each of said pins to clamp its head on the shoulders of its associated groove, while elevating the head of the other pin from the shoulders of its groove, and means for swinging or oscillating said table on said pins.

22. A machine for the purpose specified comprising a needle-actuating mechanism, a work-support and means for swinging or oscillating said support to impart thereto a progressive step-by-step movement, and to give the appropriate inclination to the stitches, comprising two pivot-pins, said table being provided with inner and outer parallel grooves, having inwardly-facing lateral shoulders, heads on said pins in said grooves, means for alternately raising and lowering said pins, an oscillatory lever for giving alternate vertical movement to said pins to clamp the heads thereof against the shoulders in the grooves, yielding connections between said oscillatory lever and the pins and means for swinging or oscillating said table.

23. A machine for the purpose specified comprising a machine-frame having a horizontal platform, a horizontal work-table supported on said platform through the medium of bearing-rollers, a stationary block on the machine-frame on which one side of the table rests, said table being provided on its under side with inner and outer parallel grooves having inwardly-facing lateral shoulders, two laterally-separated upright pivot-pins sliding in said block and extending into said grooves, heads on said pins in said grooves, means for vertically moving said pins, means for swinging said table alternately on said pins, and a needle-actuating mechanism.

24. A mattress-stitching machine comprising a flat work-table upon the top of which the mattress is supported, a needle-holder guide located at one side of and above the level of said table, said guide being inclined downwardly and outwardly, two needle-holders movable in unison in guides, one at each side of its longitudinal center, said needle-holders being each adapted to receive and hold the needle and to thrust the same through the work, means for oscillating said table in its plane to reversely incline the table to the guide-plate, and means cooperating with the oscillating means for advancing the table step by step.

25. A machine for the purpose specified comprising a horizontal work-table, a needle-holder guide-plate located at one side and above the level of said table, two needle-holders movable in said guide-plate, one on each end of its longitudinal center and each movable toward and from the center thereof, two oscillatory levers pivotally connected with said plate and with said needle-holders, endwise reciprocatory bars pivoted at their outer ends to said levers and provided at their adjacent or inner ends with grooved heads, and a rotative disk provided with an eccentric-pin adapted to alternately pass through the grooves of said heads.

26. A machine for the purpose specified comprising a horizontal work-table, a needle-holder guide-plate located at one side of and above the level of said table, said plate being inclined downwardly and outwardly and provided centrally with a downwardly-opening recess into which the work projects, two needle-holders moving in unison in said plate, one on each side of said recess, each of said holders being adapted to receive and hold the needle and to thrust the same through the work, means for separately locking said needle in said holders, tripping devices for releasing the locking means of one holder at or before the needle is received by the other holder, and means for imparting oscillatory motion to the table in unison with the movement of said needle-holders.

27. A machine for the purpose specified, comprising a double-pointed needle, mechanism for passing the needle through the work alternately from one side thereof to the other, a horizontal work-table, means for imparting oscillatory motion to said table and advancing the table step by step and means for vertically shifting the work on said table at the beginning of each stitch.

28. A machine for the purpose specified comprising a double-pointed needle, mechanism for passing the needle through the work alternately from one side thereof to the other, a horizontal work-table, means for imparting oscillatory motion to said table and advancing the table step by step, and a lifting-bar movable in unison with the needle-actuating mechanism for lifting the work at the beginning of each stitch.

29. The combination with a sewing-machine and its needle, of the class wherein one end of the thread is made fast to the work and the other or slack end is drawn by the needle through the work as the stitches are formed, of a take-up device comprising two coacting rollers between which the thread is drawn from the work.

30. The combination with a sewing-machine and its work, of the class wherein one end of the thread is made fast to the work and the other or slack end is drawn through the work as each stitch is formed, of a take-up device comprising two rollers between which the thread is drawn from the work, and means for drawing the slack portion of the thread from the needle and inserting the same between said rollers.

31. The combination with a sewing-machine and its needle, of the class wherein one end of the thread is made fast to the work and the other or slack end is drawn through the work as the stitches are formed, of a take-up device comprising two rollers between which the thread is drawn from the work, the working faces of said rollers being covered by a yielding, friction-producing material.

32. A machine for the purpose specified comprising a double-pointed needle, mechanism for passing the needle through the work alternately and in reverse directions, and a take-up mechanism comprising two rollers by which the slack portion of the thread is withdrawn from the work, and a drawing-bar adapted to pass between the needle and the slack portion of the thread to effect the introduction of the thread between said rollers.

33. A machine for the purpose specified comprising a double-pointed needle, mechanism for passing the needle through the work alternately and in reverse directions, and a take-up mechanism comprising two rollers by which the slack portion of the thread is withdrawn from the work, and a drawing-bar adapted to pass between the needle and the slack portion of the thread to effect the introduction of said thread between said rollers, said rollers being tapered at their receiving ends.

34. A machine for the purpose specified comprising a work-table, a double-pointed needle, mechanism located at the side of and above the level of the table for passing the needle through the work alternately in reverse directions, mechanism for producing relative oscillatory movement of said support and needle-actuating mechanism, and a yielding presser-foot located near the needle-actuating mechanism adapted to press the work toward the table at the beginning of each stitch.

35. A machine for the purpose specified comprising a double-pointed needle, mechanism for passing the needle through the work alternately in reverse directions, a horizontal work-table, means for producing oscillatory movement in said table and advancing the table step by step, a lifting-bar movable in unison with the needle-actuating mechanism for lifting the work at the beginning of each stitch, and a presser-foot located near said lifting-bar and adapted to press the work toward the table when the lifting-bar is in its retracted position.

810,883. REVERSING-VALVE FOR HOISTING-ENGINES.

JAMES L. PILLING, Port Huron, Mich., assignor to Pilling Air Engine Company, Detroit, Mich., a Corporation. Filed Feb. 19, 1903. Serial No. 144,080.

Claim.—1. In a controlling-valve for a hoisting-engine, in combination with a plurality of motors, a passage connected with each for the conduct of fluid thereto and for its withdrawal therefrom, a valve-casing connected with said passage, and a valve rotatable therein, said valve having in its face a plurality of passages, two arranged to register with complementary orifices in said casing, and one adapted to permit the exhaust from said motors to pass therethrough and be discharged at one end of said valve, substantially as described.

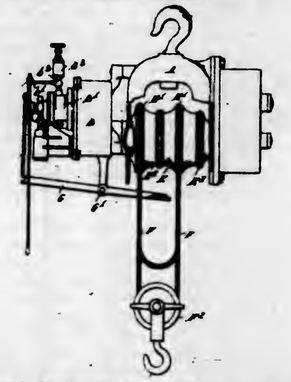
2. In a controlling-valve for a plurality of engines, a valve-seat provided with an orifice for the admission of motive fluid and with orifices for the exit-passage of said motive fluid, a valve rotating in said seat and forming with the walls thereof a passage adapted to register with either of the exit-orifices, that portion of the periphery of said valve adjacent to the containing-walls being adapted to close the inlet-orifice when there is no registration with said exit-orifices, a groove in said valve in position to register with an opening through the bushing when the motive-fluid inlet is closed, and a passage to the open air, substantially as described.

3. In a reversing-valve for a plurality of engines, the combination, with a plurality of motors, of a valve-casing, fluid-conducting passages 5 and 7 connecting the same, a conical-valve member rotatable within said casing, said member having on its surface depressions adapted to register with said passages 5 and 7, and other depressions 20 and 60 adapted to register with inlet-orifices in said casing, substantially as described.

4. In a reversing-valve for a plurality of engines, a casing provided with a plurality of orifices, a plurality of motors, a plurality of fluid-conducting means connecting said orifices and said motors, a valve member rotatable within said casing, said member having in its surface a plurality of passages adapted to register with a portion of said orifices, and other passages adapted to register with other orifices said valve member provided with a passage opening at one end thereof and at the other end adapted to communicate with the exhaust-passage from the engine.

810,884. PNEUMATIC HOIST.

JAMES L. PILLING, Bucyrus, Ohio, assignor to Pilling Air Engine Company, Detroit, Mich., a Corporation. Filed Dec. 27, 1904. Serial No. 238,536.



Claim.—1. In a hoisting mechanism, the combination of a rotatable horizontal shaft, a plurality of sprockets thereon, a loop-chain having its two strands passing over two sprockets, a motor to rotate the shaft, a throttle-valve to control said motor, and means adapted to be actuated manually or by contact with another portion of the mechanism whereby said valve may be actuated, substantially as described.

2. In a hoist, in combination with a drum, an actuating-motor, means provided with individual lubricating apparatus whereby the action of said motor may be controlled, and means arranged to simultaneously actuate said controlling means and its connected apparatus, substantially as described.

3. In a hoisting mechanism, the combination of a drum, a chain carrying a pulley engaging thereover, a motor arranged to actuate said drum, a throttle-valve controlling the action of said motor, an arm adapted to actuate the throttle-valve, a lever pivoted to a fixed portion of the mechanism, having an end extending adjacent to said chain, the other end of said arm being connected to the arm controlling the throttle-valve, said pulley being adapted to contact the adjacent end of said lever, substantially as described.

4. In a hoist, the combination of a shaft, a pair of large sprockets on said shaft, a loop-chain having its two strands passing over two sprockets on said shaft, a sheave having its wheel in one loop of said chain and a pair of sprockets of lesser diameter upon said shaft, for the purpose described.

810,885. MASSAGE-APPLICATOR.

EDWARD S. SADOWSKI, Chicago, Ill. Filed Jan. 9, 1904. Serial No. 187,673.

Claim.—1. A roller for the purpose specified comprising a cylindric roll having a resilient surface embracing projections arranged peripherally thereon, a resilient band adapted to compress the peripheral walls thereof and an open-ended tube projecting inwardly from one end of said roller.

2. A roller of the class described comprising a resilient surface

provided with spirally-arranged projections thereon, a resilient band around said roller adapted to compress the same, an inwardly-directed projection in one end of said roller and a tube thereon closed at its outer end and opening inwardly of the roller.

3. A resilient roller for the purpose specified having an interior cavity adapted to contain material at approximately a uniform temperature during use, means for applying pressure to said material, a coiled spring in said roller adapted to prevent the side walls thereof from sagging, a handle, bearings therefor seated in the ends of the roller and a plurality of sharp edged projections arranged longitudinally of the roller adapted to indent the surface treated.

4. A resilient roller of the class described comprising a casing adapted to contain material to affect the temperature of the surface treated, and affording approximately uniform temperature during treatment, a tube projecting through one end wall of the roller and having a closed outer and an open inner end opening into the casing and peripherally and spirally arranged wedge-shaped projections on said roller in longitudinal alinement and acting to depress the portions of the surface treated with which they come in contact.

5. A device of the class described comprising a resilient hollow roller, a bearing embedded in each end thereof, a resilient handle engaged in said bearings, a tube having threaded engagement at one end in one of said bearings and the other end thereof projecting a short distance into the roller and wedge-shaped projections on the outer surface of said roller adapted to depress the surface treated at the points of contact.

6. As an article of manufacture, a roller comprising a resilient receptacle adapted to contain a material adapted to affect the temperature of the roller when in operation, a spiral spring in close contact with the inner circumference of the roller adapted to hold the walls in shape, a filling-aperture in the end of said roller, a screw-plug therein, a tube projecting inwardly from said plug and a sheath of fabric or the like adapted to engage on said roller and acting to apply moisture at a given temperature of the surface treated.

7. As an article of manufacture, a cylindric roller comprising a receptacle adapted to contain a material adapted to affect the temperature of the roller when in operation, a plurality of sharp-edged wedge-shaped projections arranged longitudinally of the roller and spirally thereof, an axially-directed tube projecting into the roller from one end thereof and means for compressing said material.

8. A resilient roller of the class described comprising an inner resisting material, a sheath of resilient material such as rubber inclosing the same, projections on the exterior surface of said sheath and an outer covering of fabric separated from the sheath by said projections and adapted to apply moisture to the surface treated.

9. An article of manufacture comprising a cylindric casing, a bearing in each end thereof, a handle journaled in said bearings, an inwardly-opening tube extending inwardly from one of said bearings, a resilient covering for said casing, a plurality of wedged-shaped projections on said covering acting to indent the surface treated and a fabric engaged on said covering and normally held out of contact therewith by said projections.

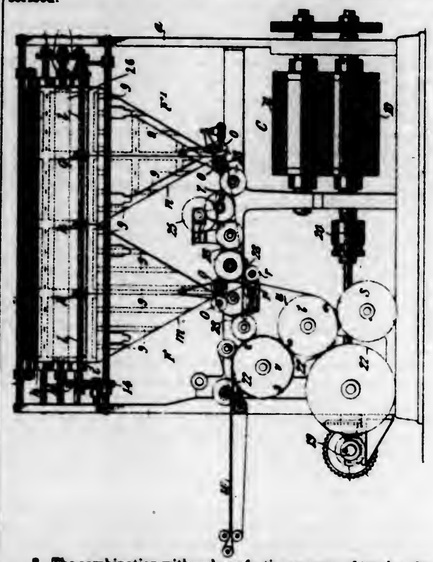
10. A device of the class described comprising a resilient cylindric casing having flexible end walls, an inwardly-directed axially-disposed projection on said end walls, a bearing in each of the same, a resilient handle adapted to engage in said bearings and force the end walls inwardly an integral inwardly-directed tubular extension on one of said bearings and means on the surface of said casing acting to indent the surface treated.

11. The combination with a cylmeric water-bottle, of an exterior resilient covering, spirally and longitudinally arranged projections thereon, an interior resisting medium, and an exterior removable sleeve of absorbent material.

12. A roller of the class described comprising a cylindric water-bag, a spiral spring within and distending the same, means admitting of filling said bag with water or the like at a preferred temperature, a band of resilient material engaging around said water-bag, peripheral projections on the bag and a sheath of fabric or the like adapted to engage on said roll outside the projections and to apply moisture and medicament to the surface at a desired temperature.

810,886. PRINTING AND DELIVERY MECHANISM. WALTER SCOTT, Plainfield, N. J. Filed Mar. 26, 1901. Serial No. 53,576.

Claim.—1. The combination with means for supplying a web or sheets, of a longitudinal folder having its V-shaped former provided with grooves extending longitudinally thereof at each side of its central longitudinal line, the grooves at one side of said line being at distances therefrom different from the distances therefrom of the grooves at the other side of said line, and a notched paste-blade for applying paste transversely of the web or sheets at points that pass over said grooves with the paste next the former, substantially as described.



2. The combination with web-perfecting presses, of two longitudinal folders each having its V-shaped former provided with grooves extending longitudinally thereof at each side of its central longitudinal line, the grooves at one side of said line being at distances therefrom different from the distances therefrom of the grooves at the other side of said line, and means for applying paste along transverse lines of the web or sheets at points which pass over said grooves with the paste next the former, substantially as described.

3. The combination with means for supplying and associating webs or sheets, of means for applying paste along transverse lines of the web or sheets before the association thereof, said paste being applied at intervals along said lines and the paste on one web or sheet coming against the other web or sheet in the intervals between the paste on that other web or sheet, and said associating means having cut-away portions or recesses over which the paste passes, substantially as described.

4. The combination with means for supplying a web or sheets, of two longitudinal folders each having grooves extending longitudinally of its V-shaped former, means for applying paste along transverse lines of said web or sheets at intervals thereof which pass over said grooves with the paste next the formers, a paster applying paste to the webs or sheets after they leave said formers and before they are associated again, and means for associating the associated webs or sheets as they move from said formers and after they receive paste from said paster, substantially as described.

5. The combination of means for supplying a plurality of webs printed upon both sides, means for printing an additional color upon one of said webs, means for applying paste at intervals along transverse lines of one of said webs, a longitudinal folder having its V-shaped former provided with longitudinally-extending grooves in that face or part coming in contact with the webs, said paste passing along said grooves without touching the former, whereby the webs are united by the paste along transverse lines thereof, and mechanism for severing the webs transversely, substantially as described.

6. The combination of a plurality of web-perfecting presses, means for printing an additional color upon one of or a part of one of said webs, means for associating said webs, means for applying paste to one of said webs to unite them as they are associated, a longitudinal folder having its V-shaped former provided with grooves extending longitudinally in that face or part thereof which comes in contact with the paper, and means for applying paste at intervals along transverse lines of the web coming in contact with said former, said paste passing along said grooves without touching the former, substantially as described.

7. The combination of a plurality of web-perfecting presses arranged one above another, a plurality of longitudinal folders arranged side by side on an upper level at the end of the framework of the machine, a printing mechanism arranged under one of said folders, and cutting and delivery mechanism arranged under another of said folders, substantially as described.

8. The combination with a plurality of web-perfecting presses, of two longitudinal folders each having its V-shaped former provided with longitudinally-extending grooves in that part thereof coming in contact with the paper, means for associating and pasting said webs together before they reach said formers, means for applying paste at intervals along transverse lines of the web coming in contact with said formers, said paste passing over said grooves without touching the formers, whereby longitudinal sections of the multiple-ply web formed by said association and pasting are united to form greater-ply webs, and means for associating and pasting together the last-named webs, substantially as described.

9. The combination of means for supplying webs, means for applying paste at intervals along transverse lines of one web, a longitudinal folder having its V-shaped former provided with longitudinally-extending grooves in that part thereof which contacts with the paper, said paste passing over said grooves without touching the former, cutting-cylinders, means whereby one of said cylinders carries cuts around with it to associate them with succeeding cuts, and means for applying paste to the cuts so carried around while they are on the last-named cylinder, substantially as described.

10. The combination of means for supplying webs, means for applying paste at intervals along transverse lines of one of said webs, a longitudinal folder having its V-shaped former provided with longitudinally-extending grooves in that part thereof which comes in contact with the paper, said paste passing over said grooves without touching the former, cutting-cylinders, means whereby one of said cutting-cylinders carries cuts around with itself to associate them with succeeding cuts, and a revolving paste-blade coacting with the last-named cylinder longitudinally thereof to apply paste to the cuts thereon, substantially as described.

11. The combination with a plurality of web-perfecting presses, of a plurality of longitudinal folders each having its V-shaped former provided with grooves extending longitudinally of that part thereof coming in contact with the paper, means for associating and pasting together said webs before they reach said formers, means for applying paste at intervals along transverse lines of the webs coming in contact with said formers, said paste passing over said grooves without touching the formers, whereby longitudinal sections of the multiple-ply web formed by said association and pasting are united to form greater-ply webs, means for associating and pasting together the last-named webs, cutting-cylinders for severing the last-formed web transversely, means whereby one of said cutting-cylinders carries around with itself cuts to associate them with succeeding cuts, and means for applying paste to the cuts so carried about on said cylinder, substantially as described.

12. The combination with a plurality of web-perfecting presses, of means for associating and pasting together said webs, a plurality of longitudinal folders each having its V-shaped former provided with grooves extending longitudinally thereof in that face or part thereof coming in contact with the paper, means for applying paste at intervals along transverse lines of the web coming in contact with the formers, said paste passing over said grooves without touching the formers, whereby longitudinal sections of the associated and pasted webs are united to form greater-ply webs, means for associating and pasting together the last-named webs, cutting-cylinders for severing the last-formed web transversely, means whereby one of said cylinders carries around with itself cuts to be associated with succeeding cuts, and a revolving paste-blade applying paste to the cuts on said cylinder, substantially as described.

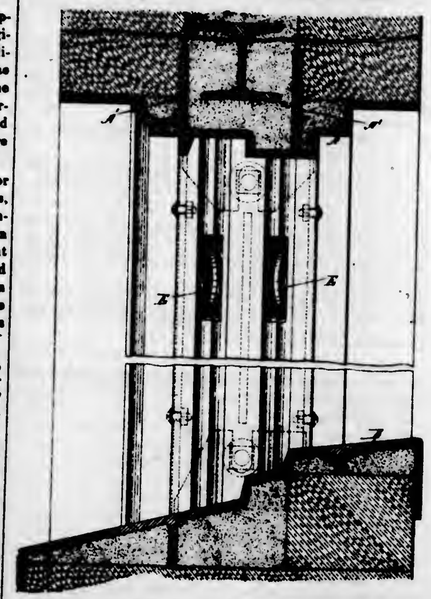
13. The combination with a web-perfecting press, of two longitudinal folders arranged side by side on an upper level in the same framework, a printing mechanism arranged under one of said folders, and cutting and folding mechanism arranged under the other of said folders, substantially as described.

14. The combination with a plurality of perfecting-presses each adapted to print wide webs, of printing mechanism adapted to add color to one side of a section of one of said webs after it has been perfected, means for superimposing said webs, V-shaped associaters for the halves of said webs, and means for associating said associated halves with said color outward.

15. The combination with a plurality of perfecting-presses each adapted to print a wide web, of printing mechanism adapted to add color to a section of one of said webs after it has been perfected, means for applying dotted lines of paste transversely of said webs, means for associating said webs, means for associating halves of said associated webs, and means for cutting, folding, and delivering.

16. The combination with a plurality of perfecting-presses each adapted to print a wide web, printing mechanism adapted to add color to one side of a section of one of said webs after it has been perfected, and means for applying dotted lines of paste transversely of said webs, of means for associating said webs, means for associating the sections of each longitudinal half of said webs, and means for associating the associated sections.

810,887. WINDOW-FRAME. HENRY C. SMITH, Boston, Mass., assignor to Smith-Warren Company, Boston, Mass., a Corporation of Massachusetts. Filed Feb. 24, 1903. Serial No. 144,687.



Claim.—1. A window-frame, the head, sill and jamb portions of which are made of cast metal, lugs having slots formed integrally by the castings with and projecting from said head and sill portions, and means whereby said jamb portions may be united with said head and sill portions through the medium of said lugs, substantially as described.

2. The combination with a window-frame the jamb portions of which are made of cast metal, of a grooved face-plate adapted to cover the jamb portions of the frame and simultaneously to provide runways for the sash or sashes.

3. The combination with a window-frame, the jamb portions of which are made of cast-iron, of an adjustable face or auxiliary plate or plates of sheet metal for the said jamb portions of the frame, and means for obtaining an adjustment of said face or auxiliary plate or plates.

4. The combination with a window-frame of a face or auxiliary plate or plates made of sheet metal for the jamb portions of the frame, and means for securing said face or auxiliary plate or plates whereby the same may be held fixed at relatively different points of lateral adjustment.

5. A window-frame, the jamb portions of which are made of cast metal provided with outwardly-extending flanges, and a grooved sheet-metal face or auxiliary plate or plates secured to said flanges for covering said jamb portions of the frame and also providing runways for the sash or sashes.

6. A window-frame, the jamb portions of which are made of cast metal provided with flanges and having slots extending in from the edges thereof, a face or auxiliary plate or plates of sheet metal secured thereto, and means for adjustably securing said face or auxiliary plate or plates to said jamb portions of the frame along said flanges, substantially as and for the purposes set forth.

7. A window-frame, the jamb portions of which are made of cast metal and which are provided with a face or auxiliary plate or plates, said face or auxiliary plate or plates, and a rib extending from said jamb-casting for strengthening the same.

8. A window-frame having jamb portions of cast metal with an opening or openings therein permitting of the insertion of sash-weights, and a face or auxiliary plate or plates covering said opening or openings and providing for the retention of the sash or sashes.

9. A window-frame having jamb portions of cast metal, the same comprising outside and inside moldings, the vertically-extending flanges c^3, c^4, and ribs c^7, c^8, and a face or auxiliary plate or plates of sheet metal secured to said jamb portions of the frame along said flanges, substantially as and for the purposes set forth.

10. A window-frame having jamb portions of cast metal with slots formed therein by the casting, and a sash-cord pulley the casing of which is adapted to fit into said slots and be supported substantially as described.

11. A window-frame having jamb portions of cast metal, a slot formed therein having beveled edges for receiving the casing in which is contained the sash-cord pulley, said casing and pulley, the casing having beveled edges to conjoin with the edges of said slot and be supported substantially as described.

12. In a window-frame, a metal casting adapted to form the jamb portions of adjacent windows.

13. A window-frame structure comprising a series of castings joined together and forming a unitary and continuous frame structure for the head and sill portions of a plurality of adjacent windows.

14. A window-frame structure comprising a series of castings joined together and forming a unitary and continous frame structure for the head, jamb and sill portions of a plurality of adjacent windows, substantially as described.

15. A window-frame, the head portion of which is formed of cast metal, and stiffening-ribs A' cast integrally with said head substantially as and for the purposes set forth.

810,888. **VEHICLE-TIRE.** CHARLES STEIN, Akron, Ohio. Filed Sept. 29, 1904. Serial No. 228,462.

Claim.—1. A combined shoe and rim, for pneumatic tires, embodying a shoe formed with meeting margins forming a seat or support for the inner periphery of the pneumatic tube, means for securing said shoe to the rim passing through the shoe at or near the meeting margins in combination with an embedded non-stretchable material, located in one of the margins.

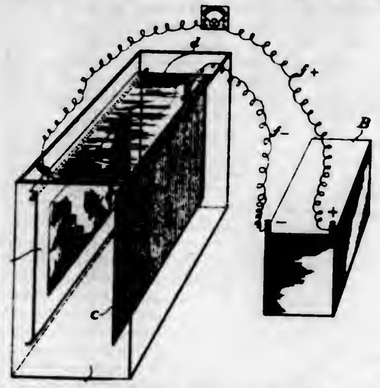
2. A combined shoe and rim for pneumatic tires, embodying a shoe formed with meeting margins forming a seat or support for the inner periphery of the pneumatic tube, means for securing said shoe to the rim passing through the shoe at or near the meeting margins, in combination with an embedded non-stretchable material located in one or both of the margins, for the purpose set forth.

3. In a vehicle-tire, the combination with an outer shoe or covering having contiguous annular edges at the base thereof, and a flap carried by one of said edges and overlapping the other of said edges, of a flanged rim in which the base of said shoe rests, a resilient tube contained within the shoe, a bolt passing through said shoe and the felly of the wheel and an annular, non-stretchable member embedded in the edge of said shoe.

4. The combination with a wheel-felly, of a rim having an integral, annular, upturned flange along one of its edges, an annular plate secured to the felly opposite said flange and extending above said rim, a shoe having contiguous annular edges or margins at the base thereof which lie between said flange and said plate, an annular, non-elastic member embedded in one of said edges, a flap or web carried by one of said edges and overlapping the other of said edges and a retaining-bolt passing through the base of the shoe, the rim and the wheel-felly.

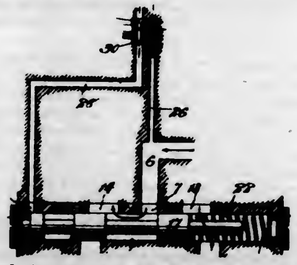
810,889. **PROCESS OF ELECTROLYTICALLY PREPARING METALS OR ALLOYS FOR LITHOGRAPHIC PURPOSES.** OTTO G. SCHNAUSS, Darmstadt, Germany. Original application filed Apr. 19, 1903. Serial No. 153,403. Divided and this application filed May 12, 1903. Serial No. 156,969.

Claim.—1. The process for producing a water-retaining layer on metal plates or alloys for lithographic and printing purposes which consists in submitting suitably-prepared plates, furnished with lithographic designs, in a suitable electrolyte to the action of a continuous current, whereby an insoluble layer will be formed by the ions of the substances in the electrolyte which will combine with the metal of the plate and thus protect the plates against lithographic oil or grease and retain the water, substantially as described.



2. The process of producing a water-retaining layer on metal plates or alloys by first submitting the plates, which have been suitably prepared and provided with a lithographic design, to the action of a continuous current, which passing from a suitable cathode to the plate to be treated causes the ions of the substances employed in the electrolytes to form a layer which consists of oxids or hydroxids of the metals applied and subsequently submitting the plate to a chemical treatment with suitable acids or chemicals by which said layer or layers will be transformed into insoluble salts of the metal or plates applied which will retain water and repulse lithographic oil or grease.

810,890. **REVERSING MECHANISM FOR ROTARY MOTORS.** ALBERT H. TAYLOR, Boston, Pa., assignor to The Ingersoll-Sergeant Drill Company, New York, N. Y., a Corporation of West Virginia. Filed July 14, 1903. Serial No. 166,007.



Claim.—1. A motor, means for supplying motive fluid thereto, a reversing-valve, a spring for holding the valve at the limit of its movement in one direction and a manually-operated auxiliary valve for controlling the movements of the reversing-valve.

2. A motor, means for supplying motive fluid thereto, a reversing-valve, a spring for yieldingly holding the valve at the limit of its movement in one direction, means for supplying the motive fluid to the reversing-valve for moving it in the opposite direction and a manually-operated auxiliary valve for controlling the supply of motive fluid to the reversing-valve.

3. The combination with the cylinder and cylinder-heads of a rotary motor and means for supplying motive fluid thereto, of a reversing-valve located in one head and a manually-operated auxiliary valve located in the other head arranged to control the movements of the reversing-valve.

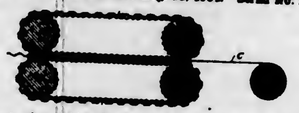
4. A motor, means for supplying motive fluid thereto, a reversing-valve, passages leading from the motive-fluid supply and the opposite sides of the motor piston-chamber to the face of the valve, a port in the valve for alternately opening communication from the fluid-supply passage to the one or the other of the motor piston-supply passages, exhaust-ports opening to the face of the said valve and ports in the valve for alternately opening communication from the one or the other of the motor piston-supply passages to the one or the other of the said exhaust-passages, a spring for moving the reversing-valve in one direction and means for controlling the supply of motive fluid for moving the valve in the opposite direction.

5. A motor, means for supplying motive fluid thereto, a reversing-valve, a spring for yieldingly holding the valve at the limit of its movement in one direction, a manually-operated valve, passages leading from the reversing-valve chamber and the motive-fluid-inlet passage to the face of the said auxiliary valve and ports in the said valve for alternately opening the passage from the motive-fluid supply to the reversing-valve passage and the reversing-valve passage to the atmosphere.

6. The combination with the cylinder and cylinder-heads of a rotary motor and means for supplying motive fluid thereto, of a reversing-valve located in a horizontal direction in one cylinder-head, a spring for holding the valve at the limit of its movement in one direction and a manually-operated auxiliary valve located in the other cylinder-head for controlling the movements of the reversing-valve.

7. The combination with the cylinder and cylinder-heads of a rotary motor and means for supplying motive fluid thereto, of a reversing-valve located in a horizontal direction in one cylinder-head, means for permitting the removal of the valve from the cylinder-head, a spring for holding the valve at the limit of its movement in one direction and a manually-operated auxiliary valve located in the other cylinder-head for controlling the movements of the reversing-valve.

810,891. **CHAIN-MACHINE FOR THE MANUFACTURE OF CORRUGATED CARDBOARD.** CAMILLE THIÉBAUT, Vitry-sur-Seine, France. Original application filed Apr. 1, 1903. Serial No. 150,680. Divided and this application filed Aug. 31, 1904. Serial No. 223,900.



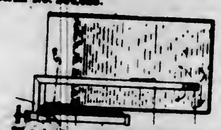
Claim.—1. A machine for the manufacture of corrugated cardboard, having the driving-shaft provided with grooves throughout their entire length, chains passing over said driving-shafts having on their under side grooves corresponding to the grooves of the shafts, and means for passing a sheet of cardboard between the chains of the machine.

2. In a chain-machine for the manufacture of corrugated cardboard, grooves on the entire length of the driving-shaft, engaging corresponding grooves of the under sides of the chains for the purpose of moving the latter.

3. In a machine for the manufacture of corrugated cardboard or paper, the combination of a plurality of endless belts having corrugated outer faces and grooved inner faces and arranged one above the other with their adjacent runs in contact, and a plurality of rollers for supporting and driving the belts, and provided with grooves coacting with the grooves of the belts.

4. In a machine for the manufacture of corrugated card board or paper, the combination of a plurality of endless belts having undulatory corrugations on their outer faces and grooves on their inner faces and arranged one above the other with their adjacent runs coacting.

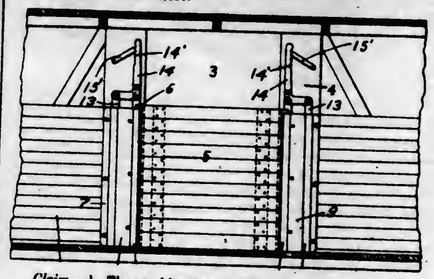
810,892. **MILK-AERATOR.** BERT H. THOMAS, Millers Station, Pa., assignor of one-half to W. K. Andrews, Millers Station, Pa. Filed June 6, 1905. Serial No. 264,628.



Claim.—1. In a device of the class described, the combination of a pair of tubes formed integral with each other, a collar adapted to rotate on said tubes, said collar being provided with means for attaching the device to a milk-can, one of said tubes having a lateral projection connected with a vertically-disposed tube, and means for forcing air through said tubes, substantially as described.

2. In a device of the class described, the combination of a pair of tubes formed integral with each other, one of said tubes having a lateral projection connecting with a vertically-disposed tube, said vertically-disposed tube being provided with a groove or way adapted to adjustably receive a convenient form of thermometer, said vertical tube being also provided at its lower end with apertures, substantially as described.

810,893. **GRAIN-DOOR.** ROBERT R. THOMSON, Pooley, Minn., assignor of one-half to Jasper M. Pogue, Pooley, Minn. Filed Mar. 31, 1905. Serial No. 253,017.



Claim.—1. The combination, with a freight-car, of casings provided upon each side of the door-opening and having transverse slots at intervals arranged one above another, of guides mounted on said casing, links pivotally connected with said guides through said slots, a bar connecting said links, means for moving said bar lengthwise to move said guides toward or from each other, and a door vertically movable between said guides.

2. The combination, with a freight-car, of casings provided on each side of the door-opening, guides mounted on said casings, links pivotally connected at one end with said guides and having a sliding connection with said casings, a vertically-movable bar connecting the free ends of said links, means for raising and lowering said bar to move said guides toward or from each other, and a door vertically movable between said guides.

3. The combination, with a freight-car, of casings provided on each side of the door-opening and having transverse slots 10, guides provided on said casings, links 12 having pivot-pins 11 extending through said slots and secured to said guides, a bar 13 connecting said links, means for raising or lowering said bars to move said guides toward or from each other, and a door provided between said guides.

4. The combination, with a freight-car, of casings provided on each side of the door-opening, guides provided on said casings, vertically-movable bars, means connecting said bars and said guides for imparting a horizontal movement to said guides when said bars are raised or lowered, bell-crank levers 14 pivoted on said casings and connected with said bars, and a door vertically movable between said guides.

5. The combination, with a freight-car, of casings provided on each side of the door-opening, guides carried by said casings and substantially V-shaped in cross-section, links slidably mounted in said casings and secured at one end to said guides, vertically-movable bars pivotally connected with the opposite ends of said links, means for raising and lowering said bars to move said guides toward or from each other, and a door having beveled ends provided between said guides.

6. The combination, with a freight-car, of casings provided upon each side of the door-opening, guides mounted on said casings, links 12 pivotally secured to said guides through transverse slots 10 in said casings, vertically-sliding bars 13 connecting said links, bell-crank levers 14 pivoted on said casings and having one arm pivotally connected with said bars 13, the other arms of said bell-crank levers extending vertically upon each side of the door-opening when the guides are in their locked position, and a door arranged to slide vertically between said guides, substantially as described.

810,894. **FLOUR-SIFTER.** WILLIAM M. VEST, Harrodsburg, Ky. Filed Jan. 23, 1904. Serial No. 191,214.

Claim.—1. A sifter, comprising a body having bearings, a handle having an opening, an agitator, and a shaft journaled in the said bearings and provided with means for connecting it to the agitator, and having a portion extending through the handle and of less diame-

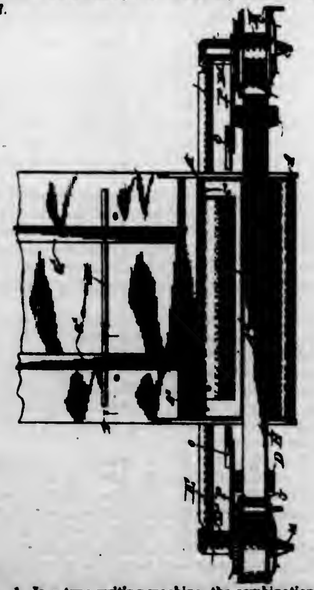
ter than the opening of the same, said portion being bent or corrugated for engaging the walls of the opening, substantially as described.

2. A sifter provided with an agitator composed of a plurality of wires spaced apart at their intermediate portions, and having their end portions twisted together and extended to form opposite journals, and means for operating the agitator, substantially as described.

3. A sifter, comprising a body, a sleve, an agitator mounted on the body, and having a projecting loop, a handle mounted on the exterior of the body, and having a longitudinal bore, and a shaft provided with corrugated or bent portions passing through the bore of the handle and frictionally engaging the latter, said shaft being also provided with an arm engaging the loop of the agitator, substantially as described.

4. A sifter provided with an agitator composed of a plurality of wires spaced apart at their intermediate portions, and having their end portions twisted together to form projecting journals, the twisted wires of one of the journals being extended and doubled to form an approximately vertical loop, and operating mechanism provided with means for engaging the loop, substantially as described.

810,895. **ATTACHMENT FOR TYPE-WRITING MACHINES.** ERNEST F. ELEBERG, Chicago, Ill. Filed May 13, 1904. Serial No. 208,497.



Claim.—1. In a type-writing machine, the combination with a paper-feed carriage, of a rod or bar carried by said carriage and having its ends projecting or extending beyond the ends of said carriage, ribbon-reels mounted to rotate upon the extending ends of said rod or bar, and means for rotatively actuating said reels.

2. In a type-writing machine, the combination with a paper-feed carriage, of a rod or bar carried by said carriage and having its ends projecting or extending beyond the ends of said carriage, ribbon-reels mounted to rotate upon the extending ends of said rod or bar, and automatic means for rotatively actuating said reels.

3. In a type-writing machine, the combination with a paper-feed carriage, of a rod or bar carried by said carriage, but incapable of movement relative thereto, said rod or bar having its ends projecting beyond the ends of said carriage, a ribbon-reel mounted to rotate upon each projecting end of said rod or bar, and means for periodically moving said ribbon-reels rotatively.

4. The combination with the paper-carriage of a type-writing machine, of a rod or bar mounted thereon to move therewith and having its ends projecting beyond the ends of said carriage, a ribbon-reel carried by each end of said rod, a ratchet-disk connected to each reel, and stationary arms carrying pawls arranged to engage said ratchet-disks to rotatively actuate said reels.

5. The combination with the paper-carriage of a type-writing machine, of a rod or arm mounted thereon to move therewith and having its ends extending beyond the ends of said carriage, a ribbon-reel supported upon each projecting end of said rod, a ratchet-disk connected to each reel, a stationary arm associated with each reel, and a movable pawl carried by each arm and coöperating with the ratchet-disk of its associated reel.

6. The combination with the paper-feed carriage of a type-writing machine, of a rod mounted upon said carriage to move therewith, a ribbon-reel carried by said rod, a ratchet-disk connected to said reel, a stationary arm, a pawl mounted upon said arm, said pawl having an elongated slot therein, whereby it is movable into and out of engaging relation with respect to said ratchet-disk.

7. The combination with the paper-feed carriage and platen of a type-writing machine, of a rod or bar mounted on said carriage to move therewith, and having its ends projecting beyond the ends of said carriage, a ribbon-reel mounted upon each projecting end of said rod or bar, pins carried by the hub of each reel and arranged to engage the ribbons, and ratchet mechanism independent of the feed movements of the platen for imparting rotary movement to said reel.

8. The combination with the paper-carriage and feed-platen of a type-writing machine, of a rod or bar carried by said carriage and having its ends projecting beyond the ends of said carriage, a ribbon-reel carried by said bar at each end thereof and each provided with means for engaging the ends of the ribbons, detachable ratchet mechanism independent of the feed movements of the platen for imparting rotation to either of said reels at will, and means for applying a tension to resist the rotative movement of such reels.

9. The combination with the paper-feed carriage of a type-writing machine, a rod or bar carried thereby and having its ends projecting beyond the ends of said carriage, a ribbon-reel mounted on each end of said rod or bar, a ratchet connected to each reel, the ratchets having their teeth presented in opposite directions, and detachable pawls respectively coöperating with said ratchet-disks, whereby the ribbons may be automatically reeled from either of said reels and coiled upon the other.

10. The combination with the paper-feed carriage and platen of a type-writing machine, of ribbon-reels mounted on said carriage to move therewith, and means independent of the feed movements of the platen for automatically actuating said reels to unwind the ribbon from one reel and to wind the same upon the other reel.

11. In an attachment for type-writing machines employing a paper-feed carriage, the combination with a reel carrying a continuous record-strip to be fed to said carriage and means for supporting said reel, of ribbon-supporting devices mounted on said carriage and arranged to support a ribbon in position for the continuous record-strip to pass between the same and the carriage-platen, means for actuating said ribbon-supporting devices to shift the ribbon, and a severing blade or cutter, mounted upon the carriage adjacent the ribbon and transverse to the line of feed of the continuous record-strip.

12. The combination with the paper-feed carriage of a type-writing machine, including a roller-platen, of ribbon-reels mounted on said carriage to move therewith, guide-rollers arranged in pairs at the opposite ends of said platen-roller and in a plane substantially tangential to the surface of the roller, the ribbons passing from one reel between the members of said pairs of guide-rollers to the other of said reels, and means for automatically rotating either of said reels.

13. In an attachment for type-writing machines employing a paper-feed carriage, the combination with a rod or bar mounted on the carriage and having its ends extending beyond the ends of the carriage of ribbon-reels mounted to rotate upon the extending ends of said rod or bar, means for rotatively actuating said reels to shift the ribbon and a record-sheet-deflector plate mounted on said rod or bar and arranged to deflect the record-sheet away from the carriage after passing the ribbon.

14. In an attachment for type-writing machines employing a paper-feed carriage, the combination with a rod or bar mounted on the carriage and having its ends extending beyond the ends of the carriage, of ribbon-reels mounted to rotate upon the extending ends of said rod or bar and a severing-blade also mounted upon said rod or bar in position to sever the record-strip after it has passed the ribbon.

15. In an attachment for type-writing machines employing a paper feed carriage, the combination with a rod or bar mounted upon the carriage and having its ends extending beyond the ends of the carriage, of ribbon-reels mounted to rotate upon the extending ends of the rod or bar, means for rotatively actuating the ribbon-reels to shift the ribbon and a severing-blade adjustably mounted upon said rod or bar and arranged in position to sever the record-strip after it has passed the ribbon.

16. In a type-writing machine the combination with a reciprocal carriage, and ribbon-reels supported upon and movable with said carriage, of a stationary bar rigidly mounted upon the machine-frame and carrying means for intermittently actuating said reels at the end of each reciprocation of the carriage.

17. In a type-writing machine, the combination with a reciprocal carriage, and horizontally-disposed ribbon-reels supported upon said carriage at opposite ends thereof and movable therewith, of a stationary bar rigidly mounted upon the frame of the machine and extending in the line of movement of the carriage, the ends thereof carrying means for intermittently actuating said reels at the end of each reciprocation of the carriage.

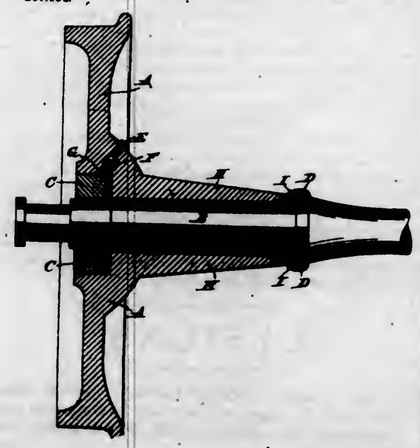
18. In a type-writing machine, the combination with a reciprocal carriage, a cylindrical platen journaled therein, and ribbon-reels supported by and movable with said carriage, of stationary means for independently actuating said reels, a stationary frame, and reels for record-paper journaled therein and located such a distance from said platen as to permit without injury of the lateral movement of the record-paper held by said platen.

19. In a type-writing machine, a stationary frame a carriage mounted to reciprocate thereon, ribbon-reels supported by and movable with said carriage, and means supported upon the stationary frame for rotatively actuating the ribbon-reels at the end of each reciprocatory movement of the carriage.

20. In a type-writing machine, the combination with a stationary frame, of a carriage mounted for reciprocatory movement thereon, ribbon-reels supported by and movable with said carriage and disposed on opposite sides respectively of said carriage, and detachable devices mounted upon the stationary frame for rotatively actuating said reels.

21. In a type-writing machine, the combination with a carriage mounted to reciprocate, a platen mounted thereon to move therewith, and ribbon-reels also supported by and movable with said carriage, a stationary frame for supporting record-paper to be supplied between the platen and ribbon, said stationary frame being located a sufficient distance from the reciprocatory carriage as to permit the reciprocations of said carriage without injury to the record-paper.

810,896. **FREE-RUNNING WHEEL.** MATT MARIKULA and AUGUST RANTALA, Fort Bragg, Cal. Filed June 26, 1905. Serial No. 267,104.

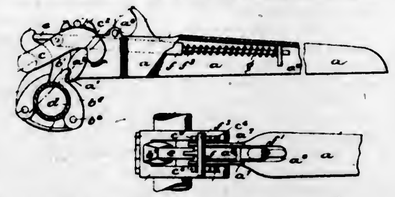


Claim.—1. The improvement in wheels free to turn on their axles, consisting of a flanged friction-face at the end of a lengthened hub; of a reciprocal friction-face against which the flanged face bears, the reciprocal friction-face being on a shoulder on the axle; of an internal friction-face on the hub which bears against the friction-face of a retaining-ring having on it a journal-bearing for part of the hub of a free-turning wheel; and of a two-part auxiliary journal for the hub of a free-turning wheel, one of the parts of said auxiliary journal being the back of a retaining-ring lying within the hub of a free-turning wheel and being secured to the axle, and the other part of the auxiliary journal being that part of the axle which lies between the retaining-ring and the shoulder on the axle provided with the reciprocal friction-face, in combination with a wheel pressed on the other end of the axle in the usual manner as herein specified.

2. The combination with a car-axle provided with bearings at its ends, of a two-part auxiliary journal for the hub formed of the back of the retaining-ring and of that part of the axle which lies between the retaining-ring C and the shoulder D, said retaining-ring being securely fastened to the axle and acting with the shoulder D in holding the flanged friction-face on the hub in contact with the reciprocal face on the shoulder D, and the internal friction-face of the hub in contact with the friction-face on the retaining-ring C, thereby keeping the free-turning wheel in its position on the axle, substantially as herein described.

REISSUES.

12,438. **PIPE-WRENCH.** EBENEZER FISHER, Philadelphia, Pa., assignor, by direct and mesne assignments, to Fisher Wrench Company, Egg Harbor, N. J., a Corporation of New Jersey. Filed June 28, 1905. Serial No. 267,460. Original No. 773,933, dated Nov. 1, 1904.



Claim.—1. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end of said loop, a link connection between the outer end of said loop and said supporting member wholly without the confines of said loop, and means whereby said link connection is normally pressed in the direction of said loop, substantially as and for the purpose set forth.

2. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end of said loop, and a link member carrying the other end of said loop and having a fulcrum bearing on said supporting member adapted to change the center upon which said link member swings during the gripping operation, substantially as and for the purpose set forth.

3. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end of said loop, and a link member carrying the other end of said loop, and having a fulcrum-hook bearing on a fulcrum on said main support whereby the fulcrum-point of said link is adapted to move from the point of said hook to within the same during the application of the leverage, substantially as and for the purpose set forth.

4. In a gripping device, the combination of a main supporting member, and a gripping-loop connected to said member and on which the latter is also fulcrumed, the engaging surfaces at the fulcrum-point having diverging faces, whereby the initial leverage applies pressure to compress the loop and the pressure of the continued leverage is diverted to apply a wrenching action to said loop, substantially as and for the purpose set forth.

5. In a gripping device, the combination of a main supporting-lever, and a gripping-loop connected to said supporting-lever and on which said lever is also fulcrumed, the fulcrum-engaging surface on said lever having diverging faces, whereby the initial leverage applies pressure to compress the loop and the pressure of the continued leverage is diverted in part to apply a wrenching action without increasing the loop compression beyond a predetermined limit, substantially as and for the purpose set forth.

6. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end thereof, a link carried by said supporting member and adapted to bear on said loop, and pressure means in engagement with said loop, substantially as and for the purpose set forth.

7. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end thereof, a link carried by said supporting member and adapted to bear on said loop adjacent its other end, and pressure means in engagement with the said latter end of the loop, substantially as and for the purpose set forth.

8. A gripping device comprising a gripping-loop, a main supporting member adapted to fulcrum on one end of said loop, a link carried by said supporting member adapted to bear on the other end of said loop, and yielding means for holding said last-mentioned end in engagement with said link, substantially as and for the purpose set forth.

9. A gripping device comprising a segmental gripping-loop, a main supporting member adapted to fulcrum on one end thereof, a link carried by said supporting member and adapted to bear on the other end segment of the loop intermediate the ends of said segment, and pressure means for engagement with the outer end of said segment, substantially as and for the purpose set forth.

10. A gripping device comprising a segmental gripping-loop, a main supporting member adapted to fulcrum on one end thereof, a link carried by said supporting member and adapted to bear on the other end segment of the loop, and locking means for the outer end of said segment adapted to have movement therewith, substantially as and for the purpose set forth.

11. In a gripping device, a main supporting member, a gripping-loop on which said supporting member fulcrums, a link carried by said supporting member and bearing on the outer terminal segment of said loop at a point intermediate the ends of said segment, and a spring-actuated sliding member on said supporting member, carrying a pivoted dog engaging the outer end of said terminal segment.

12. A gripping device comprising a main supporting member, a link carried thereby, a gripping-loop having terminal segments adapted to hook upon the said supporting member and within said link, respectively, the segment engaging said link having a hooked extension, and a spring-actuated sliding member carried by said supporting member and adapted to engage the hook of said extension, substantially as and for the purpose set forth.

13. A gripping device comprising a segmental gripping-loop, a main supporting member adapted to fulcrum on one terminal segment thereof, a link carried by said supporting member and adapted to bear on the other terminal segment of the loop intermediate the ends of said segment, and pressure means in engagement with said link and the outer end of said last-mentioned terminal segment and adapted to maintain pressure on said link independent of the pressure exerted on said segment, substantially as and for the purpose set forth.

14. A gripping device comprising a gripping-loop, a main supporting member having a shifting fulcrum on one end of said loop, a bent link having a shifting fulcrum on said main support and a bearing-point on the other end of said loop, said fulcrums and bearing-point being moved toward alinement with each other during the application of wrenching power.

15. A gripping device comprising a gripping-loop, a main supporting member having a shifting fulcrum on one end of said loop, a bent link having a shifting fulcrum on said supporting member and pressing at a point on the other end of said loop in a direction to close the loop, said fulcrums and point having a tendency to approach alinement upon the application of wrenching force, whereby the crushing force on the pipe is diminished.

16. A gripping device comprising a gripping-loop, a main supporting member having a shiftable supporting engagement with one end of said loop, and a hooked or bent link having shiftable engagement with said main supporting member and bearing on and supporting the other end of the loop, the arrangement and proportion of the parts being such that a straight line drawn through the points of engagement between the link and the main supporting member and between the latter and the loop will pass between the axis of the loop or pipe and the point where the link bears on said loop.

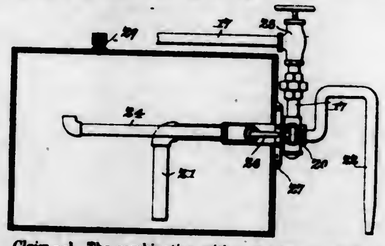
17. A gripping device comprising a gripping-loop, a main supporting member fulcrumed on one end of said loop, and a link fulcrumed on said main supporting member and bearing on the other end of said loop, the parts being so proportioned and arranged that a straight line extending through the fulcrum-points of said member and link will pass between the axis of the loop or pipe and the bearing-point of said link on the loop.

18. A gripping device comprising a gripping-loop, a lever fulcrumed on one end of said loop, a pair of lugs on said lever, a link bearing on and supporting the other end of said loop and having hooks engaging said lugs on the lever.

19. A gripping device comprising a gripping-loop, a main supporting member in the form of a lever having a shifting fulcrum on one end of said loop, and a link having a shifting fulcrum on said main support said link bearing on and supporting the other end of said loop.

20. A gripping device comprising a gripping-loop, a main supporting member engaging and supporting one end of said loop, and a hooked or bent link engaging a lug or lugs on the main supporting member and bearing on the other end of the loop.

12,439. **MEASURING APPLIANCE AND COMPRESSOR FOR LIQUIDS.** HENRY C. LEITCH, Marion, Wis., assignor, by mesne assignments, to Syphonic Measure Tank Company, Sheboygan, Wis., a Corporation of Wisconsin. Filed Mar. 20, 1905. Serial No. 251,174. Original No. 781,836, dated Jan. 31, 1905.



Claim.—1. The combination with a measuring vessel, of a siphon-discharge including two inlet-legs, one of which is adjustable with respect to the other.

2. The combination with a measuring vessel, of a siphon-discharge, including a fixed intake-leg, the mouth of which is arranged close to the bottom of a vessel, and a separate tube having one end pivotally connected to the siphon, and the other end adjustable to admit air to the siphon at different levels, the tube serving also as an additional intake-leg for said siphon.

3. In a measuring apparatus, the combination with a receptacle, of an intake-tube extending into the same and discharging near the bottom thereof, a discharge-tube communicating with said intake-tube and having its discharge end approximately below the plane of the liquid to be discharged, valve mechanism controlling said intake and discharge, and a siphon breaking and measuring tube pivoted to said intake-tube in a position for having its free end swung through the arc of a circle extending from the top to the bottom of said receptacle.

4. In a measuring apparatus, the combination with a receptacle, of an intake-tube extending therein and discharging near the bottom thereof, a branch tube extending from said intake-tube, a siphon-breaking tube communicating with and pivotally connected to said branch tube, said siphon-tube being adapted to swing upon its pivot through an arc of a circle extending from the top to the bottom of said receptacle, a discharge-tube communicating with the intake-tube and extending to a point below the plane of the liquid to be discharged and a valve mechanism controlling said intake and discharge.

5. In a measuring apparatus, the combination with a receptacle, of an intake-tube extending into the same, a pipe-fitting pivotally connected therewith, a rotatably-mounted shaft fixed to the free end of said pipe-fitting and extending through said receptacle, a siphon-breaking tube communicating with said pipe-fitting and designed to be swung vertically when said pipe-fitting is rotated, a discharge-tube communicating with said intake-tube and extending to a point below the plane of the liquid to be discharged and a valve mechanism controlling said intake and discharge.

DESIGNS.

37,790. **BROOCH OR SIMILAR ARTICLE.** JOSEPH H. CROSBY, Jacksonville, Fla., assignor to Gronniaf and Crosby Company, a Corporation of Florida. Filed Dec. 12, 1905. Serial No. 291,491. Term of patent 7 years.

37,790.

Claim.—The ornamental design for a brooch or similar article as shown.

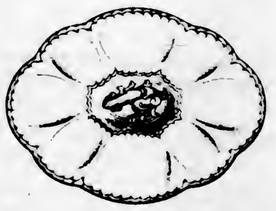
37,791. **HANDLE FOR SPOONS.** GEORGE P. IVES, Bridgeport, Conn., assignor to The R. H. H. Smith Silver Company, Bridgeport, Conn. Filed Dec. 6, 1905. Serial No. 290,630. Term of patent 7 years.

Claim.—The ornamental design for a handle for spoons, forks or similar articles as shown.

37,792. **COVER-DISH.** ROBERT LEWIS JOHNSON, Stoke-upon-Trent, England. Filed Dec. 26, 1905. Serial No. 292,417. Term of patent 3½ years.

Claim.—The ornamental design for a cover-dish, as shown.

37,793. **COVER-DISH.** ROBERT LEWIS JOHNSON, Stoke-upon-Trent, England. Filed Dec. 26, 1905. Serial No. 292,418. Term of patent 3½ years.



Claim.—The ornamental design for a cover-dish, as shown.

37,794. **PLATE.** CHARLES H. EIDELER, Limoges, France. Filed Dec. 16, 1905. Serial No. 292,379. Term of patent 3½ years.

Claim.—The ornamental design for a plate, as shown.

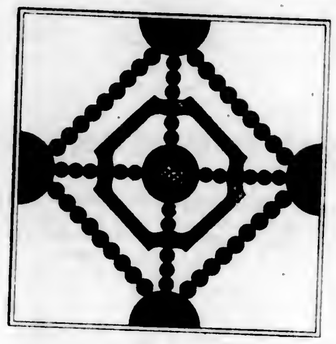
37,795. **CRUMB-TRAY.** MARGARET M. J. ROONEY, New York, N. Y. Filed Apr. 27, 1905. Serial No. 257,781. Term of patent 14 years.

37,796. **GAME-BOARD.** FREDERICK J. WOLF, Bucyrus, Ohio. Filed

87,795. CRUMB-TRAY. MARGARET M. J. ROONEY, New York, N. Y. Filed Apr. 27, 1905. Serial No. 257,781. Term of patent 14 years.

Claim.—The ornamental design for a crumb-tray, as shown.

87,796. GAME-BOARD. FREDERICK J. WOLF, Bucyrus, Ohio. Filed Jan. 3, 1905. Serial No. 238,943. Term of patent 7 years.



Claim.—The ornamental design for a game-board as shown.

TRADE-MARKS.

PUBLISHED JANUARY 23, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 283. WHISKY. SHORTELL & TIERNEY, Boston, Mass. Filed Apr. 3, 1905.

A monogram composed of the letters and character "S & T" inclosed in an ornamental circle and surrounded by scrollwork and ornamental panels, in connection with which are the words "KEENE'S ROCK MALT," arranged above said monogram.

SER. No. 376. AXES, HATCHETS, AND ADZES. THE COLLINS COMPANY, Collinsville, Conn. Filed Apr. 4, 1905.

The word "LEGITIMUS."

SER. No. 645. CORSET BONES OR STAYS. JULIUS JAEGGERS, New York, N. Y. Filed Apr. 6, 1905.

SER. No. 645.

WALOHN

The word "WALOHN."

SER. No. 677. BUTTER. THE FOX RIVER BUTTER COMPANY, Aurora, Ill. Filed Apr. 7, 1905.

A circle inclosing the words "FOX RIVER BUTTER CO.," and the words "CLOVER HILL BUTTER" arranged on a scroll extending in an arc with its ends joining the circle and the words "AURORA, ILL." below the scroll.

SER. No. 970. COUGH CURE. THE KICKAPOO INDIAN MEDICINE CO., Clintonville, Conn. Filed Apr. 10, 1905.

SER. No. 970.

Kickapoo

The word "KICKAPOO."

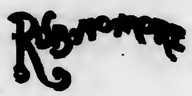
SER. No. 994. WHITE-STONE PINS, WHITE-STONE EARRINGS, AND WHITE-STONE STUDS. DONLEY & Co., Providence, R. I. Filed Apr. 10, 1905.

The representation of a bird in the act of flying and carrying in his bill a pennant on which are the letters "D & Co."

SER. No. 1,014. LEATHER BOOTS, SHOES, AND SLIPPERS. RINDGE, KALMBACH, LOGIE & Co., LT'D, Grand Rapids, Mich. Filed Apr. 10, 1905.

The letters, character, and abbreviation "R. K. L. & Co." on a red ground having the form of an irregular polygon having five sides, together with two right angles and three obtuse angles.

SER. No. 1,960. SOAP. THE SUMMIT CITY SOAP WORKS, Fort Wayne, Ind. Filed Apr. 17, 1905.

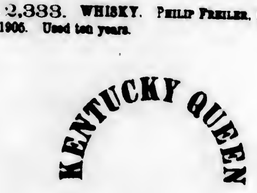


The arbitrary word-symbol "RUB-NO-MORE."

SER. No. 1,961. WASHING-POWDER. THE SUMMIT CITY SOAP WORKS, Fort Wayne, Ind. Filed Apr. 17, 1905.

The word-symbol "RUB-NO-MORE" arranged above a picture of an elephant dressed as a washerwoman with a hood upon its head, seated on a stool, holding a baby elephant over a tub, and spouting water over it with its trunk.

SER. No. 2,333. WHISKY. PHILIP FREILER, Elgin, Ill. Filed Apr. 20, 1905. Used ten years.



The words "KENTUCKY QUEEN."

SER. No. 2,847. WHEAT-FLOUR. PITTSBURGH MILLING Co., Allegheny, Pa. Filed Apr. 24, 1905. Used ten years.

CAMBRIA

The word "CAMBRIA."

SER. No. 2,900. COFFEE-GRINDERS. NATIONAL SPECIALTY MANUFACTURING COMPANY, Philadelphia, Pa. Filed Apr. 24, 1905.

The word "NATIONAL."

SER. No. 3,494. ALE. S. BOLTON'S SONS, Troy, N. Y. Filed Apr. 28 1905. Used ten years.

HOME BREWED

The words "HOME BREWER."

SER. No. 3,867. SOAP. DUNWOODY BROS. SOAP COMPANY Denver, Colo. Filed May 1, 1905.

The words "WATER WHITE" followed by the word "SOAP," so as to read "WATER WHITE SOAP," the "W" being sufficiently large to form the initial letter of both words "WATER" and "WHITE," associated with the script-written firm-name "DUNWOODY BROS.," said name ending in a paraph.

SER. No. 4,009. COFFEE. NEW ORLEANS COFFEE Co., LTD., New Orleans, La. Filed May 2, 1905.

SER. No. 4,009.

The word "CHIEF" and the bust of an Indian chief with full plume headdress.

SER. No. 4,234. UNDERSHIRTS AND DRAWERS FOR MEN AND WOMEN. HEILMANN, LOVE & GUTMAN, New York, N. Y. Filed May 2, 1905.

The representation of a dumb-bell.

SER. No. 4,648. POWDERED STOVE-POLISH. X-RAY STOVE POLISH Co., New York, N. Y. Filed May 8, 1905.

The representation of a stove with dancing devils on top and the words "X-RAY STOVE POLISH" on the side.

SER. No. 4,828. INSOLES. ELECTRIC APPLIANCE Co., Burlington, Kans. Filed May 9, 1905. Used ten years.

The pictorial representation of a foot upon an insole having overlapping disks thereon and the representation of a ring at the heel end of the insole.

SER. No. 4,928. SHEETINGS AND DRILLINGS. GREENDEL MILLS, Greenwood, S. C. Filed May 10, 1905.

The representation of two fighting Chinamen with shields and clubs inclosed within an ornamental border.

SER. No. 5,002. MICROBE-KILLER. IDA RADAM, New York, N. Y. Filed May 10, 1905.

The representation of a shield bearing the words "WM. RADAM'S MICROBE KILLER," and depicted upon the shield is a skeleton and a man wielding a club as if striking the skeleton. A broken scythe rests at the feet of the skeleton. The words "MICROBE KILLER" appear upon the club. Above the shield is a ring.

SER. No. 5,109. GERMICIDES AND REMEDIES FOR GERM AND SKIN DISEASES. THE RHUMA-SULPHUR Co., St. Louis, Mo. Filed May 11, 1905.

The pictorial representation of the devil standing erect with arms extended and with flames around his feet and legs, in connection with the words "LITTELL'S LIQUID SULPHUR."

SER. No. 5,218. GARDEN, FLOWER, AND FIELD SEEDS. THE LIVINGSTON SEED Co., Columbus, Ohio. Filed May 11, 1905.

The representation of a seal having a circular center, superimposed upon which is a diamond-shaped figure having thereon panels containing the words "LIVINGSTON'S TRUE BLUE SEEDS" and "THE LIVINGSTON SEED Co. COLUMBUS OHIO."

SER. No. 5,373. WHISKY. THE VACCARO CIGAR & LIQUOR Co., Memphis, Tenn. Filed May 12, 1905.

The words "HICKORY VALLEY," associated with a monogram composed of the letters "V Co."

SER. No. 5,628. MOLASSES. H. W. TARLTON Co., New York, N. Y. Filed May 15, 1905. Used ten years.

SER. No. 5,628.

The representation of an ornamental circle surrounded by the words, characters, and abbreviations "E & P SALAZAR & Co. PONCE, P. R." in a circle.

SER. No. 5,635. HATS. GAGE BROTHERS & COMPANY, Chicago, Ill. Filed May 15, 1905.

The representation of a shield having thereupon a monogram comprising the letters, character, and abbreviation "G B & Co." surrounded by a fanciful scroll design, and a scroll beneath the same having thereupon the words "OUR MARK."

SER. No. 5,664. MOLASSES. BOSTON MOLASSES CO., Boston, Mass. Filed May 15, 1905.

The representation of a crown in red surrounded by the words and abbreviations "JOSE VENDRELL Y CA PONCE, P. R." in a circle.

SER. No. 6,322. BITUMINOUS AND ANTHRACITE COAL. ECONOMY FUEL CO., Montgomery, W. Va., and Cincinnati, Ohio. Filed May 22, 1905.

"LINGO"

The word "LINGO" inclosed in quotation-marks.

SER. No. 6,323. BITUMINOUS AND ANTHRACITE COAL. ECONOMY FUEL CO., Montgomery, W. Va., and Cincinnati, Ohio. Filed May 22, 1905.

"ECONOMY"

The word "ECONOMY" inclosed in quotation-marks.

SER. No. 6,540. CAR-COUPLINGS, CAR-BUFFERS, DRAFT-GEARS, AND PARTS THEREOF. GOULD COUPLER CO., New York, N. Y. Filed May 24, 1905. Used ten years.

GOULD

The word "GOULD."

SER. No. 6,703. MUCILAGE, PASTE, AND ADHESIVE CEMENTS. THE CARTER'S INK COMPANY, Boston, Mass. Filed May 26, 1905. Used ten years.

CARTER'S

The word "CARTER'S."

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

W. A. GAINES AND COMPANY v. C. A. KNECHT AND SON.

Decided December 18, 1905.

1. TRADE-MARKS—LACK OF IDENTITY—"RAVEN VALLEY" AND "OLD CROW."

Registration of a mark consisting of the words "Raven Valley" and the representation of three ravens is not to be refused because of the prior use by another of the words "Old Crow" and the picture of a crow. The marks are not so nearly alike as to deceive purchasers.

2 SAME—OPPOSITION—SUFFICIENCY OF ANSWER.

Where opposition is made to the registration of a trade-mark and the applicant is called upon to make answer within a certain time and he does within that time file a paper entitled a demurrer, setting forth reasons which the Office regards as sufficient for dismissing the opposition, *Held* that he has complied with the Office requirement for an answer.

3. SAME—SAME—PLEADINGS—TECHNICAL FORMS NOT INSISTED UPON.

Technical and refined objections to the form of pleadings in trade-mark oppositions will not be sustained. It is sufficient if the parties present to the Office the material which will enable it to properly dispose of the case on its merits, and it is not necessary to insist upon technical forms.

4. SAME—CONSTITUTIONALITY OF ACT OF 1905—MATTER FOR COURTS.

The question whether the Trade-Mark Act of February 20, 1905, is unconstitutional will not be entertained or determined by the Patent Office, but will be left for determination by the courts. The Office will perform the duties imposed by the act, leaving to the courts the question as to the validity of the registrations made thereunder.

APPEAL from Examiner of Interferences.

TRADE-MARK FOR WHISKY.

Mr. James L. Hopkins and *Mr. John S. Barker* for W. A. Gaines and Company.

Mr. Arthur E. Wallace for C. A. Knecht and Son.

ALLEN, *Commissioner:*

This is an appeal by W. A. Gaines and Company from the decision of the Examiner of Trade-Marks dismissing their opposition to the registration of the trade-mark claimed by C. A. Knecht and Son.

The opposition was based upon the allegation that W. A. Gaines and Company are the owners of a trade-mark so nearly resembling the applicants' mark that the latter would deceive the public and mislead purchasers. On June 28 the applicants were called upon to file an answer to the notice of opposition on or before July 28, 1905. On July 24 the applicants filed a paper entitled a demurrer, alleging that the notice of opposition sets forth no sufficient reasons for refusing their application for registration. The Examiner of Interferences sustained this contention and entered judgment dismissing the opposition. W. A. Gaines and Company thereupon filed this appeal.

In support of the appeal it is urged, first, that judgment should have been entered in favor of W. A. Gaines and Company because of the applicants' failure to answer and that in the absence of an answer the demurrer should have been stricken from the files; second, that the Trade-Mark Act under which the applicants C. A. Knecht and Son seek registration is unconstitutional and void; third, that the Examiner was wrong in sustaining the demurrer on the ground that the marks claimed by the respective parties are not substantially the same.

In regard to the first question, it is to be noted that the applicants did file a paper in answer to the opposition within the time fixed by this Office and in that paper set forth reasons why the opposition should be dismissed. The Examiner's letter calling for an answer was merely a requirement that the applicants show reasons, if any existed, why the opposition should not be sustained and registration refused. The applicants were entitled to rely upon any matters of defense, whether of law or of fact. They did rely upon the defense that the notice on its face set forth no sufficient grounds for refusing registration, and the Examiner found this defense to be well founded. The first objection made by the appellants to that answer is entirely technical and without substantial merit. There is no necessity for such refinement of pleading as is implied in that objection. It is sufficient if the parties present to this Office the material which will enable it to make proper disposition of the case upon its merits, and it is unnecessary to insist upon technical forms of procedure.

In regard to the second question, it is not believed that this Office would be justified in refusing to register a trade-mark as directed by the act of Congress dated February 20, 1905, even if it were to conclude that marks registered under that act were of no legal effect and void. After this Office has concluded that the applicant is the owner of the trade-mark disclosed in his application and that it is not one of those marks the registration of which is prohibited it becomes the ministerial duty of the Office to register the mark under the act of February 20, 1905. Such registration does not create a property right in the applicant nor take away the property right of another, but is a mere record of the applicant's claim of title. The real right of the applicant is subject to investigation and determination in suits brought in the courts subsequently, either by or against him. The question whether that registration constitutes *prima facie* evidence of ownership may call for a determination as to the constitutionality of the law providing for registration. It is believed that this

Office should leave the determination of this question to the courts in the regular way.

The Supreme Court of the District of Columbia in the case of *Schumacher* v. *Marble* (3 Mackey, 32) said:

> We do not think it lies in the mouth of a Government official to call in question the constitutionality of a law directing him to perform a purely ministerial duty. If the question was raised between other parties, as for instance, in a suit for infringement in the use of a label, and the constitutional rights of the parties were involved in it, that is to say whether one man was prohibited from using it because another man had registered it as a label, the argument might be pertinent, but we do not think it is a question which can be raised here.

It is clear that the decision of the Examiner of Interferences must be sustained, unless he was wrong in holding that the marks of the two parties to this proceeding are not so clearly alike as to deceive purchasers. The marks are used on the same class of goods, and therefore the question of conflict is upon the similarity of the marks themselves.

It appears that the applicants C. A. Knecht and Son used as their trade-mark the words "Raven Valley," together with the representation of three birds, said to be ravens, perched upon the branches of a tree.

The ground of opposition stated in the notice is as follows:

> W. A. Gaines & Company is the sole and exclusive owner of the trade-mark for whisky consisting of the words "Old Crow."

It is also said in the notice of opposition that—

> * * * the whisky is sold by W. A. Gaines & Company both in glass and in bulk, and when sold in bulk, the whisky is frequently bottled by the customers of W. A. Gaines & Company, under labels bearing the brand "Old Crow" accompanied by the picture of a crow, and the following are specimens of such customers' labels which have been in common use among the trade for upward of thirty-five years last past.

No such similarity between the words "Old Crow" and the applicants' mark appears as would seem likely to mislead the public or deceive purchasers. The fact that the raven belongs to the same family as the crow is not a sufficient reason for concluding purchasers would be deceived and mistake one mark for the other. On the contrary, the words "Old Crow" are so distinctive that it is not believed that there would be any confusion even where the representation of a crow is used with the words, as shown in the specimens filed with the notice of opposition. There is no such similarity in the words or in the pictures as to warrant this Office in refusing to register the applicants' mark.

The decision of the Examiner of Interferences dismissing the opposition is affirmed.

AUTENRIETH AND KANE *v.* SORENSEN.

Decided December 22, 1905.

INTERFERENCE—REOPENING A SECOND TIME—REFUSED.

Where the testimony in an interference refers to a certain exhibit which is not introduced in evidence, although its whereabouts is known, and the interference is reopened for the purpose of taking an additional deposition to properly connect such exhibit with the original testimony, the interference will not be reopened a second time because of the insufficiency of such deposition.

APPEAL on motion.

SNAP-SWITCH.

Mr. Vernon E. Hodges for Autenrieth and Kane.

Messrs. Townsend & Decker and *Mr. J. R. Edson* for Sorensen.

ALLEN, *Commissioner:*

This is an appeal by Autenrieth and Kane from a decision of the Examiner of Interferences denying a motion to reopen the case for taking further testimony.

It appears from the verified statements of counsel for appellants that on the day preceding the time set for taking testimony after a conference with his clients a telegram was sent to his office at Washington directing that certain models "probably in Patent Office" should be sent immediately to New York and that in reply thereto counsel's clerk telegraphed that the models had been returned May 13, 1904. On the succeeding day testimony was taken, in which testimony one of the joint inventors stated that he had made one device and that he believed such device was on file in the Patent Office. At this point counsel stated on the record that the device to which the witness had just referred was used by him at the hearing of an appeal to the Commissioner some time previously in opposing a motion to dissolve and to the best of his knowledge was at that time in the Patent Office or in his office in Washington.

The testimony was completed without the introduction into evidence of the device or devices referred to by the witnesses. The case came on for final hearing before the Examiner of Interferences, at which time it was discovered that the device referred to by the witnesses and which was relied upon as a reduction to practice had not been properly introduced in evidence. The Examiner of Interferences thereupon reopened the case for the purpose of taking the attorney's deposition in order that he might identify the exhibit which had been on file in the Patent Office as the one referred to in the depositions already taken. Such deposition was thereafter duly taken and filed.

The Examiner of Interferences then rendered his decision on the question of priority. In such decision it was held that the deposition of the attorney was not original evidence and that it was insufficient to establish that the exhibit to which his testimony referred was the identical one referred to by the other witnesses in their testimony, and it was held that the onus of proof had not been discharged, and for this reason priority was awarded to the opposing party, Sorensen, on his record date.

A motion to reopen the case for taking further testimony for the purpose of connecting the exhibits in question with the original testimony was denied by the Examiner of Interferences, and this appeal was taken.

The steps in the proceedings have been set forth somewhat at length for the purpose of clearly showing that appellants are not entitled to the relief which they seek. In the first place the necessity of placing in evidence the device which is said to be the only device ever made was recognized before any testimony was taken. Notwithstanding this, the testimony was taken and filed without any effort to produce the exhibit other than the request sent to the attorney's office in Washington asking that certain models be sent to New York. The reply which was received was known to be incorrect, and yet no effort was made to determine where the devices referred to were. It is not a sufficient excuse to say that although the necessity for securing the model or exhibit was recognized before testimony was taken the time for taking testimony had been set and that appellant was therefore compelled to take testimony without such exhibit. Appellants allege that the exhibit in question was used in the Office at the hearing on a motion to dissolve as early as March 22, 1904, more than two months before the taking of their testimony. Appellants therefore not only knew of the existence of the

exhibit long before the time set for taking testimony, but they knew substantially where it was both before the taking of their testimony and also during the six days of the time allowed them remaining after their testimony was actually taken. It is therefore clear that there was ample time in which to procure the exhibit and that there was nothing to prevent appellants from procuring it except their lack of diligence.

Although appellants were negligent in taking their testimony, the Examiner of Interferences reopened the case and permitted the taking of an additional deposition for the purpose of correcting the failure to introduce and identify the exhibit; but the Examiner of Interferences held that the additional deposition did not properly connect the exhibit referred to therein with the testimony of the prior witnesses. Counsel for appellants states that at the time the case was reopened one of the joint inventors, Autenrieth, who referred in his testimony to the exhibit in question, was in the city of Washington and that it was proposed to take the deposition of counsel or of Autenrieth, as the Examiner of Interferences deemed best, to which the Examiner replied that the deposition of one would be as acceptable as the other; but it cannot be determined precisely what conversation occurred, nor is it deemed necessary to do so. It seems obvious that the Examiner of Interferences could not attempt to state which of two parties had the proper knowledge to establish a certain point. It was for the party or his counsel to determine what witness or witnesses would be able to establish the facts which it was desired to prove.

If the proper facts were not within the knowledge of counsel for appellants, he should have made this clear to the Examiner of Interferences and requested that the deposition of his client, rather than of himself, should be taken.

It is a well-settled rule that cases will not be reopened merely because a party has through mistake or ignorance failed to present his best evidence, and that rule is applicable in this case. The opposing party may have relied upon what he considered the failure of appellants to overcome his *prima facie* case, and if the proceedings were now reopened it might be necessary for him to take testimony which otherwise would have been unnecessary. There must be an end somewhere to interference proceedings, and it is believed that appellants have had ample opportunity to prove their case, and if they have not done so they have no just cause for complaint.

The decision of the Examiner of Interferences is affirmed.

GORDON *v.* WENTWORTH.

Decided December 26, 1905.

INTERFERENCE—BROAD ISSUE—INTERFERENCE IN FACT.

Where the claims of interfering parties are in identical language and each party has a construction responding in function to the broad terms thereof, there is an interference in fact, although the constructions are specifically different.

APPEAL on motion.

HEEL-SEAT BEADER AND FINISHER.

Messrs. Phillips, Van Everen & Fish for Gordon.

Messrs. Wood & Wood for Wentworth.

ALLEN, *Commissioner:*

This is an appeal by Wentworth from a decision of the Primary Examiner refusing to dissolve the interference on the ground that there is no interference in fact.

The claims of the issue are claims made by each party in identical language. It is contended by appellant that the words of the several counts, "two series of rotating beaters" and "means for actuating said beaters," do not mean the same thing when applied to the constructions of the respective parties; but upon an examination of this question it is found that both parties have "two series of rotating beaters" which perform the same function in each case—that is, the function of pressing the lower edge of the upper closely against the surface of the insole. Furthermore, each party has means for "actuating said beaters." It is true that the rotating beaters and the means for actuating the same are different in the two cases, but both are comprehended within the broad terms used in the issue. As stated in prior decisions, where the claims of the interfering parties are in identical language there is an interference in fact, although there may be specific differences in the two constructions, such specific differences not being specified in the claims. This case does not come within those exceptional cases mentioned in the decisions where the same terms are properly applied to constructions which are essentially different in function and operation.

The decision of the Primary Examiner is affirmed.

EX PARTE THE KINGAN PACKING ASSOCIATION.

Decided December 29, 1905.

1. TRADE-MARKS—PARTICULAR DESCRIPTION OF GOODS—STATUTORY REQUIREMENT.

The statute requires that the applicant specify the particular goods upon which his mark has been used and not merely the class of goods. The term "meats" gives the class, but not the particular goods, and is not sufficiently definite.

2. SAME—DIVISION—GOODS OF THE SAME DESCRIPTIVE PROPERTIES.

Only one trade-mark right should be covered by a single registration, and where the statement of the goods to which the mark has been applied is so broad as to include goods which are not of substantially the same descriptive properties registration will be refused.

ON APPEAL.

TRADE-MARK FOR MEATS AND LARD.

Messrs. Bradford & Hood for the appellant.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register a trade-mark said to have been used upon "meats and lard."

The grounds of refusal are, first, that the appellant has not complied with the statutory requirement that he shall include in his application "the particular description of goods * * * to which the trade-mark is appropriated," and, second, that the general and indefinite terms used are broad enough to include goods so different in descriptive properties that the use of a single mark upon them would constitute different trade-mark rights.

Section 1 of the act of 1905 says that the application shall specify—

> the class of merchandise and the particular description of goods comprised in such class to which the trade-mark is appropriated.

In the present case the class of goods is said to be "foods and relishes," and the particular description of goods within the class is "meats and lard." While the term "lard" is sufficiently specific, it is clear that the term "meats" is not. It is a statement of a class of goods and not a statement of the particular goods, as required by the

statute. It is not of consequence that the term "meats" comes within the broader class of "foods and relishes," nor that it comes within the class, mentioned in the brief, "animal products used for human food." The test is not whether there is some broader term which may be used to indicate a class which is still broader in scope and includes the class mentioned, but is whether the terms used are sufficiently definite to inform the public just what use of the mark has been made. The appellant has not said that he has used the mark upon all kinds of articles which come within the class of meats, and the statute contemplates that he shall state clearly the specific use which he has made of his mark, so that the public may determine the scope of his right.

The present application is too indefinite to make it possible to determine just what right the appellant has acquired by actual use. As pointed out by the Examiner, however, if he is seeking to claim the right to use the mark upon any and all articles coming within the meaning of the broad term "meats" he is seeking to secure by one registration more than one trade-mark right. This is not permissible.

The appellant should specify the particular goods upon which the mark has been used and should limit the application to such as are of substantially the same descriptive properties.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE WIXFORD.

Decided January 8, 1906.

ACCESS TO PENDING APPLICATION.

Where a patent is granted containing the statement that it is a continuation *in part* of a prior application, access to such prior application will not be granted to strangers without a proper showing of interest and without giving the applicant an opportunity to oppose such action, particularly where such prior application is still pending, and it appears that its subject-matter is not identical with that of the patent.

ON PETITION.

PROCESS OF PURIFYING WATER.

Messrs. Carr & Carr for the applicant.

Messrs. Bakewell & Byrnes for the petitioner.

ALLEN, *Commissioner:*

This is a petition for access to a pending case which is referred to in the record of Patent No. 807,008, granted to J. F. Wixford December 12, 1905.

The patent states that it is a continuation in part of the pending application, to which it refers by serial number.

The record of the patent contains the following statement:

In a recent oral interview, it appeared that the Acting Examiner who made the official action in the present case was not familiar with the proceedings in the earlier application, in which practically all of the references now cited were fully considered and withdrawn.

It is contended that the claims of the patent were allowed for reasons which appear only in the pending application, as shown by the language above quoted, and that access to this pending application is desired to determine what these reasons were.

Petitioner has made no showing of interest, and he must therefore be treated as one of the general public.

It was stated in a prior decision *ex parte Dorman*, 115 (O. G., 804) that where a patent is granted on an application which is a continuation of a prior application and the prior application is subsequently abandoned the abandoned application is, in fact, a part of the proceedings which led to the grant of the patent, and to it the rule of secrecy no longer applies.

But the case here presented is not the same. The prior application is not abandoned. Furthermore, the application on which the patent was granted was not on its face a continuation of the prior application, since it purported to be only a continuation "in part," and it requires but a superficial examination to determine that the subject-matter claimed in the two cases is not identical. The application may cover an invention which is divisible from the subject-matter claimed in the patent, and the applicant should be permitted to preserve that part in secrecy, even if inspection of the part relating to the subject-matter of the patent is permitted. For this Office to undertake to determine what parts of the proceedings in the application relate to the subject-matter of the patent without a hearing to the patentee might result in the disclosure of matter which should be preserved in secrecy.

Where, as here, it appears that the application may include matter which the patentee is entitled to conceal, access to the application should not be granted until the patentee has been given notice of the request for access and an opportunity to show why the request should not be granted.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

IN RE THURSTON.

Decided December 5, 1905.

1. PATENTABILITY—DOUBLE USE—SUBSTITUTION OF EQUIVALENTS.

Where in a rock-crusher a mantle removably secured upon a conical core is concededly unpatentable, *Held* that the provision of old pin-and-slot fastening devices for retaining the mantle tightly upon the conical core is mere double use and, in view of certain references, an obvious substitution of equivalents.

2. SAME—SAME—SAME—POTTS *v.* CREAGER.

In denying patentability to a change in prior devices, *Held* that the change was not made by transferring an old device to use in an entirely different and unrelated art and that therefore the case of *Potts* v. *Creager* (155 U. S., 597) does not apply.

3. SAME—POPULARITY—LARGE SALES.

Where the assertion was made that the new machine had met with instant favor and large sales, but there was nothing in the record to bear out the assertion, *Held* that no effect could be given thereto.

Mr. T. F. Sheridan, *Mr. C. F. Fitts*, and *Mr. G. F. De Wein* for the appellant.

Mr. John M. Coit for the Commissioner of Patents.

SHEPARD, *J.:*

The appellant has appealed from a decision of the Commissioner of Patents rejecting all of the claims of his application. These read as follows:

1. In a rock and ore breaker, the combination of a crusher-shaft, a core portion removably secured thereto, and a mantle portion removably secured to the core portion, substantially as described.

2. In a rock and ore breaker, the combination of a crusher-shaft, a core portion removably secured to the crusher-shaft and having an outer tapered periphery, and a mantle of chilled iron made in the shape of a truncated cone removably secured to the core portion, substantially as described.

3. In a rock and ore breaker, the combination of a crusher-shaft, a sleeve-shaped core grooved on its inner bore, key mechanism in the grooves of said core for removably holding the core in position, and a chilled cast-iron mantle made in the shape of a truncated cone removably secured to the core, substantially as described.

4. In a rock and ore breaker, the combination of a crusher-shaft provided with longitudinal grooves, a core portion formed in the shape of a truncated cone and having a longitudinally-grooved bore, key mechanism for removably securing the core portion to the crusher-shaft, a mantle portion formed of chilled metal, one of such portions having a vertical groove with inclined walls at its lower portion and the other a lug to engage such grooves, and its inclined walls to removably hold the mantle in position, substantially as described.

5. In a rock and ore breaker, the combination of a crusher-shaft, a core made in the shape of a truncated cone having a central bore to fit the crusher-shaft and locking-grooves on its outer surface, the lower walls of which are inclined in opposite directions, and a crusher-mantle formed of chilled metal and made in the shape of a truncated cone provided with a lug or projection to engage the locking-groove of the core portion so as to be removably held in position, substantially as described.

In his brief the appellant admits that claims 1, 2, and 3 were properly rejected, and confines his appeal to claims 4 and 5.

The decisions of the tribunals of the Patent Office fully and fairly discuss each of the claims originally contended for, in the light of the various references showing the state of the prior art, and further discussion by us would serve no useful purpose. We fully concur in the following extract from the Commissioner's decision:

Claims 4 and 5 involve, in addition to the questions disposed of in connection with claim 1, the patentability of the structure set forth in claim 1 when provided with the specific pin-and-slot fastening devices of the Capen patent for retaining the mantle tightly upon the conical surface of the core. The application of the Capen fastening means to the mantle and core of the applicant's machine is, so far as I am able to perceive, mere double use, and, in view of Hadfield and McCulley, 566,464, is also an obvious substitution of substantial equivalents.

In antagonizing this view, the appellant contends that he has made a change which amounts to something more than a substitution of the Capen device; a change which, though slight, has been followed by new and most useful results. These results are not apparent. Moreover, the change is not made as in *Potts* v. *Creager* (155 U. S., 597), upon which the appellant relies, by transferring an old device to use in an entirely different and unrelated art; nor is there anything in the record to bear out the assertion that the new crushing-machine "has met with instant favor and large sales." Such a fact, if proved, has often been held to determine patentability in case of doubt thereof, otherwise existing. We are advised of no case going any farther than that. (See *Durham* v. *Seymour*, 6 App. D. C., 78, 92, and cases cited.)

The decision of the Commissioner of Patents will be affirmed, and the proceedings herein certified to him. It is so ordered.

Court of Appeals of the District of Columbia.

IN RE SCHRAUBSTADTER.

Decided December 5, 1905.

1. PATENTABILITY—RULES AS TO DOUBTS.

Where there is a serious doubt as to patentability, that doubt should be resolved in favor of the one seeking a patent, for if his claim be denied he has nothing with which he can go into court and attempt to enforce a lawful monopoly; but in reversing the concurrent decisions of the Patent Office there should be conviction beyond a reasonable doubt that in the absence of anything but what is shown by the record a patent granted on the application would be held a valid one.

2. DESIGN—FONT OF TYPE—ILLUSTRATION.

Where criticism was made that the type were not shown, but only the kind of printed matter produced, *Held* that the answer thereto is that the conventional drawing accepted by the Patent Office for years has been furnished and that the absence of description is authorized by the Patent Office rules.

3. SAME—PATENTABILITY—INVENTION.

Where small differences existed in the applicant's design over the references, which differences would appear greater to an expert than to the average observer, *Held*, nevertheless, that the design was not patentable, because the differences did not rise to the dignity of invention.

4. SAME—SAME—SAME.

Where peculiarities in the applicant's design were such as to prevent that design from being regarded in the trade as a substitute for the design shown by the references, *Held* that the applicant's design was nevertheless not patentable, because such peculiarities did not rise to the dignity of invention.

5. SAME—SAME—EFFECT ON AVERAGE OBSERVER—ARTISTS AND EXPERTS.

Held that the conclusion of the Court in *Gorham Co.* v. *White* (14 Wall., 511) was that the novelty of a design was to be determined and infringement decided by the comparative appearance of the designs in the eyes of average observers and was not to be determined by such appearance to the eyes of experts.

6. SAME—SAME—SAME—SAME.

Where contention was made that it is impracticable for the Patent Office to pass on esthetic values and that the proper estimation of the applicant's design required cultivated taste, *Held* that the statutes as construed by the courts intend that the patentability of designs shall be determined by their appeal to the eye of the ordinary man.

7. SAME—SAME—FONT OF TYPE.

Where the applicant's design was for a font of type in which the letters had a waved outline, *Held* that aside from the waved outline the letters seemed to be of a very ordinary style and that to add a waved outline, which was old, to common forms of letters did not involve invention.

Mr. James A. Carr and *Mr. H. H. Simms* for the appellant.

Mr. John M. Coit for the Commissioner of Patents.

DUELL, *J:*

The Commissioner of Patents refused to grant the appellant a design patent for his alleged improvements for a font of type, and from such decision this appeal was taken. The record discloses that his claim was fully considered by the various tribunals of the Patent Office, and that his counsel most carefully and ably presented the arguments in favor of the patentable novelty of the design. Not only were the usual hearings had, but it appears that a rehearing was asked and granted. It appears that in the decision of the Commissioner on the rehearing certain alleged prior patents, not before referred to, were cited by the Commissioner, some of which do not belong to the prior art. These we have disregarded in the consideration of the appeal.

Some criticism is made in appellee's brief that appellant has not shown or described the type themselves, but has only shown the kind of printed matter produced by the type. The answer to this is that appellant has furnished the conventional drawing accepted for years by the Patent Office, save that he has shown modifications of lower-case letters "f" and "t." This the Examiners-in-Chief held he had the right to do, and the correctness of the ruling was not questioned by the Commissioner. Furthermore the absence of any description of the design is authorized by the Patent Office rules relating to designs.

As we view it the real question before us is whether the claimed design, in view of the prior art, discloses patentable invention. In all cases where that question is presented to this court, or to the Federal courts in infringement suits, it is unwise to generalize for the facts in such case must govern the conclusion reached and often it is difficult to differentiate between patentable and non-patentable invention. Where there is a serious doubt left in

the mind of this court we believe that that doubt should be resolved in favor of the one seeking a patent, for if his claim be denied he has nothing with which he can go into court and attempt to enforce a lawful monopoly. We should however in reversing the concurrent decisions of the Patent Office be convinced beyond a reasonable doubt, that, in the absence of anything but what is shown by the record in the case before us, we would hold a patent granted on the application to be a valid one.

In the case at bar there is not left, after a careful examination of the record and of the briefs of counsel, any serious doubt as to the non-patentability of the alleged design in view of the disclosure of the prior art. To arrive at this conclusion it is unnecessary, in our opinion to consider any of the prior patents save the design patents for fonts of type granted to Ihlenburg, November 12, 1895, No. 24,896, and to MacDonall, July 11, 1899, No. 31,215. We may and do freely admit the assertion of appellant's counsel that there are differences between the designs, but these differences, to the average observer, are small. To an expert they are undoubtedly greater and it is probably true, as set forth in the affidavit of Mr. Nelson, that the type sought to be protected by the appellant have individual peculiarities which would prevent them from being regarded by the printing trade as a substitute for the type of the patented designs. But such slight differences and peculiarities do not rise to the dignity of invention and do not warrant a grant of a patent to this appellant. Viewing the relations between these designs—the patented and the unpatented—we would do violence to the law as laid down by the Supreme Court were we to reverse the Commissioner of Patents. In *Gorham Co.* v. *White* (14 Wall., 511) the true test of identity of designs was laid down and has been followed by that Court to the present time. Said the Court:

> Plainly, it must be the sameness of appearance, and mere difference of lines in the drawing or sketch, a greater or smaller number of lines, or slight variances in configuration, if insufficient to change the effect upon the eye, will not destroy the substantial identity. * * * So a pattern for a carpet, or a print may be made up of wreaths of flowers arranged in a particular manner. Another carpet may have similar wreaths, arranged in a like manner, so that none but very acute observers could detect a difference. Yet in the wreaths upon one there may be fewer flowers, and the wreaths may be placed at wider distances from each other. Surely in such a case the designs are alike.

The conclusion of the Court was that the novelty of a design was to be determined, and infringement decided, by the comparative appearance of the designs in the eyes of average observers, and was not to be determined by such appearance to the eyes of experts. The Court said:

> We hold, therefore, that if in the eye of the ordinary observer, giving such attention as a purchaser usually gives, two designs are substantially the same, if the resemblance is such as to deceive such an observer, inducing him to purchase one supposing it to be the other, the first one patented is infringed by the other.

But in determining the question of the patentability of the later design it is not necessary to find that it infringes the earlier one in order to come to the conclusion that the later one lacks patentability, for invention is required in the production of a patentable design. (*Smith* v. *Whitman Saddle Co.*, 148 U. S., 674.) In *Northrop* v. *Adams* (12 O. G., 430) Mr. Justice Brown, then District Judge for the Eastern District of Michigan, in stating that the law applicable to design patents does not materially differ from the law relating to mechanical patents, said:

> To entitle a party to the benefit of the act, in either case, there must be originality, and the exercise of the inventive faculty.

Where, in cases like the one now before us, we arrive at the same conclusion as have the various tribunals of the Patent Office it serves no good purpose to elaborate the same reasons and restate the same facts. It is sufficient to set forth that we agree with them in their conclusion that the alleged invention is not deemed worthy of protection by patent. This is doubly so when we arrive at the same conclusion for reasons substantially the same as those advanced by them. Suffice it to say that we agree with the Commissioner that "aside from the waved outline, the applicant's letters seem to be of a very ordinary style." To add this old waved outline to common forms of letters does not, we believe, amount to invention. Given the prior Ihlenburg and MacDonall patented designs it did not require the exercise of the inventive faculty to produce appellant's design.

On the consideration of this appeal we have not lost sight of appellant's contention that it is impracticable for the Patent Office tribunals to pass judgment on esthetic values. We need not take issue with him upon the statement that "the proper esthetic estimation of a new type design, therefore, requires *taste*, the sense of the beautiful not in its merely natural state but highly cultivated and developed in delicacy and correctness under the guidance of reason." The answer to this is that Congress in enacting the patent statutes, relating as well to designs as to mechanisms, was not establishing a school of fine arts and did not provide for juries of artists, or artistic experts, to pass upon the questions of originality and invention. It was a condition and not a theory that confronted Congress, and the courts in construing design patents, both in reference to invention and infringement, have not adopted the high standard which appellant insists to be the proper one in determining whether the design produces a new and pleasing impression on the esthetic sense. The eye to which the design is to appeal is that of the ordinary man and not the eye of the artist. We may deplore the fact that Congress has not seen fit to provide a system for the grant of design patents which leaves the question of patentability to juries of artists, and that the courts in construing such patents and passing upon the questions of originality and infringement have not held that the appearance of the various designs was to be tested by the artistic eye, still we doubt the practicability of such a system. However this may be we must, while the Design Act reads as it does, and is construed as it has been by the court of last resort, follow such construction, and when we do we find no sufficient reason shown to warrant a reversal of the decision of the Commissioner of Patents, and his decision therefore should be, and is affirmed. The clerk of the court will certify this opinion and the proceedings of the court in this cause to the Commissioner of Patents according to law. Affirmed.

Disclaimer.

792,307.—*Anson Gardner Betts*, TROY, N.Y. PROCESS OF ELECTRO-DEPOSITING ANTIMONY. Patent dated June 13, 1905. Disclaimer filed January 24, 1906, by the patentee.

Enters his disclaimer—

"To claim 1, which reads as follows, to wit:

"1. The process of electrodepositing antimony which consists in electrolyzing a solution containing antimony trifluorid with a suitable cathode."

Drawings.

RULE 38.

38. When there are drawings the description will refer to the different views by figures and to the different parts by letters or numerals (preferably the latter).

RULE 52—EXTRACT.

(6) The different views should be consecutively numbered. Letters and figures of reference must be carefully formed. They should, if possible, measure at least one-eighth of an inch in height, so that they may bear reduction to one twenty-fourth of an inch; and they may be much larger when there is sufficient room. They must be so placed in the close and complex parts of drawings as not to interfere with a thorough comprehension of the same, and therefore should rarely cross or mingle with the lines. When necessarily grouped around a certain part, they should be placed at a little distance, where there is available space, and connected by short broken lines with the parts to which they refer. They must never appear upon shaded surfaces, and when it is difficult to avoid this, a blank space must be left in the shading where the letter occurs, so that it shall appear perfectly distinct and separate from the work. If the same part of an invention appear in more than one view of the drawing it must always be represented by the same character, and the same character must never be used to designate different parts.

It is suggested that numerals or letters be used without exponents.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business January 23, 1906.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	Under one month.			
308	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Jan. 16	Nov. 20	347
154	XI. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Jan. 15	Aug. 24	346
322	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Jan. 10	Dec. 19	240
378	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Jan. 10	Nov. 18	357
332	X. Carriages and Wagons	Jan. 10	Sept. 21	775
148	XXXII. Carbonating Beverages, Dispensing Beverages, Dispensing-Cans, Metallic Shipping and Storing Vessels, Packaging Liquids, Paper Receptacles, Refrigeration, Wooden Receptacles.	Jan. 10	Sept. 13	615
178	III. Annealing and Tempering, Coating with Metal, Electrochemistry, Metal-Founding, Metallurgy, Shaping Fluid Metal.	Jan. 9	Dec. 16	246
344	XXXV. Baggage, Buckles, Buttons, and Clasps, Card, Picture, and Sign Exhibiting, Deposit and Collection Receptacles, Package and Article Carriers, Packing and Storing Vessels, Photography.	Jan. 9	Nov. 2	558
303	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Jan. 9	Oct. 23	354
221	I. Tillage, etc., Fences, and Railway Draft Appliances.	Jan. 8	Dec. 12	206
144	XXIV. Apparel, Apparel Apparatus, Sewing-Machines, Surgery, Toilet.	Jan. 6	Oct. 3	498
379	XXIII. Acoustics, Coin-Handling, Horology, Recorders, Registers, Optics, Signals, Time Controlling Mechanism.	Jan. 6	Sept. 7	627
133	XXII. Air-Guns, Ammunition and Explosive Devices, Boats and Buoys, Catapults and Targets, Firearms, Marine Propulsion, Ordnance, Ships.	Jan. 5	Oct. 9	258
106	XXVI. Electricity, Generation, Electric Heaters, Electric Railways, Motive Power.	Jan. 5	July 10	705
107	XXXVII. Electricity, Conductors, Lighting, Special Apparatus.	Jan. 5	May 1	707
128	II. Bee Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Jan. 4	Oct. 23	245
188	XXX. Fluid-Pressure Regulators, Lamps and Gas-Fittings, Type-Writing Machines.	Jan. 4	May 11	610
304	XXXIV. Railways, Railway-Brakes, Rolling-Stock.	Jan. 2	Dec. 7	364
172	XXXI. Alcohol, Charcoal and Coke, Distillation, Gas, Heating and Illuminating, Hides, Skins, and Leather, Liquid Coating Compositions, Oils, Fats, and Glue, Water Purification.	Jan. 2	Dec. 2	248
316	VI. Bleaching and Dyeing, Chemicals, Explosives, Fertilizers, Medicines, Preserving, Sugar and Salt.	Jan. 2	Nov. 1	339
397	XVIII. Steam-Engineering, etc	Dec. 29	Oct. 16	342
127	VIII. Beds, Chairs, Furniture, Kitchen and Table Articles, Store Furniture.	Dec. 28	Sept. 16	539

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
307	XIV. Cutting and Punching Sheets and Bars, Farriery, Metal-Bending, Metal-Ornamenting, Metal Personal Wear, Making, Sheet-Metal Ware, Making, Tools, Wire-Working.	Dec. 28	Sept. 14	271
112	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Dec. 26	July 6	582
	Between one and two months.			
164	XXXIII. Canes, Canopies, Cutlery, Domestic Cooking Vessels, Electricity, Medical and Surgical, Electric Signaling, Fireproof Buildings, Harness, Masonry, Tents, and Umbrellas.	Dec. 22	July 31	755
122	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	Dec. 21	July 19	668
232	IV. Bridges, Conveyers, Cranes and Derricks, Excavating, Hoisting, Hydraulic Engineering, Loading and Unloading, and Towers.	Dec. 19	Dec. 23	270
109	XVI. Telegraphy and Telephony	Dec. 18	Dec. 2	256
147	XXIX. Coopering, Roofs, Wheelwright-Machines, Wooden Buildings, Wood-Sawing, Wood-Turning, Woodworking-Tools.	Dec. 16	Sept. 28	363
167	V. Fine Arts, Bookbinding, Harvesters, Jewelry, and Music.	Dec. 14	Dec. 4	333
312	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	Dec. 13	Nov. 1	483
324	XII. Elevators, Journal-Boxes, Lubricators, Machine Elements, Pulleys and Shafting.	Dec. 12	Oct. 17	428
179	XX. Artificial Limbs, Builders' Hardware, Dentistry, Locks and Latches, Safes, Undertaking.	Dec. 12	July 3	372
382	XXVIII. Air and Gas Engines, Air and Gas Pumps, Pneumatics.	Dec. 12	June 3	879
142	IX. Baths and Closets, Fire-Extinguishers, Hydraulic Motors, Pumps, Sewerage, and Water Distribution.	Dec. 7	June 4	1040
375	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, Washing Apparatus.	Dec. 5	Aug. 3	639
330	XIII. Arms, Projectiles, and Explosive Charges, Making, Metal-Working, Needle and Pin Making.	Nov. 20	Sept. 5	537
	Between two and three months.			
315	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	Nov. 6	Aug. 10	514

Total number of applications awaiting action 17,916

159	TRADE-MARKS, DESIGNS, LABELS AND PRINTS.			
	Between one and two months.			
	Trade-Marks	Dec. 6	Nov. 29	3488
	Under one month.			
	Designs	Jan. 6	Dec. 22	64

Trade-Marks.

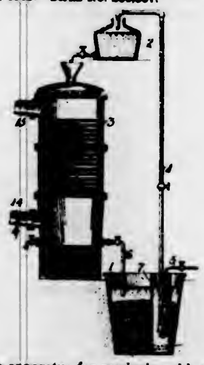
The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE, which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor.

PATENTS

GRANTED JANUARY 30, 1906.

810,897. APPARATUS FOR PRODUCING COMPOUNDS OF TIN. CHARLES H. ACKER, Niagara Falls, N. Y., assignor to Acker Process Company, a Corporation of New Jersey. Filed June 8, 1903. Renewed June 23, 1905. Serial No. 266,897.



Claim.—1. An apparatus for producing chlorin compounds of tin, comprising a dissolving vessel for effecting the solution of tin in a solvent containing chlorin, a reaction-tower, means for circulating the solution through said dissolving vessel and reaction-tower, means for producing a gaseous mixture containing chlorin and a diluent in sufficient proportion to prevent undue rise of temperature, and means for delivering said mixture to said reaction-tower, substantially as described.

2. An apparatus for producing chlorin compounds of tin, comprising a dissolving vessel for effecting the solution of tin in a solvent containing chlorin, a reaction-tower, means for circulating the solution through said dissolving vessel and reaction-tower, means for producing a gaseous mixture containing chlorin and hydrochloric acid, and means for delivering said mixture to said reaction-tower, substantially as described.

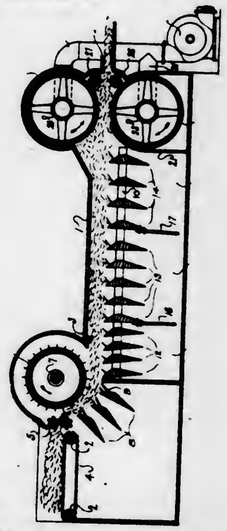
3. An apparatus for producing chlorin compounds of tin, comprising a dissolving vessel for effecting the solution of tin in a solvent containing chlorin, a reaction-tower, means for circulating the solution through said dissolving vessel and reaction-tower, means for producing a gaseous mixture containing chlorin, means for introducing steam into said mixture, and means for delivering said mixture to said reaction-tower, substantially as described.

4. An apparatus for producing chlorin compounds of tin, comprising a dissolving vessel for effecting the solution of tin in a solvent containing chlorin, a reaction-tower, means for circulating the solution through said dissolving vessel and reaction-tower, an electrolytic cell for the production of chlorin, means for diluting the chlorin produced by said cell, and means for delivering the diluted chlorin to said reaction-tower, substantially as described.

810,898. MACHINE FOR DISINTEGRATING, CLEANING, AND ASSORTING FIBROUS MATERIALS. WILLIAM S. ARCHER, Providence, R. I. Filed Oct. 5, 1904. Serial No. 227,577.

Claim.—1. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of bars intermediate the feeding and delivery mechanism and suction means acting in a horizontal direction on the fiber from its introduction into the machine, for conveying the material fed over the bars, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

2. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed bars intermediate the feeding and delivery mechanism, and suction means acting in a horizontal direction on the fiber from its introduction into the machine for conveying the material fed over the bars, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.



3. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed-bar series intermediate said mechanism, the bars of each series as their distances from the picker-roller increases being inclined at a different vertical angle from the bars of the other series, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

4. In a machine of the class described, the combination with the feeding and delivery mechanism, of toothed-bar series intermediate said mechanisms, one series being vertical and the other two series being inclined in relation to the vertical series, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

5. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed-bar series intermediate said mechanism, the bars of each series being interspaced differently from the bars in the other series, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

6. In a machine of the class described, the combination with the feeding and delivery mechanism, of a series of inclined toothed bars near the feeding mechanism, a second series of toothed bars next the first bar series vertically positioned and wider spaced, and a third series of toothed bars oppositely inclined to the inclination of the first series and spaced wider than the second series and mounted next the second bar series, said series being arranged at different distances from the picker-roller, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

7. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed-bar series intermediate said mechanism, said series being disposed at different distances from the picker-roller, the bars of each series being inclined at a different vertical angle from the bars of the other series, and suction means for forcing the material fed across the bars, and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

8. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed-bar series intermediate said mechanisms, and disposed at gradually-increasing distances from the picker-roller the bars of each series being inter-spaced differently from the bars in the other series, and suction means for forcing the materials fed across the bars and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

9. In a machine of the class described, the combination with the feeding and delivery mechanism, of an oblong casing intermediate said mechanisms, a plurality of toothed bars mounted transversely in the casing, and strips depending from the bars to form adjacent receptacles.

10. In a machine of the class described, the combination with the feeding and delivery mechanism, of a plurality of toothed bars intermediate the feeding and delivery mechanism, a meshed surface adjacent the toothed bars, and suction means acting in a horizontal direction on the fiber from its introduction into the machine for forcing the material fed against the meshed surface and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

11. In a machine of the class described, the combination with a horizontal series of toothed bars of a meshed surface adjacent the toothed bars and suction means acting in a horizontal direction on the fiber from its introduction into the machine for conveying the materials over the bars and forcing said materials against the meshed surface and separated receptacles beneath said bars and in connection with which said bars are differently spaced.

12. In a machine of the class described, the combination with a series of toothed bars of a revoluble cage adjacent the toothed bars, a perforated hollow shaft upon which the cage is mounted, a blower, and a pipe connecting the blower and shaft.

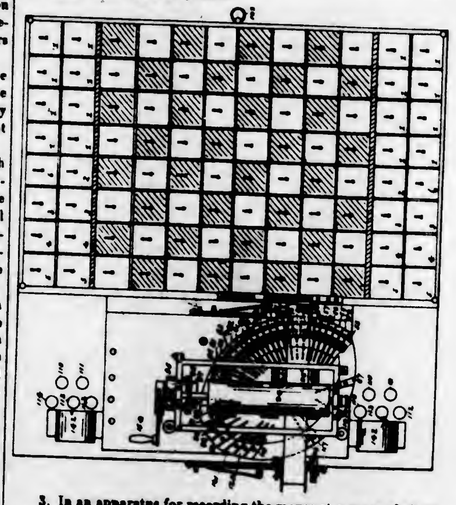
13. In a machine of the class described, the combination with a series of toothed bars and separated receptacles beneath said bars and in connection with which said bars are differently spaced of a revoluble cylindrical cage adjacent the bars, suction means acting in a horizontal direction on the fiber from its introduction into the machine for forcing the materials over the bars and against the cage, and a roll adjacent the cage adapted to strip the material from the cage periphery.

14. In a machine of the class described, the combination with a series of toothed bars and separated receptacles beneath said bars and in connection with which said bars are differently spaced of revoluble cylindrical cages adjacent the bars, suction means acting in a horizontal direction on the fiber from its introduction into the machine for conveying materials over the bars and intermediate the cages, and a roll adjacent each cage for delivering the materials.

810,899. CHESS-RECORDER. LALA RAJA BABU, Patiala, Patiala State, India. Filed July 14, 1905. Serial No. 269,804.

Claim.—1. In an apparatus for recording the moves at a game of chess, the combination of a game-board having a keyhole in the center of each square, a key on the base of each piece adapted to fit into any of said keyholes, type corresponding with the name of the piece moved, actuated by the partial rotation of the key on the piece so moved, a lug or ward on the key, a series of six horizontal bars placed under each of the eight cross-lines of squares actuated by said lug or ward when the key is rotated, a bell-crank lever connected to the uppermost bars, a type-head connected on the other end of said lever, a recording-platen on which the type-head is adapted to print a sign representing the name of one piece, a type-bar actuated in like manner from the second bars in all the series, said type-bar carrying a sign to represent the name of another piece, and similarly with the remaining bars of all the series, said lug or ward on the key being so placed that when such key is inserted in a keyhole and rotated it actuates the bar in the series connected to the type-bar intended to print the name of the piece to which such key is attached.

2. In an apparatus for recording the moves of a game of chess, the combination of a game-board having a keyhole in the center of each square, a key on the base of each piece adapted to fit into any of said keyholes, type actuated by said key, said type indicating the file of the square to which the piece carrying the key is moved, a lug or ward on said key, eight horizontal longitudinal bars, one placed under each of the eight longitudinal lines of squares, one of said bars being adapted to be actuated by said lug or ward of said key, a bell-crank lever connected to the bar under the extreme line of squares on the right side, a type-head carrying the sign representing the file of the king's castle connected to the other end of said bell-crank lever, a type-head carrying the sign representing the file of the king's knight actuated by the next bar, and so on, the position of all such lugs or wards on the keys being similar so that when a key is rotated it actuates the bar in the file of squares in which it is placed to cause the sign of that file to be printed.



3. In an apparatus for recording the moves at a game of chess, the combination of a game-board having a keyhole in the center of each square, a key on the base of each piece adapted to fit into any of said keyholes, type recording the number of the row of squares to which a piece is moved actuated by the key of said piece, a lug or ward on the key, eight horizontal cross-bars, one placed under each of the eight cross-rows of squares, one of which bars being actuated by the partial rotation of the key, a bell-crank lever connected to the bar under the back row of the white side of the board, said lever carrying type to print the sign "1" to represent the number of each square in that row, the next bar being in like manner arranged to actuate the type printing the sign "2" and similarly the other bars, the last being connected to actuate the type-bar printing the sign "8," the position of all such lugs or wards on the keys being similar so that when a key is inserted in a keyhole and rotated it actuates the bar in the cross-row in which it is placed and through it causes the sign of that row to be printed.

4. In an apparatus for recording the moves at a game of chess, the combination of a game-board having a keyhole in the center of each square, a key on the base of each piece adapted to fit into any of said keyholes and be capable of partial rotation, type actuated by the rotation of said key, two lugs or wards on said key, a series of six horizontal bars placed under each of the eight cross-lines of squares, one of which bars being actuated by the first of said lugs, the position of said lug varying according to the name of the piece, a bell-crank lever connected to the uppermost bars in all the series, a type-bar adapted to print a sign representing the name of one piece mounted on said bell-crank lever, a recording-platen for said type-bar, a type-bar connected to and actuated by, in like manner, the second bars in all the series, said type-bar carrying a sign to represent the name of another piece, and similar with the remaining bars of all the series, type indicating the file of the square to which the piece is moved, said type being actuated by the upper portion of said second lug, the position of said second lug being the same for any piece, eight horizontal longitudinal bars, one placed under each of the eight longitudinal lines of squares, one of which bars being actuated by the partial rotation of said key, a bell-crank lever connected to the bar under the extreme line of squares on the right side, a type-head attached to the other end of said bell-crank, said type-head printing the sign representing the file of the king's castle, the actuation of the next bar printing the sign of the king's knight and so on, type actuated by the lower portion of said second lug on said key, the position of which being the same for any piece, said type recording the number of the row of squares to which a piece is moved, eight horizontal cross-bars, one placed under each of the eight rows of squares, one of said bars being actuated by the partial rotation of said key, a bell-crank lever connected to the bar under the back row of the white side, type connected to said lever to print the sign "1" to represent the number of each square in that row, the next bar being in like manner arranged to actuate the type carrying the sign "2" and similarly the other bars, the last bar being connected to actuate the type-bar carrying the sign "8," all three type-bars actuated by the rotation of a piece making their record together.

5. In an apparatus for recording the moves at a game of chess, sixteen additional squares at each end of the board having keyholes therein for the reception of the taken pieces, a type-bar carrying the sign "×" to represent the taking of a piece, means for actuating said type-bar, and means for printing the name of the piece taken consisting of horizontal bars placed below said keyholes, type-bars carrying the signs representing the pieces, queen, bishop, knight, castle, pawn and pawn converted into a queen, said type-bars being connected to the horizontal bars, special squares for each class of piece and the record being made by the insertion of the key on the base of a piece and the partial rotation of the same.

6. In combination in an apparatus of the class described, a game-board and pieces therefor, keys on the base of said pieces adapted to fit keyholes on the squares of said board and operate means for printing the name of the piece and the square to which it is moved by the partial rotation of the piece, a platen and means for operating the same consisting of clockwork mechanism controlled by an escapement-wheel, dogs engaging said escapement-wheel, said dogs being operated by the movement of the pieces, and means for operating the dog mechanism independently of the pieces, substantially as described.

7. In combination in an apparatus of the class described, a game-board and pieces therefor, keys on the base of said pieces adapted to fit keyholes in the squares of said board and operate means for printing the name of the piece and the square to which it is moved by the partial rotation of the piece, a clockwork mechanism rotating a platen, means for controlling the movement of said platen consisting of an escapement-wheel controlled by dogs, and means for printing a line below the record of every other move consisting of a spindle rotated by said clockwork mechanism, a disk on said spindle, pins mounted on said disk, the number of pins of said disk being exactly half that of the teeth of said escapement-wheel, a pivoted lever having a curved end capable of engagement with said pins which by the rotation of said spindle are caused to strike said curved end of the lever and cause its other end to actuate a crank-lever carrying a type-head to print a straight line.

8. An apparatus for recording the moves at a game of chess comprising a game-board having a keyhole in the center of each square, keys on the base of the pieces adapted to fit said keyholes and operate means for printing the name of the piece and the square to which it is moved by the partial rotation of the piece, a platen and means for operating the same consisting of clockwork mechanism controlled by an escapement-wheel, dogs engaging said escapement-wheel, said dogs being operated by the movement of the pieces, means for operating the dog mechanism independently of the movement of the pieces, sixteen additional squares at each end of the board, means for recording the taking of the pieces, means for printing a line below the record of every other move, additional means independent of the escapement mechanism for printing the signs to represent "check," "castles," "resigns," "draw" and "mate" respectively, and means for alternately starting and stopping two clocks to record the time taken by each player, substantially as described.

810,900. FLEXIBLE TOY-HANGER. HENRY F. BARTLETT, Hamilton, Canada. Filed Dec. 2, 1904. Serial No. 235,196.

Claim.—A flexible toy-hanger formed of one piece of spring-steel wire, the upper part bent in circular form with a hook at the extremity, the central part vertical, the bottom part bent first horizontally at right angles to the central part, thence upward, thence downward, thence horizontally, thence upwardly, thence downwardly, thence horizontally, and terminating in a twist around the bottom of the vertical portion, and a yoke having a loop in the center to hang on the top extremity of the hanger provided with a hook at each end, all arranged and constructed substantially as and for the purpose specified.

810,901. COVERED BOX. JULIUS BERGOFF, Buffalo, N. Y., assignor to Empire Jewelry Case Company, Buffalo, N. Y., a Corporation of New York. Filed June 14, 1905. Serial No. 265,205.

Claim.—1. A box of the character described, comprising a cup forming the body of the box, a covering applied to said cup, a block consisting of a cup-like member inserted in said body-cup and projecting above the same to form a neck, and a covering applied to the top and sides of the block and confined between the body and the block, substantially as set forth.

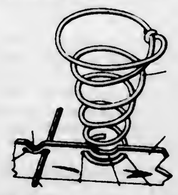
2. A box of the character described, comprising a cup forming the body of the box, a covering applied to said cup and folded over the upper edge and against the inner side thereof, a block consisting of a cup-like member inserted in the body and projecting above the same to form a neck, and a covering applied to the top and sides of the block and bearing at its sides against the folded upper portion of said body-covering, substantially as set forth.

3. A box of the character described, comprising a cup forming the body of the box, a covering applied to said cup and folded over the upper edge and against the inner side thereof, a block consisting of a cup-like member inserted in the body and projecting above the same to form a neck, and a covering applied to the top and sides of the block and folded inwardly over the lower edge thereof, the side of the block-covering and the folded upper portion of the body-covering being clamped between the body and the block and the folded lower portion of the block-covering being confined between the lower edge of the block and the bottom of the body, substantially as set forth.

4. A box of the character described, comprising a cup forming the body of the box, a covering applied to said cup, a block consisting of an inverted cup inserted in the body and provided in its top with an opening, and a covering extending over the top and sides of the block and confined between the block and the body, substantially as set forth.

5. A box of the character described, comprising a cup forming the body of the box, a covering applied to said cup, a block consisting of an inverted cup inserted in the body and provided in its top with one or more integral lips or clasps, and a covering applied to the top and sides of the block and provided with slits through which said lips pass, substantially as set forth.

810,902. MEANS FOR SUPPORTING UPHOLSTERY-SPRINGS. GEORGE B. BIGELOW, Worcester, Mass., assignor to The Morgan Spring Company, Worcester, Mass., a Corporation of Massachusetts. Filed Aug. 23, 1905. Serial No. 275,457.



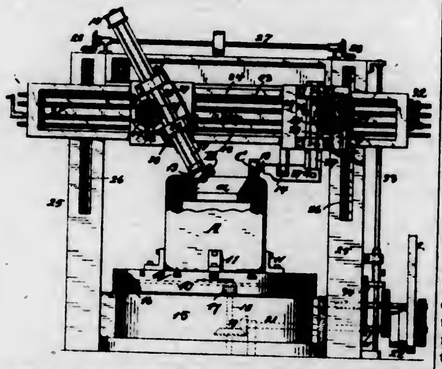
Claim.—1. In a construction of the class described, the combination of a sheet-metal supporting-strip and an upholstery-spring, said supporting-strip having a slot with tapering pinching-sections at its ends for receiving the attaching-coil of the spring and located near the edge of the supporting-strip so that the material above the slot may be bent in to fasten the parts together.

2. In a construction of the class described, the combination of a supporting-strip and an upholstery-spring, the supporting-strip be-

ing provided with a slot for receiving the attaching-coil of the upholstery-spring, which slot has tapering pinching-sections at its end with a depression between them and said slot being located near the edge of the strip so that the material above the same may be bent down into the depression to fasten the parts together.

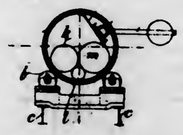
3. In a construction of the class described, the combination of a frame, sheet-metal supporting-strips extending across the frame, a tie-wire extending transversely through the supporting-strips, and a plurality of upholstery-springs, the supporting-strips being provided with slots for receiving the attaching-coils of the upholstery-springs, each of said slots having narrow recesses at its ends separated by a central depression and said slots being located near the edges of the strips, whereby the material above the same may be bent down to lock the parts together.

810,903. GRINDING-MACHINE. CHARLES H. BLOOMSBURGH, Bellevue, Ky., assignor to Victor Safe & Lock Co., Cincinnati, Ohio, a Corporation of Ohio. Filed Dec. 14, 1904. Serial No. 236,708.



Claim.—In a grinding-machine, the combination of a work-supporting table, means to rotate it, a rotary grinding-wheel, a spindle on which it is mounted, a pulley on the spindle to rotate it a spindle-carrier, a rotary head on which it is supported to have a sliding adjustment lengthwise, a slide on which this rotary head is mounted for rotary adjustment, a rail on which this slide is supported for transverse adjustment and a frame on which this rail is supported for vertical adjustment.

810,904. APPARATUS FOR GRINDING OR CRUSHING FOUNDRY-SAND, &c. PHILIBERT BOUVILLAIN, Paris, France. Filed June 1, 1904. Serial No. 210,743.

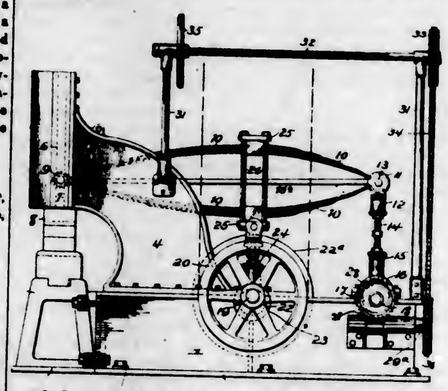


Claim.—In an apparatus for grinding or crushing foundry-sand and other similar granular materials, the combination with a hollow rotatable cylinder, of three series of internal rollers of different diameters touching each other and the interior wall of the roller, a scraper in contact with the upper generatrix of the said wall of the roller, and a counterbalance-lever adjustably mounted upon the axis of said scraper, substantially as shown and described.

810,905. POWER-HAMMER. AUSTIN BRAGG, Waterville, Me. Filed Feb. 20, 1904. Serial No. 194,573.

Claim.—1. In a power-hammer, the combination with a ram or hammer of an elliptic spring-helve having both of its members connected at one end to said ram or hammer and the other ends of said members pivotally supported and means connected to the two members of said spring-helve intermediate the ends thereof for actuating it, substantially as set forth.

2. In a power-hammer, the combination with a ram or hammer and a movable support, of an elliptic spring-helve having its two members connected at one end to said ram or hammer and at the other end pivotally connected to the movable support, and means connected to the members of the spring-helve intermediate the ends thereof for operating same.



3. In a power-hammer the combination with a ram or hammer and a lengthwise-adjustable support, of an elliptic spring-helve having both of its members connected at one end to said ram or hammer and at the other end pivotally connected to the adjustable support and means connected to the helve intermediate its ends for operating same.

4. In a power-hammer the combination with a ram or hammer and a swinging fulcrum, the latter being constructed whereby it may be lengthened or shortened, of an elliptic spring-helve having both of its members connected at one end to the ram or hammer and at the other end pivotally connected to the free end of the fulcrum, and means engaging the two members of the helve intermediate the ends thereof for operating same.

5. In a power-hammer, the combination with a ram or hammer, of a movable fulcrum, an elliptic spring-helve connecting said ram and fulcrum, bars on opposite sides of said spring-helve, clamping-bolts connecting said bars and adapted to adjust the tension and flexibility of the spring-helve, and operating means connected with said helve between its ends.

6. In a power-hammer, the combination with a frame, of an elongated ram or hammer guide in said frame, a ram or hammer in said guide having an opening therein, a fulcrum-rod, an elliptic spring-helve having eyes in the ends of its two members, one of said eyes pivotally mounted in the opening in the ram and the other pivotally mounted on the fulcrum-rod, an eccentric, and a pitman connecting said eccentric with the helve between the ends of the latter.

7. In a power-hammer, the combination with a frame, of a head having ram-guides therein and pivoted at its lower end to said frame, a shaft carried by the head, pinions on said shaft, racks on the frame in mesh with said pinions, a hand-wheel to turn the shaft, and a lock-nut to secure the parts at any adjustment.

8. In a power-hammer the combination with a ram or hammer, of an elliptic spring connected at one end to the ram or hammer and at its other end to a fulcrum, a bar connecting the two ends of the spring-helve and means intermediate the ends of the helve for operating same.

9. In a power-hammer the combination with a ram or hammer, of an elliptic spring-helve connected at one end to said hammer and at its other end to a fulcrum, means connecting the semi-elliptic sections of the spring for regulating their tension and means connected to the helve intermediate its ends for operating same.

810,906. RAILWAY-SWITCH. CHARLES B. BUSHONG, West Lebanon, Ind., assignor to The Brinker Safety Switch Attachment Company, West Lebanon, Ind., a Corporation of Indiana. Filed Sept. 30, 1905. Serial No. 280,782.

Claim.—1. In a device of the class described, a movable switch, means for shifting the same, a member for locking the switch in shifted position, said member including a relatively movable section, means for coupling said section to the locking member, a track device connected with the section, and automatically-operable means for uncoupling the member and section at determined intervals.

2. In a device of the class described, a movable switch, means for shifting the same, a locking member for maintaining the switch in shifted position, said member including a relatively movable section, a track-lever operatively connected with said section, a pivoted member for coupling the locking member and section, and means for operating the coupling member to couple and uncouple said parts at determined intervals.

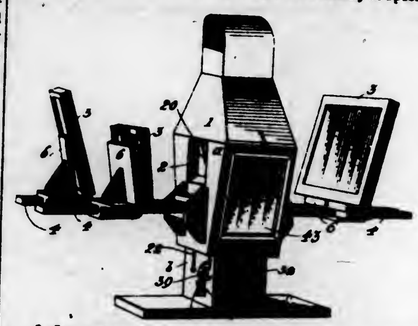
3. In a device of the class described, a movable switch, means for shifting the same, a longitudinally-movable locking-rod for maintaining the switch in shifted position, said rod including a relatively movable section, a pivoted locking member for coupling the rod and section, a track device connected with the section, and means for operating the pivoted locking member to uncouple the section and rod at determined intervals.

4. In a device of the class described, a movable switch, means for shifting the same, a longitudinally-movable locking-rod for maintaining the switch in shifted position, said rod including a relatively movable section, a pivoted locking member designed for coupling the rod and section, a track device connected with the section and operable for actuating the rod, and means for operating the pivoted locking member to uncouple the rod and section at determined intervals.

5. In a device of the class described, a movable switch, means for shifting the same, a longitudinally-movable locking-rod for maintaining the switch in shifted position, said rod including a relatively movable section, a pivoted locking member designed for coupling the rod and section, a track device connected with the section and operable for actuating the rod, a depressible detector-bar, and an actuating-lever connected with the bar and having connection with the pivoted locking member and section, said actuating member being adapted when the bar is depressed to operate the pivoted locking member for uncoupling the section and for moving the latter rearwardly to depress the track device.

810,907. APPARATUS FOR PRINTING PHOTOGRAPHS. BUTHANIEL I. BROWN, Princess Anne, Md. Filed Mar. 16, 1905. Serial No. 249,943.

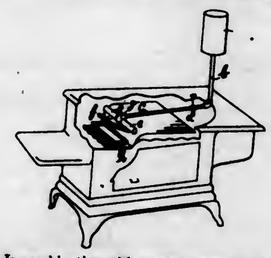
Claim.—1. In an apparatus for printing photographs, an interiorly-lighted cabinet having openings in the walls thereof for the emission of light, and means to support in a stationary condition photograph-frames, adjustable in position with respect to the said openings, combined with shutters for the said openings, a clock-movement to operate the said shutters, and mechanism whereby the operation of the said clock-movement is regulated to effect the duration of the time of exposure of the said openings, substantially as specified.



2. In an apparatus for printing photographs, a cabinet containing a lamp, having openings in its walls for the emission of light from the lamp, shutters which are held yieldingly in a condition whereby the said openings in the walls of the cabinets are covered, a clock-movement adapted when the shutters are opened by hand, to cover the same, and mechanism whereby the time of exposure, is regulated, and means for supporting photograph-frames exteriorly of the cabinet, and adjustable with reference to the openings in the cabinet, substantially as specified.

3. In an apparatus for printing photographs, comprising an interiorly-illuminated cabinet with openings in the walls thereof, the combination of a shaft, an arm extending from the shaft, a shutter on the said arm arranged to pass from a position over the said opening to one whereby the said opening is uncovered, a spring mechanism to yieldingly hold the said shutter in a closed position, a clock-movement which is normally inoperative to effect any movement of the shutter, and mechanism whereby the shutter is manually opened, and automatically closed by the clock-movement independently of the hand, substantially as specified.

810,908. PETROLEUM-BURNER. GOLIAH CARL, Wamego, and ALBERT SOHNS, Clay Center, Kans. Filed June 8, 1905. Serial No.

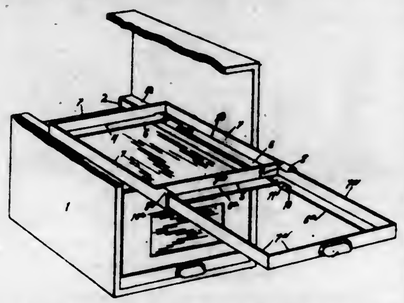


Claim.—In combination with a stove, a petroleum-burner comprising in its entirety a single length of pipe horizontally disposed in said stove in the space between the top and the top of the oven thereof, said pipe extending from a point slightly beyond the end of the oven adjacent the grate to a point adjacent the rear end of the stove, a single vertical length of pipe connected to the rear end of said horizontal pipe, a tank on the upper end of said vertical pipe, a valve in said horizontal pipe adjacent said vertical pipe, said valve having the handle thereof extending without the stove-top, a burner consisting of a perforated tubular element connected at an intermediate portion thereof to the front end of said horizontal pipe, said burner being spaced from and overlying the grate, and a drip-pan of the same contour as said burner supported solely by said grate.

810,909. CARRIAGE FOR DISPLAY-RACKS. WILLIAM CATLIN and MILTON MCMILLAN, Kansas City, Mo. Filed Feb. 28, 1905. Serial No. 247,794.

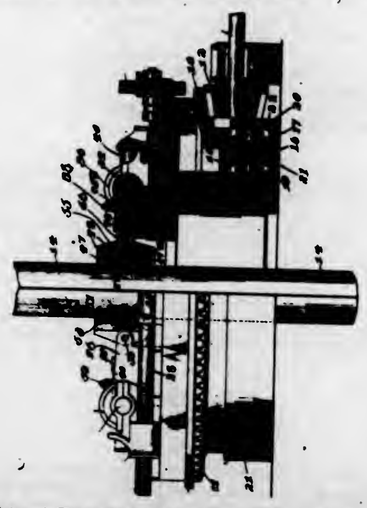
Claim.—1. In a device of the class described, in combination with a suitable rack, a carriage comprising the inner member 4 which is secured to the rack, said member having the horizontal

bases 6 and the vertical guards 7, the flanges 8 8° having lips 9 9° and flanges 10 10° having lips 11 11° on the outer end of said member 4, and the outer member 5 adapted to telescope with member 4, substantially as set forth.



2. In a device of the class described, in combination with a suitable rack, a carriage comprising an inner member slidably mounted in the rack and having flanges 8 8° and 10 10° provided with lips 9 9° and 11 11°, an outer carriage member engaged by said lips and flanges and adapted to telescope with said inner member, and means for limiting the travel of said inner member, all substantially as set forth.

810,910. WELL-SINKING APPARATUS. MATTHEW T. CHAPMAN, Aurora, Ill. Filed Nov. 14, 1901. Serial No. 82,908.



Claim.—1. The combination of a rotary support, a series of traveling rollers upon which said support is mounted, said rollers having their peripheries parallel with their axes and being arranged in pairs the rollers of each pair having their axes in alinement, inner and outer rings between which said rollers travel, a gripping-jaw carried by said carriage, and gripping mechanism supported on said rotary support, substantially as described.

2. The combination of a rotary support, traveling antifriction-rollers on which said rotary support is mounted, said rollers being arranged in pairs, a common axle for each pair of rollers, inner and outer rings in which the ends of said axles are carried, and gripping mechanism on said rotary support, substantially as described.

3. The combination of a rotary support, antifriction-rollers on which said support is carried, said rollers having their peripheries parallel with their axes and being arranged to travel in concentric paths, inner and outer traveling rings between which said rollers are mounted, means for holding the rollers in position as they travel, and gripping mechanism upon the rotary support, substantially as described.

4. The combination of a rotary support, a carriage mounted on said support, a support pivotally carried by said carriage, a gripping device, a support by which said gripping device is carried, the latter support being pivotally connected with said pivoted support, and coöperating gripping mechanism.

5. The combination of a rotary support, a carriage mounted on said support, a support pivotally carried by said carriage and arranged to swing in a vertical plane, a gripping device, a support by which said gripping device is carried, the latter support being pivotally connected with said pivoted support, and coöperating gripping mechanism.

6. The combination of a rotary support, a carriage mounted on said support, a support pivotally mounted on said carriage and arranged to swing in a vertical plane, a plurality of gripping devices, supporting means for said gripping devices pivotally carried by said pivoted support, and coöperating gripping devices.

7. The combination of a rotary support, a carriage mounted thereon, a support carried by said carriage, a pivoted support carried by said first-mentioned support, a plurality of gripping devices carried by said pivoted support, in different horizontal planes, and coöperating gripping mechanism, substantially as described.

8. The combination of a rotary support, a carriage mounted thereon, a support carried by said carriage, a pivoted support carried by said first-mentioned support, a plurality of gripping devices carried by the pivoted support, in different horizontal planes, said gripping devices having sharp angles adapted to engage the article to be rotated, and coöperating gripping mechanism, substantially as described.

9. The combination of a rotary support, a carriage mounted thereon, a support carried by said carriage, a plurality of sets of gripping devices pivotally carried by the latter support, said sets of gripping devices being in different vertical planes, and the gripping devices of each set being in different horizontal planes, and coöperating gripping mechanism.

10. The combination of a rotary support, a carriage mounted thereon, a support carried by said carriage, a plurality of gripping devices carried by said support in different horizontal planes, separate pivots for said gripping devices, and coöperating gripping mechanism, substantially as described.

11. The combination of a rotary support, a carriage mounted thereon, a support carried by said carriage, a plurality of sets of gripping devices carried by said support, said sets of gripping devices being in different vertical planes and the gripping devices of each set being in different horizontal planes, separate pivots for said gripping devices, and coöperating gripping mechanism, substantially as described.

12. A gripping device adapted to grip a round article for rotating the same without interfering with longitudinal movement thereof, consisting of a suitable support, and a plurality of sets of gripping devices pivotally mounted thereon, said sets of gripping devices being arranged in different vertical planes, the gripping devices of each set being in different horizontal planes, substantially as described.

13. A gripping device, adapted to grip a round article for rotating it without interfering with longitudinal movement thereof, consisting of a suitable support, and a plurality of sets of gripping devices carried thereby, said sets of gripping devices being arranged in different vertical planes, the gripping devices of each set being in different horizontal planes, each gripping device consisting of a rotary disk mounted on a separate pivot, substantially as described.

14. A gripping device, adapted to grip a round article for rotating it without interfering with longitudinal movement thereof, consisting of a suitable support, and a plurality of sets of gripping devices carried thereby, said sets of gripping devices being arranged in different vertical planes, the gripping devices of each set being in different horizontal planes, each gripping device consisting of a rotary disk mounted on a separate pivot, said disks being arranged so that one of the edges thereof will engage the article to be gripped, substantially as described.

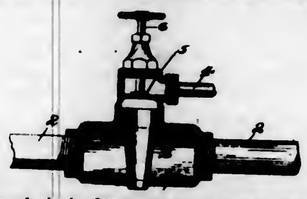
15. A gripping device, adapted to grip a round article for rotating it without interfering with longitudinal movement thereof, consisting of a suitable pivoted support, and a plurality of sets of gripping devices carried thereby, said sets of gripping devices being arranged in different vertical planes, the gripping devices of each set being in different horizontal planes, each gripping device consisting of a rotary disk mounted on a separate pivot, substantially as described.

16. A gripping-jaw, adapted to bear against and engage a round article for coöperating with other mechanism to rotate it without interfering with longitudinal movement thereof, consisting of a suitable support, and gripping-rollers mounted therein in different vertical planes, the axes of said rollers being arranged to lie at an angle to each other, the edges of said rollers being arranged to engage the article to be gripped, substantially as described.

17. A gripping-jaw, adapted to bear against and engage a round article for coöperating with other mechanism to rotate it without interfering with longitudinal movement thereof, consisting of a suitable support, and a plurality of sets of gripping devices carried thereby, said sets of gripping devices being arranged in different vertical planes, the gripping devices of each set being in different horizontal planes, each gripping device consisting of a rotary disk, said disks being so arranged that one of the edges thereof will engage the article to be gripped, the pivots of said disks being arranged at an angle to each other, substantially as described.

18. The combination of a rotary support, a series of traveling rollers upon which said support is mounted, said rollers arranged in pairs and having their peripheries parallel with their axes, inner and outer rings between which said rollers travel, and gripping mechanism upon said rotary support, substantially as described.

810,911. DRIP DEVICE FOR STEAM SYSTEMS. WILLIAM J. CLARK, Chicago, Ill. Filed May 31, 1904. Serial No. 210,266.



Claim.—1. A pipe-fitting of integral structure, comprising a section of pipe forming a chamber provided with means for connecting the same in a pipe-line, and a drip-pipe extending transversely through the chamber, the outlet end of the drip-pipe terminating at a point substantially in line with the wall of the chamber.

2. A pipe-fitting comprising a section of pipe with means for connecting the same in a pipe-line, provided with a drip-nozzle formed integral with the fitting and extending transversely through the chamber, the outlet end of the drip-pipe terminating at a point substantially in line with the wall of the chamber, and a valve controlling the drip-nozzle.

3. A pipe-fitting comprising a section of pipe constructed with means for connecting the same in a pipe-line provided with a drip-nozzle formed integral with the fitting and extending transversely therethrough, in combination with a controlling-valve for the drip-nozzle arranged at a point therein within the chamber, the outlet end of the drip-pipe terminating at a point substantially in line with the wall of the chamber.

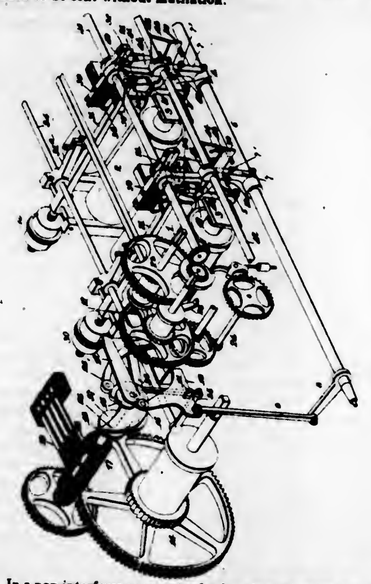
4. A pipe-fitting comprising a section of pipe constructed with means for connecting the same in a pipe-line, provided with an integral chamber, and a drip-nozzle formed integral with the fitting extending therethrough, the outlet end of the drip-nozzle terminating at a point substantially in line with the wall of the chamber, in combination with a valve for the drip-nozzle arranged at a point therein within the chamber, and means outside the chamber for controlling the valve.

5. In a heating system, the combination with a conduit for the heating medium, of a drip-nozzle projecting transversely through the conduit and exposed on all sides to the direct action of the heating medium as the same passes through the conduit, the outlet end of the drip-nozzle terminating at a point substantially in line with the wall of the chamber.

6. A steam system comprising a steam-pipe, and a drip-pipe connected thereto, the outer wall of the drip-pipe being in the direct path of the passing steam in said first-mentioned pipe and surrounded by the latter, the outlet end of the drip-pipe terminating substantially at the wall of the steam-pipe.

810,912. AUTOMATIC NON-INTERFERING REPEATER FOR FIRE-ALARM CIRCUITS. FREDERIC W. COLE, Newton, Mass. Filed Jan. 31, 1903. Serial No. 141,894.

Claim.—1. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, and a lock for each moving device, the lock being controlled by that moving device which is first in the retracted position after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices, whereby the signal of the circuit in control will be continued to be sent without mutilation.



2. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, a lock for each moving device, and means for mechanically controlling the lock, by that moving device which is first in the retracted position after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices, whereby the signal of the circuit in control will be continued to be sent without mutilation.

3. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, means for repeating the signal over the street-circuits, a lock for each moving device, and means for mechanically controlling the lock, by that moving device which is first in the retracted position after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices, whereby the signal of the circuit in control will be continued to be sent without mutilation.

4. In a non-interference repeater for fire-alarm circuits, the combination of a plurality of circuits, each including a street-magnet, and a repeating mechanism which comprises moving contact devices and a timing device, of moving devices actuated by the street-magnets, each of said moving devices being capable of movement from a normal to an abnormal position and vice versa and by such movement actuating the repeating mechanism, and the timing device, means for repeating over the street-circuits, a locking-out device for each moving device, means for bringing the locking-out devices into action by the movement of a moving device from the normal to the abnormal position, after a plurality of such moving devices have been simultaneously operated and have ceased to operate in unison, which moving devices will control all of the other locking-out devices and lock out all of such moving devices as are in the normal position and prevent the movement of these moving devices so long as the timing-train is operating.

5. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, a lock for each moving device, means for cutting out the street-circuit of a moving device which has been locked out at the inception of a signal,

the lock being controlled by that moving device which is in a certain position after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices whereby the signal

vice at each impulse to the repeating mechanism, and means for restoring the locking devices controlled by the timing device.

14. In a non-interference repeater for fire-alarm circuits, the

circuits, a repeating-train, a timing-train and a resetting-train, means for locking the moving devices, means actuated by the resetting-train for engaging with the means for locking the moving devices,

for grounding one spring of the pair when the protective device operates, substantially as described.

the lock being controlled by that moving device which is in a certain position after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices whereby the signal of the circuit in control will be continued to be repeated without mutilation over the street-circuits which were locked out at the inception of a signal.

6. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, a lock for each moving device, means for cutting out the street-circuit of a moving device which has been locked out at the inception of a signal, the lock being controlled by that moving device which is in the retracted position after a plurality of moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices whereby the signal of the circuit in control will be continued to be repeated without mutilation over the street-circuits which were locked out at the inception of a signal.

7. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, means for repeating the signal over the street-circuits, and a lock for each moving device, the lock being controlled by that moving device which first operates after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices except the one which thus gets control, whereby the signal of the circuit in control will be continued to be sent without mutilation.

8. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, a lock for each moving device, and means for mechanically controlling the lock by that moving device which first operates after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices except the one which thus gets control, whereby the signal of the circuit in control will be continued to be sent without mutilation.

9. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, and a mechanical lock for each moving device, the lock being controlled by that moving device which first operates after a plurality of the moving devices have been simultaneously operated and have ceased to move in unison, to lock out and render inoperative all of the other moving devices except the one which thus gets control, whereby the signal of the circuit in control will be continued to be sent without mutilation.

10. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal over the street-circuits, locking devices therefor, the said moving devices being normally unlocked and means actuated by each impulse received for locking out all of the moving devices in the normal position when a moving device is in the abnormal position.

11. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, mechanically-controlled locking devices therefor, the said moving devices being normally unlocked and means actuated by each impulse received for locking out all of the moving devices in the normal position when a moving device is in the abnormal position.

12. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal over the street-circuits, mechanically-controlled locking devices therefor, the said moving devices being normally unlocked and means actuated by each impulse received for locking out all of the moving devices in the normal position when a moving device is in abnormal position.

13. In a non-interference repeater for fire-alarm circuits, the combination with a timing device and repeating mechanism, of a series of street-circuits, each embracing a magnet, a moving device for each magnet controlling the repeating mechanism, means for repeating the signal over the street-circuits, means for locking out all circuits not receiving a signal, such circuits staying locked out until the end of a repeated signal, and independent locking-out devices one for each moving device, their freedom to act to lock out a moving device depending upon the position of the corresponding moving device at each impulse to the repeating mechanism, and means for restoring the locking devices controlled by the timing device.

14. In a non-interference repeater for fire-alarm circuits, the combination with a timing device, and repeating mechanism, of a series of street-circuits, each embracing a magnet, a moving device for each magnet controlling the repeating mechanism, means for repeating over the street-circuits, means for cutting out and locking out all circuits not receiving a signal, such circuits staying locked out and cut out until the end of a repeated signal, and independent locking-out devices one for each moving device, their freedom to act to lock out a moving device depending upon the position of the corresponding moving device at each impulse to the repeating mechanism, and means for restoring the locking-out and cutting-out devices controlled by a timing device.

15. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device, which controls means for repeating the signal, means for repeating the signal over the street-circuits, a locking-lever for each moving device, and means for controlling the locking-lever, such means being actuated by the first moving device to get into retracted position after a plurality of moving devices have been simultaneously actuated and cease to move in unison.

16. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device, which controls means for repeating the signal, a locking-lever for each moving device, and mechanical means for controlling the locking-lever, such means being actuated by the first moving device to get into retracted position after a plurality of moving devices have been simultaneously actuated and cease to move in unison.

17. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, means for repeating the signal over the street-circuits, a locking-lever for each moving device, and mechanical means for controlling the locking-lever, such means being actuated by the first moving device to get into retracted position after a plurality of moving devices have been simultaneously actuated and cease to move in unison.

18. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits, each embracing a magnet and a moving device which controls means for repeating the signal, means for repeating the signal over the street-circuits, each moving device having a normal and an abnormal position, a lock, means for locking the moving devices in the normal position, and means for controlling the locking means, such controlling means being controlled by a moving member which gets into the abnormal position, after a plurality of devices have moved in unison and ceased to so move.

19. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits, each embracing a magnet and a moving device which controls means for repeating the signal, each moving device having a normal and an abnormal position, a mechanical lock, means for locking the moving devices in the normal position, and means for controlling the locking means, such controlling means being controlled by a moving member which gets into the abnormal position after a plurality of devices have moved in unison, and ceased to so move.

20. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits, each embracing a magnet and a moving device which controls means for repeating the signal, means for repeating the signal over the street-circuits, each moving device having a normal and an abnormal position, a mechanical lock, means for locking the moving devices in the normal position, and means for controlling the locking means, such controlling means being controlled by a moving member which gets into the abnormal position, after a plurality of devices have moved in unison, and ceased to so move.

21. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device which controls means for repeating the signal, a cut-out in each street-circuit, and a lock-out device for each moving device, means for actuating the cut-out and the locking devices for each street-circuit in normal condition at the inception of a signal, and means for actuating the lock-out devices of all but one of the other street-circuits which were in abnormal condition when a plurality of circuits received a signal simultaneously but whose moving devices cease to move in unison.

22. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device, means for repeating the signal over the street-

circuits, a repeating-train, a timing-train and a resetting-train, means for locking the moving devices, means actuated by the resetting-train for engaging with the means for locking the moving devices, and means actuated by the moving devices for moving the means actuated by the resetting-train, for locking out the moving devices, such means being actuated by a moving device which is first in abnormal position after a plurality of signals have been simultaneously received, and the moving devices cease to move in unison.

23. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device, a repeating-train, a timing-train and a resetting-train, mechanical means for locking the moving devices, means actuated by the resetting-train for engaging with the means for locking the moving devices, and means actuated by the moving devices for moving the means actuated by the resetting-train, for locking out the moving devices, such means being actuated by a moving device which is first in abnormal position after a plurality of signals have been simultaneously received, and the moving devices cease to move in unison.

24. In a non-interference repeater for fire-alarm circuits, the combination of a series of street-circuits each embracing a magnet and a moving device, means for repeating the signal over the street-circuits, a repeating-train, a timing-train and a resetting-train, mechanical means for locking the moving devices, means actuated by the resetting-train for engaging with the means for locking the moving devices, and means actuated by the moving devices for moving the means actuated by the resetting-train, for locking out the moving devices, such means being actuated by a moving device which is first in abnormal position after a plurality of signals have been simultaneously received, and the moving devices cease to move in unison.

25. In a non-interference repeater for fire-alarm circuits, the combination with a street-magnet, a moving device actuated thereby, means for resetting the moving device, means for locking out the moving devices and means for controlling the lock-out means, of a lever having means for engaging with the resetting means, and having a recess for engaging with the lock-out controlling means, to prevent action of the latter upon the lock-out means by the position of the moving devices.

810,918. GUN-CLEANING DEVICE. John D. Coleman, Glenwood, Ill. Filed Mar. 6, 1905. Serial No. 248,574.

Claim.—1. In a device of the character described, a stem comprising a section B, and a section A, said section B, having at one end a swab-holder and provided at its opposite end with a bore encompassed by a rim, said section A, being provided at one end with means for connecting it with a cleaning-rod and having its opposite end provided with an annular groove and inserted in the said bore in section B, the said rim of the latter section being shrunk to fit the said annular groove on section A, said sections being non-separable and independently rotatable.

2. In a device of the character described, a stem comprising a section B, having its outer end adapted to hold a swab, and provided at its opposite or inner end with a longitudinal bore encompassed by a rim; and a section A, having its outer end adapted to be connected with a cleaning-rod, and having its opposite or inner end inserted in said bore in section B, and provided near its inner end with an annular shoulder engaged by the said rim on section B, and having an annular groove located between said shoulder and its inner end, an annular portion of said rim being shrunk to form an inwardly-extending annular rib rotatably fitting said annular groove in section A.

810,914. PROTECTIVE APPARATUS. Frank B. Cook, Chicago, Ill. Filed Dec. 4, 1903. Serial No. 183,733.

Claim.—1. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon but insulated therefrom and from each other, one spring of the pair being rigidly supported by a suitable support, a protective device adapted to be held in a state of stress by the said springs and conductively connected from one spring to the other, a third spring outside of the said pair and mounted flatwise on the ground-plate, but insulated therefrom and from the pair of springs, at its mounting, the said third spring making contact with the outer spring of the pair at its free end, the said third spring and inner spring of the pair being switchboard and line terminals, respectively and means for grounding one spring of the pair when the protective device operates, substantially as described.

2. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon but insulated therefrom and from each other, one spring of the pair being held stationary by a suitable support, one of the said springs being formed into a thimble at its free end, the other said spring being provided with a lip at its free end, a heat-coil adapted to be firmly held in the said thimble, a conducting member on the heat-coil, adapted to engage the said lip, the heat-coil being held in a state of stress by the said springs, a third spring outside of the said pair and mounted flatwise on the ground-plate, but insulated therefrom and from the pair of springs, at its mounting, the said third spring making contact with the outer spring of the pair at its free end, the said third spring and inner spring of the pair being switchboard and line terminals, respectively and means for grounding one spring of the pair when the heat-coil operates, substantially as described.

3. In protective apparatus, the combination with a ground-plate, of bolts extending therethrough and insulated therefrom and from each other, a pair of superposed springs mounted flatwise on the said plate by the said bolts, and insulated from the said plate, and from each other, one spring of the pair being rigidly supported by a suitable support, a protective device adapted to be held in a state of stress by the said springs and conductively connected from one spring to the other, a third spring outside of the said pair and mounted flatwise on the ground-plate by the said bolts, the said third spring being insulated from the ground-plate and from the pair of springs, at its mounting, and making contact with the outer spring of the pair at its free end, the third spring and the inner spring of the pair being switchboard and line terminals, respectively, and means for grounding one spring of the pair when the protective device operates, substantially as described.

4. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon and insulated therefrom and from each other, one spring of the pair being rigidly supported by a suitable support, a protective device adapted to be held in a state of stress by the said springs and conductively connected from one spring to the other, a third spring outside of the said pair and mounted flatwise on the ground-plate, but insulated therefrom and from the pair of springs, at its mounting, the said third spring making contact with the outer spring of the pair at its free end, the said third spring and inner spring of the pair being switchboard and line terminals, respectively, the outer spring of the pair being dead at its mounting, and means for grounding the movable spring of the pair by the operation of the protective device, substantially as described.

5. In protective apparatus, the combination with a ground-plate, of bolts extending therethrough and insulated therefrom and from each other, a pair of superposed springs mounted flatwise on the said plate by the said bolts, and insulated from the said plate and from each other, the outer spring of the pair being insulated from the said bolts, the inner spring of the pair being conductively secured to one of the said bolts and insulated from the other, one of the said springs being rigidly supported by a suitable support, a protective device adapted to be connected between the pair of springs at their free ends, the said device being held in a state of stress by the tension in the said springs, a third spring outside of the said pair and mounted flatwise on the ground-plate by the said bolts, the said third spring being insulated from the ground-plate, from the pair of springs and from the said bolts, at its mounting, and adapted to make contact with the outer spring of the pair at its free end, the third spring and the inner spring of the pair being switchboard and line terminals, respectively, and means operated by the giving away of the protect-

ive device, whereby the inner spring of the pair is ground, substan-

ive device, whereby the inner spring of the pair is ground, substantially as described.

6. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon and insulated therefrom and from each other, one of the said springs being rigidly supported, the other said spring being free to move, a protective device held in a state of stress between the said springs and conductively connected from one spring of the pair to the other, a third spring outside of the said pair and mounted flatwise on the ground-plate, the said third spring being insulated from the ground-plate and from the pair of springs at its fixed end, and making contact with the outer spring of the pair at its free end, a fourth spring interposed between the pair of springs and forming a part of the movable spring of the said pair, the fourth spring being adapted to be electrically connected with the rigid spring of the pair when the protective device operates, and a projection from the movable spring of the pair, adapted to make connection with the ground-plate when the protective device operates, and thereby ground all of the springs of the combination, substantially as described.

7. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon and insulated therefrom and from each other, one of the said springs being rigidly supported, the other said spring being free to move, a protective device held in a state of stress between the said springs and conductively connected from one spring of the pair to the other, a third spring outside of the said pair and mounted flatwise on the ground-plate, but insulated from the ground-plate and from the pair of springs at its fixed end, the said third spring making contact with the outer spring of the pair at its free end, a fourth spring interposed between the pair of springs and forming a part of the movable spring of the pair, a fifth spring interposed between the ground-plate and the inner spring of the pair, mounted flatwise on the ground-plate and insulated from the latter and from the other springs of the set, the said fourth spring being adapted to be electrically connected with the rigid spring of the pair when the protective device operates, and a projection on the movable spring of the pair adapted to make electrical connection with the ground-plate when the protective device operates, and thereby ground all of the springs of the combination, substantially as described.

8. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon but insulated therefrom and from each other, one spring of the pair being held stationary, the other spring being free to move, and one of the said springs being formed into a thimble at its free end, the other said spring being provided with a lip thereon at its free end, a heat-coil adapted to be inserted in, and firmly held by, the said thimble, the said heat-coil being provided with a hollow core and a pin secured therein by fusible material, and a conducting member secured to the said pin and adapted to engage the said lip, an abnormally large current traversing the winding of the heat-coil for a sufficient length of time, causing the fusible material thereof to soften and thus allow the said pin and conducting member secured thereto, to turn, thereby releasing the said conducting member from the said lip and grounding the movable spring of the pair, substantially as described.

9. In protective apparatus, the combination with a ground-plate, of a pair of superposed springs mounted flatwise thereon but insulated therefrom and from each other, one spring of the said pair being held stationary, the other spring being free to move, and one of the said springs being formed into a thimble at its free end, the other said spring being provided with a lip thereon at its free end, a heat-coil adapted to be inserted in, and firmly held by, the said thimble, the said heat-coil being provided with a hollow core and a pin secured therein by fusible material, a conducting member secured to the said pin and adapted to engage the said lip, an abnormally large current traversing the winding of the heat-coil for a sufficient length of time, causing the fusible material thereof to soften and thus allow the said pin and conducting member secured thereto, to turn, thereby releasing the said conducting member from the said lip and grounding the movable spring of the pair, and means adapted to engage the said conducting member and thereby turn the heat-coil within the said thimble, when the protective apparatus is reset, the said lip again engaging the said conducting member as originally, substantially as described.

10. In protective apparatus, the combination with a ground-plate, of a ground-strip secured to one edge thereof, a spring mounted flatwise on the ground-plate and insulated therefrom, a second spring between the first-mentioned spring and the ground-plate, mounted flatwise on the ground-plate and insulated therefrom and from the first-mentioned spring, a pair of superposed springs outside of the first-mentioned spring and mounted flatwise on the ground-plate but insulated therefrom and from each other, the inner spring of the said pair being conductively secured to the first-mentioned spring, one spring of the pair being held stationary, the other spring of the pair being movable, a fifth spring outside of the said pair of springs, mounted flatwise on the ground-plate and insulated from the ground-plate and from the other said springs, at its fixed end, and making contact with the outer spring of the pair at its free end, a lightning-arrester inserted between the free end of the first-mentioned spring and the ground-strip, and a protective device held in a state of stress between the said pair of springs, the giving away of the protective device, due to an abnormally large current therein, causing the movable spring of the pair to ground itself and the second-mentioned spring, substantially as described.

11. In protective apparatus, the combination with a ground-plate, of a ground-strip secured to one edge thereof, a spring mounted flatwise on the ground-plate and insulated therefrom, a second spring interposed between the first-mentioned spring and the ground-plate, mounted flatwise on the ground-plate and insulated therefrom and from the first-mentioned spring, a pair of superposed springs outside of the first-mentioned spring and mounted flatwise on the ground-plate but insulated therefrom and from each other, the inner spring of the said pair being conductively secured to the first-mentioned spring, one spring of the pair being provided with a projection thereon adapted to make contact with the other spring of the pair, and another projection thereon adapted to make contact with the second-mentioned spring, which is adapted to make contact with the ground-plate, one spring of the pair being held stationary, the other spring of the pair being movable, a fifth spring outside of the said pair of springs, mounted flatwise on the ground-plate and insulated therefrom and from the other said springs, at its fixed end, and making contact with the outer spring of the pair at its free end, the said fifth spring being split at its free end to form two points of contact, a lightning-arrester inserted between the free end of the first-mentioned spring and the ground-strip, and a protective device held in a state of stress between the said pair of springs, the giving away of the protective device, due to an abnormally large current therein, causing the movable spring of the pair to throw a ground on all of the springs of the combination, substantially as described.

12. In protective apparatus, the combination with a ground-plate, of a ground-strip secured to one edge thereof and suitably arranged to accommodate lightning-arresters, a spring mounted flatwise on the ground-plate and insulated therefrom, a pair of superposed springs outside of the first-mentioned spring and mounted flatwise on the ground-plate but insulated therefrom and from each other, the inner spring of the pair being conductively secured to the first-mentioned spring, one spring of the pair being held stationary, the other spring of the pair being movable, a projection on one spring of the pair adapted to make connection between the two springs of the pair, a projection on one spring of the pair adapted to make electrical connection with the ground-plate, a fourth spring outside of the said pair of springs, mounted flatwise on the ground-plate and insulated therefrom and from the other springs at its fixed end, and making contact with the outer spring of the pair at its free end, the said fourth spring being split at its free end to form two points of contact, a lightning-arrester inserted between the free end of the first-mentioned spring and the ground-strip, and a protective device held in a state of stress between the said pair of springs, the giving away of the protective device, due to an abnormally large current therein, causing the movable spring of the pair to ground all of the springs of the combination, substantially as described.

13. In protective apparatus, the combination with a ground-plate, of double-ended bolts extending therethrough and insulated therefrom and from each other, ground-strips secured to one edge of the ground-plate and held against each other, a pair of superposed springs on each side of the ground-plate and mounted flatwise on the ground-plate by the said bolts, the said springs being insulated from the ground-plate and from each other, one spring of each pair being held stationary, the other spring of each pair being movable, a protective device for each pair of springs and held in a state of stress thereby, a third spring for each pair, mounted flatwise on the ground-plate between the latter and the respective pairs of springs, by the said bolts, the said third springs being conductively secured to the respective inner springs of the pairs, lightning-arresters inserted between the respective third springs and the ground-strips, a fourth spring for each pair, mounted flatwise on the ground-plate by the said bolts, outside of the respective pairs of springs, the said fourth springs making contact with the respective outer springs of the pairs at their free ends, and being insulated from the said pairs at their fixed ends, and a terminal spring for each side of the ground-plate and mounted thereon by the said bolts, but insulated from the ground-plate and from each other, one of the said terminal springs and the opposite said third spring being conductively secured to one said bolt, the other said terminal spring and its opposite said fourth spring being conductively secured to the other said bolt, this "changing over" of the springs being done to put the connection-terminals for both said third springs on one side of the ground-plate, and the connection-terminals for both said fourth springs on the other side of the ground-plate, the giving away of the protective devices, due to abnormally large currents therein, causing the movable springs of the respective pairs to ground themselves and their respective third springs, substantially as described.

14. In apparatus of the class specified, the combination of a thimble, an excess-current-operable device contained within the thimble, means for engaging a portion of the said device and tending to turn same within the thimble, and means for turning the said device within the thimble, to an operative position, after operation.

15. In apparatus of the class specified, the combination of a device operable upon an excess of current and comprising a conducting member normally secured in place by heat-susceptible material, a thimble in the nature of a spring adapted to grasp the said device and firmly hold same therein, means for engaging the said conducting member and tending to turn the said device within the thimble, the said conducting member releasing its engaging means when the heat-susceptible material is softened, and means for turning the said device within the thimble to reset the apparatus.

16. In apparatus of the class specified, the combination of a spring member formed into a thimble at one end thereof, a thermal protector contained within the thimble and firmly held against rotation by the latter, a conducting member electrically connected with the protector and held in an operative position by heat-susceptible material, a second spring member adapted to engage the said conducting member and tending to turn the said device within the thimble, the said second spring member being released by the said conducting member when the protector operates, and thereby controlling a circuit, and means adapted to engage the said conducting member and thereby turn the protector within the thimble, to an operative position, when the apparatus is reset, substantially as described.

17. In protective apparatus for electric circuits, the combination with a ground-plate, of a ground-strip secured thereto, a series of lightning-arresters held against the ground-strip, a series of spring-supports adapted to hold the respective lightning-arresters in place, a second series of springs conductively connected with the respective springs of the first series, a third series of springs forming pairs with the respective springs of the second series, a series of thermal protectors held in a state of stress between the respective pairs of springs, a fourth series of springs adapted to normally engage the respective springs of one series forming the pairs, and means for grounding one spring of any pair upon the operation of its protector.

18. In apparatus of the class specified, an electric protective device, a thimble adapted to grasp the said device and normally hold same in a fixed position, means adapted to engage the device and tending to operate same, the operation of the device causing a circuit to be controlled, and means adapted to move the said device within the thimble to operative position after operation.

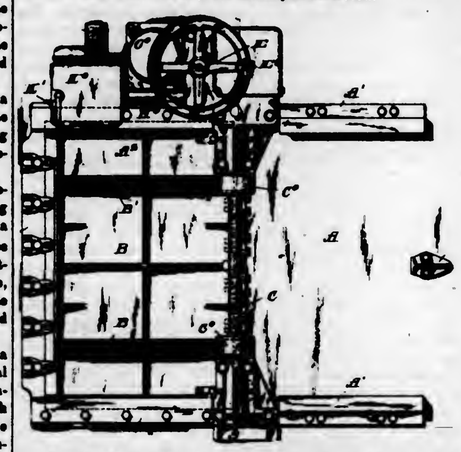
19. In apparatus of the class specified, a device operable upon an excess of current in the circuit, means for holding same in an operative position, means for turning a portion of the device under abnormal conditions, to control a circuit, and means for turning the device as a whole to an operative position after operation.

20. In apparatus of the class specified, a device operable upon an excess of current in the circuit, means for holding same in an operative position, means for operating the device under abnormal conditions, and means for turning the device as a whole to an operative position after operation.

21. In apparatus of the class specified, a device operable upon an excess of current in the circuit, means for holding same in an operative position, means for turning the central portion thereof under abnormal conditions, to control a circuit, and means for turning the device as a whole to an operative position after operation.

810,915. AUTOMATIC CUT-OUT MECHANISM FOR ELECTRICALLY-OPERATED BULKHEAD-DOORS. WILLIAM B. COWLES, Cleveland, Ohio, assignor to The "Long Arm" System Company, Cleveland, Ohio, a Corporation of Ohio. Filed July 11, 1904. Serial No. 216,143.

Claim.—1. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.



2. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

3. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

4. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

5. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to a member of said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

6. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller con-

nected to a member of said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

7. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

8. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

9. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

10. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

11. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit in either direction, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

12. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

13. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

14. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

15. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to said worm-wheel, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, in either direction, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

16. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

17. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said track or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, means for adjusting the compression of said spring, and a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

18. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

19. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cam-sleeve controlled by the yielding of said arm against said spring, and a cut-out switch operated by said cam-sleeve, for cutting off the current from said motor, substantially as described.

20. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit in either direction, a cam-sleeve, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, and means controlled by the motion of said cam-sleeve due to the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

21. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, and a cut-out switch controlled by the motion of said cam-sleeve due to the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

22. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve movable longitudinally on said shaft, cam-lugs connected to said worm-wheel and said cam-sleeve, and a cut-out switch controlled by the motion of said cam-sleeve due to the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

23. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve movable longitudinally on said shaft, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, and means controlled by the motion of said cam-sleeve due to the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

24. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for supporting said spring and for adjusting the compression thereof, a lug or roller connected to said worm-wheel, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, in either direction, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

25. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, telescopic members pivoted to said arms, respectively, a coil-spring under compression mounted between said arms over said telescopic members, a screw for adjusting the compression of said spring, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

26. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, telescopic members pivoted to said arms, respectively, a coil-spring under compression mounted between said arms and inclosing said telescopic members, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a screw connecting said telescopic members for adjusting the compression of said spring, and a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, substantially as described.

27. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, telescopic members connecting said arms, a coil-spring under compression mounted between said arms, and inclosing said telescopic members, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, and means controlled by the yielding of said arm against said spring for cutting off the current from said motor, substantially as described.

28. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, means controlled by the yielding of said arm against said spring for cutting off the current from said motor, and means for operating said gearing by hand from either side of the bulkhead, when desired, substantially as described.

29. In a system of the character described, the combination with a door or hatch, of an electric motor, and gearing driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, means for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, a cut-out switch controlled by the yielding of said arm against said spring for cutting off the current from said motor, and means for operating said gearing by hand from either side of the bulkhead, when desired, substantially as described.

30. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with pinions meshing in said racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a cut-out switch controlled by the yielding of said arm against said spring, for cutting off the current from said motor, and means for operating said gearing by hand from either side of the bulkhead, when desired, substantially as described.

31. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with pinions meshing in said racks, of an electric motor, and gearing driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to a member of said gearing and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, means controlled by the yielding of said arm against said spring, for cutting off the current from said motor, and means for operating said gearing by hand from either side of the bulkhead, substantially as described.

32. In a system of the character described, the combination with a door, of an electric motor, and gearing driven by said motor for operating the door, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for adjusting the compression of said spring, a lug or roller connected to said gearing, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve controlled by the yielding of said arm against said spring, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said arm, for cutting off the current from said motor, substantially as described.

33. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit in either direction, a cam-sleeve, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said arm, for cutting off the current from said motor, substantially as described.

34. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said

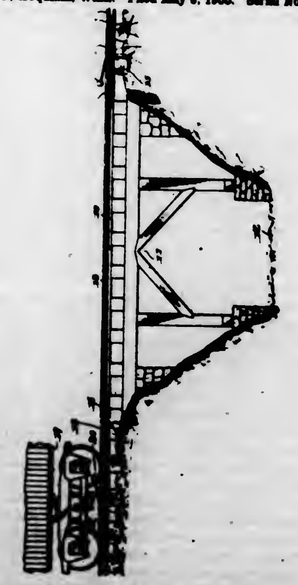
arm, for cutting off the current from said motor, substantially as described.

36. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve movable longitudinally on said shaft, cam-lugs connected to said worm-wheel and said cam-sleeve, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said arm, for cutting off the current from said motor, substantially as described.

36. In a system of the character described, the combination with a door or hatch, a rack or racks secured thereto, and a shaft with a pinion or pinions meshing in said rack or racks, of an electric motor, and a worm-wheel mounted on said shaft and driven by said motor for turning said shaft, arms pivotally mounted on said shaft and a stop for said arms, a spring under compression mounted between said arms, a lug or roller connected to said worm-wheel and forcing one or the other of said arms against the action of said spring when the load on said gearing exceeds a predetermined limit, a cam-sleeve movable longitudinally on said shaft, cam-lugs connected to said worm-wheel and engaging said cam-sleeve, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said arm, for cutting off the current from said motor, substantially as described.

37. In a system of the character described, the combination with a door or hatch, of an electric motor, and a worm-wheel driven by said motor for operating the door or hatch, pivoted arms with a stop therefor, a coil-spring under compression mounted between said arms, a telescopic joint for supporting said spring and for adjusting the compression thereof, a lug or roller connected to said worm-wheel, and forcing one or the other of said arms against said spring when the load on said gearing exceeds a predetermined limit, in either direction, a pivoted arm rocked by said cam-sleeve and a cut-out switch operated by said arm, for cutting off the current from said motor, substantially as described.

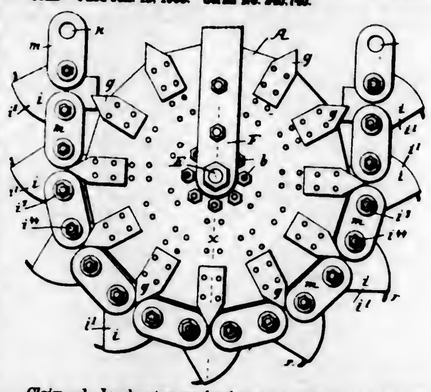
810,916. RAILWAY-TRAIN-STOPPING DEVICE. SHERMAN L. CRAWFORD, Hoquiam, Wash. Filed May 6, 1905. Serial No. 259,471.



Claim.—1. A brake-operating device comprising a brake-trip pivoted upon the track, a frangible body associated with the track, a line connected at one end to the brake-trip and at the other to the frangible body and arranged to hold the trip out of the path of the brake mechanism means whereby the frangible body is fractured and the trip released when the track is dislocated and means to raise the trip when released.

2. A brake-operating device comprising a brake-trip and weighted operating-lever pivoted upon the track, a frangible body associated with the track and arranged to be fractured by a dislocation thereof, and a line connected at one end to the frangible body and at the other to the trip and arranged to hold the trip out of the path of the brake mechanism while the frangible body is intact and to permit the trip to rise when the frangible body is broken.

810,917. CONVEYER-SCOOP. WILLIAM CROSSLEY, West Haven, Conn. Filed Jan. 13, 1906. Serial No. 240,749.



Claim.—1. In elevator mechanism a conveyer-scoop comprising in combination a pair of ends or heads and a body part or shell composed of longitudinal staves connecting and secured to the heads substantially in the manner and for the purpose specified.

2. In a dredging-machine or digger a conveyer-scoop comprising in combination a pair of ends or heads each provided with a pair of flanges around its periphery, forming an intervening groove at right angles to the plane of the head, and a series of longitudinal staves or sections forming the body part or shell of the scoop having their ends secured in the grooves of the heads and connecting the heads, substantially in the manner and for the purpose specified.

3. In elevator mechanism, the combination of a pair of ends or heads, each provided with pairs of flanges and intervening grooves, and a body part or shell having its ends received in the grooves of the heads and secured thereto by pins driven through the flanges and shell, substantially as and for the purposes specified.

4. In a dredging-machine or elevator mechanism the herein-described conveyer-scoop comprising in combination the pair of ends or heads i' each provided with the pairs of flanges i⁶ around its periphery, and the series of staves or longitudinal sections r having their ends received in the grooves between the flanges and secured thereto by pins driven through the flanges and the ends of the staves, substantially in the manner and for the purpose specified.

810,918. DOOR-BOLT. EDGAR W. CUNNINGHAM, Roselle, N. J. Filed May 6, 1905. Serial No. 259,694.

Claim.—1. A door-bolt comprising a casing, a reciprocable bolt therein, a spring in the casing and adapted to force said bolt in one direction, a link pivoted to said bolt and lying within the casing, an operating-lever pivoted on said casing, and having one of its ends extending into the bolt-cavity, said inward-extending end being pivoted to the free end of the link, a finger-piece on the opposite end of said lever, and stops adapted to be engaged by said finger-piece at the extremes of its movements, one of said stops being so located that when it is engaged by the finger-piece the spring will be compressed and the pivotal point between the link and the lever will be on one side of a line running through the pivot of the lever and the connection between the link and the bolt, whereby the pressure of the spring will hold the finger-piece against the stop and the movement of the bolt will be prevented.

2. A door-bolt comprising a casing, a reciprocable bolt therein, a spring surrounding said bolt and normally holding it retracted, a link pivoted to said bolt and lying within the casing, an operating-lever pivoted on said casing, and having one of its ends extending into the bolt-cavity, said inward-extending end being pivoted to the free end of the link, a finger-piece on the opposite end of said lever, and stops adapted to be engaged by said finger-piece at the extremes of its movements, one of said stops being so located that when it is engaged by the finger-piece the spring will be compressed and the bolt will be projected beyond the casing and the pivotal point between the link and the lever will be on one side of a line running through the pivot of the lever and the connection between the link and the bolt, whereby the pressure of the spring will hold the finger-piece against the stop and the movement of the bolt will be prevented.

810,919. AUTOMATIC LOCKING DEVICE FOR LOOSE-LEAF BINDERS. GEORGE T. DALTON, Sr., Washington, D. C., assignor to Joseph B. Dalton, Washington, D. C. Filed Mar. 16, 1905. Serial No. 250,495.

Claim.—1. A locking device for sectional backs for books comprising, in combination with the hinged plates of the back, one of said plates provided with a slot with an enlarged portion a link pivotally connected to one of said plates, a projection upon said link adapted to travel in a slot in the other of said plates, and means for holding said pin in an enlarged portion of said slot, as set forth.

2. In combination with the hinged plates of the back of a book, one of said plates having an elongated slot terminating in an enlarged portion, a link pivoted to the other plate and provided with a longitudinal flange, a pin carried by said link and guided in said slot, and means for holding said pin in the enlarged portion of said slot, as set forth.

3. In combination with the hinged plates of the back of a book, one of said plates having an elongated slot terminating in an enlarged portion, a link pivoted to the other plate and provided with a longitudinal flange, a pin carried by said link and guided in said slot, and a spring secured adjacent to said slot and adapted to hold said pin in said enlarged portion of the slot, as set forth.

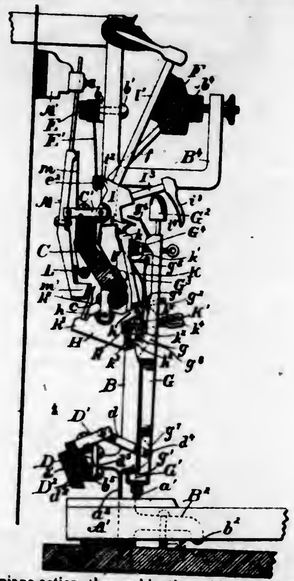
4. In combination with the hinged plates of the back of a book, one of said plates being provided with an inclined slot having an enlarged portion at one end, a link pivoted to the other plate and provided with a longitudinal flange, a pin carried by said link and mounted in said slot and designed to bear frictionally against the marginal edge of the slot to assist in throwing the plates in opposite directions, and a spring secured adjacent to said slot and designed to hold said pin in the enlarged portion of the slot, as set forth.

810,920. PIANO-ACTION. JOHN W. DARLEY, Jr., Baltimore, Md., assignor of one-half to Michael Heilmann, Philip Hamburger, and Leon Hamburger, Baltimore, Md. Filed Nov. 27, 1901. Serial No. 83,912.

Claim.—1. In a piano-action, the combination with a series of frames supporting the several parts of the piano-action, and having feet with rounded heels, and shoulders at the base of said heels, and toes on the said feet; of a base-board having holes to receive the rounded portion of the said heels, and depressions to receive the toes, and means for securing said frames in an upright position, substantially as described.

2. In a piano-action, the combination with a series of frames supporting the several parts of the piano-action, and having feet with rounded heels, and shoulders at the base of said heels, and toes on the said feet; of a base-board having holes to receive the rounded portion of the said heels, and depressions to receive the toes, the relation of the said heels and toes and holes and depressions being such that when the frames are in an upright position the frames will rest upon the shoulders at the base of the heels with the toes slightly above their corresponding depressions, allowing the frames to be tilted forwardly, and means for securing the frames in an upright position, substantially as described.

3. In a piano-action, the combination with the supporting-frames, of a rail D secured to said frames directly above the rear ends of the keys, a key-rail D^4 adjustably secured to said rail D, and projecting below the latter, padding along the lower edge of said key-rail adapted to act as an abutment for the ends of the keys, and screws countersunk in the rail D and entering the rail D^4, substantially as described.



4. In a piano-action, the combination with a jack-lever, and a link having a pin rigidly secured therein; of an abstract guided by said jack-lever and link and having an elongated slot to receive said pin, and bushing in said slot, whereby said abstract may have slight lateral play without twisting movement, substantially as described.

5. In a piano-action, the combination with a jack-lever, and a link having a pin rigidly secured therein; of an abstract guided by said jack-lever and link and having a pin rigidly secured in said abstract and passing through a hole containing a bushing in said jack-lever, said abstract having an elongated slot to receive the pin in said link and bushing in said slot whereby said abstract may have slight lateral play without twisting movement, substantially as described.

6. In a piano-action, the combination with the supporting-frames, and the keyboard; of a rail secured to said supporting-frames above the rear end of the keys and provided with vertically-disposed slots, a key-rail, a strip of padding along the lower edge of the key-rail, and screws passing through said slots into said key-rail for adjustably securing the same in position above the rear ends of the keys.

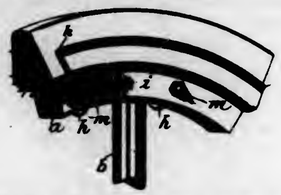
7. In a piano-action, the combination with the frames supporting the piano-actions, and the keyboard; of a rail or bar supported by said frames near their lower ends, a pivot-block secured upon the top of said rail, an abstract having its lower end in proximity to said block, a link connecting said block and abstract, a key-rail, padding upon the under side of said key-rail, and screws passing through vertically-disposed slots in said rail and entering said key-rail to adjustably secure the same above the rear ends of the keys.

810,921. TIRE FOR VEHICLE-WHEELS. ARSENEUS DAVIS, New York, N. Y. Filed July 29, 1905. Serial No. 270,471.

Claim.—1. A solid tire for vehicle-wheels, composed of a flexible material, adapted to be seated on the periphery of a wheel-felly, and a retaining strip or core having a plurality of undercut recesses formed in each of its two side edges, embedded in the flexible material so as to be wholly within or above the base or seating portion of the flexible tire and adapted to receive the threaded portions of screws passed through the felly of the wheel.

2. A solid tire for vehicle-wheels, composed of a flexible material and a retaining-strip consisting of compacted layers of fabric and

a vulcanizable material having a plurality of undercut recesses in each of its two edges, embedded in the base of the flexible material wholly within or above the seating-surface thereof and welded thereto by vulcanizing process, said retaining-strip being adapted to receive the threaded portions of holding-screws.



3. In combination, the felly of a wheel, a flexible tire adapted to seat on the periphery of the felly and having the lower parts of its sides formed to extend beyond the sides of the felly; a retaining strip or core with a plurality of undercut recesses at its sides embedded in the seating side of and welded by vulcanization to the flexible tire; side flanges adapted to grip the side extensions of the flexible tire; means for clamping the side flanges to the felly; and screws passed radially through the felly into the retaining strip or core of the flexible tire.

4. A solid flexible tire having embedded wholly within its lower or seating side a non-compressible retaining-strip formed with a plurality of undercut recesses in each of its side edges; a felly on which the flexible tire by its flat base is seated; and side flanges secured to the felly and shaped to clamp the sides of the flexible tire, the distance between the clamping-faces of the flanges and the outer points of the two or more undercut recesses on the two sides of the retaining-strip being less than the distances between said clamping-faces and the inner parts of said recesses.

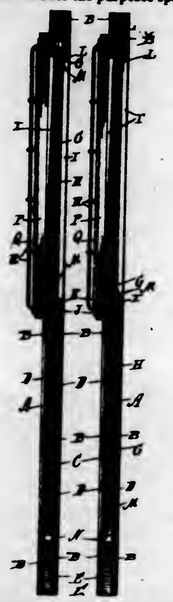
810,922. COAL-SCREEN. ELSA R. DICKEY, Dugger, Ind. Filed Oct. 31, 1904. Serial No. 230,513.

Claim.—1. A coal-screen comprising a frame provided with sifting mechanism, and legs pivotally connected to the sides of the frame and of unequal length to give an inclination to the screen, and having longitudinal edge portions bent to provide flanges to engage with the lower edges of the screen-frame sides to limit the folding of said legs when turned up against the sides of the frame, the ends of the flanges adjacent their pivotal ends forming stop-shoulders to engage with the lower edge portions of the side pieces of the frame to limit the movement of the legs when unfolded, substantially as set forth.

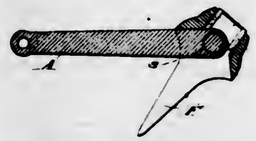
2. A coal-screen comprising side pieces and transverse connecting-bars, a transverse rod 7 at one end of the frame, longitudinal bars 8 transversely spaced and having slots at one end to receive the rod 7 and having their opposite ends deflected downwardly and secured to an end bar of the frame opposite to the rod 7, a compound crank-shaft, and other longitudinal bars 9 arranged between the bars 8 and having inclined slots at one end to receive the rod 7 and having their opposite ends mounted upon the crank portions of said crank-shaft, the upper edges of the bars 8 and 9 being toothed.

810,923. DOOR. JOHN D. DOEHLMAN, Chicago, Ill. Filed July 17, 1905. Serial No. 270,071.

Claim.—In a door of the kind described, the combination consisting of a main body formed of the stiles A, rails B, the center rail B having bevel edge J and a lip K, panels D, and inclined pieces B; a pair of bushings T fixed in one of said stiles; a window-sash G supporting a window-glass H; said sash being adapted to be moved vertically in said main body; means for supporting said sash in a closed or open position in said main body; a frame P pivotally supported on the upper outside part of said main body and adapted to be swung open horizontally; a pair of spring-catches fixed to said frame and adapted to enter said bushings and to thereby lock said frame to said main body; a wire screen Q fixed on said frame; and a metallic guard covering said screen and affixed to said frame, substantially as described and for the purposes specified.

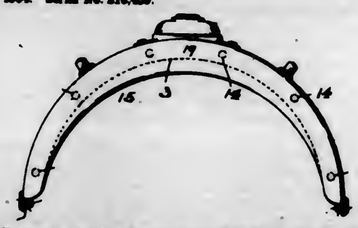


810,924. ANCHOR. HERBERT O. DUNN, Baltimore, Md. Filed Nov. 7, 1904. Serial No. 231,674.



Claim.—In an anchor the combination of a shank provided with trunnions with a crown provided with central opening to receive said shank and dovetailed recesses on each side to receive said trunnions the metal of said crown surrounding said recesses extending beyond the same before the anchor is assembled, and filling-pieces fitting said recesses to secure said trunnions, the filling-pieces held in place by swaging down said metal substantially as set forth.

810,925. BAG-FRAME. BRUNO VON BIDDER, Newark, N. J., assignor to Aug. Goerts & Co., Newark, N. J., a Firm. Filed July 14, 1904. Serial No. 216,469.



Claim.—1. In a bag-frame, the combination, with the hinged or pivoted main frame-sections, of a separate front cover-section conforming to and arranged upon the outer face of one of said main frame-sections, said cover-section serving as a rivet-head-concealing means, substantially as and for the purposes set forth.

2. In a bag-frame, the combination, with a pair of hinged or pivoted main frame-sections, of an independent front cover-section

arranged upon the outer face of one of said frame-sections to conceal the rivet-heads by means of which the frame-section is attached to the mouth of a bag, and means for securing said front cover-section upon said main frame-section, substantially as and for the purposes set forth.

3. In a bag-frame, the combination, with a pair of hinged or pivoted main frame-sections, of an independent front cover-section arranged upon the outer face of one of said frame-sections to conceal the rivet-heads by means of which the frame-section is attached to the mouth of the bag, and centering devices connected with the said front cover-section and the bag-frame section upon which the said front cover-section is arranged to prevent lateral movement of said front cover-section upon the frame-section, substantially as and for the purposes set forth.

4. In a bag-frame, the combination, with a pair of hinged or pivoted bag-frame sections, of an independent front cover-section arranged upon one of said frame-sections to conceal the rivet-heads by means of which the frame-section is attached to the mouth of a bag, and centering devices connected with the said front cover-section and the bag-frame section upon which the said front cover-section is arranged to prevent lateral movement of said front cover-section upon the frame-section, consisting, of downwardly-extending lugs on said front cover-section in engagement with portions of the said frame-section, substantially as and for the purposes set forth.

5. A bag-frame comprising a pair of main frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section upon the outer face of one of said frame-sections, pintle-receiving lugs connected with said front cover-section, and connecting-pintles in the receiving-lugs of said front cover-section and said frame-sections, substantially as and for the purposes set forth.

6. A bag-frame comprising a pair of main frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section upon the outer face of one of said frame-sections, pintle-receiving lugs connected with said front cover-section, connecting-pintles in the receiving-lugs of said front cover-section and said frame-sections, and centering devices connected with the said front cover-section and the bag-frame section upon which said front cover-section is arranged to prevent lateral displacement of the said front cover-section upon said frame-section, substantially as and for the purposes set forth.

7. A bag-frame comprising a pair of frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section upon one of said frame-sections, pintle-receiving lugs connected with said front cover-section, connecting-pintles in the receiving-lugs of said front cover-section and said frame-sections, and centering devices connected with the said front cover-section and the bag-frame section upon which said front cover-section is arranged to prevent lateral displacement of the said front cover-section upon said frame-section, consisting, of downwardly-extending lugs on said front cover-section in engagement with portions of the said frame-section, substantially as and for the purposes set forth.

8. A bag-frame comprising a pair of hinged or pivoted main frame-sections, and a rivet-head-concealing cover-section arranged upon and separably and detachably connected with the outer face of one of said frame-sections, substantially as and for the purposes set forth.

9. A bag-frame comprising a pair of hinged or pivoted main frame-sections, a holding-catch rigidly fixed upon one of said frame-sections, a rivet-head-concealing cover-section arranged upon and separably and detachably connected with the outer face of the other frame-section, and a bag-frame fastener fixed upon said front cover-section capable of receiving the holding-catch for locking the frame-sections in their closed relation, substantially as and for the purposes set forth.

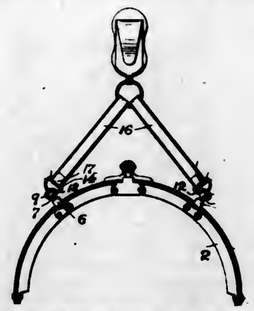
10. A bag-frame comprising a pair of main frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section conforming to and arranged upon the outer face of one of said frame-sections, pintle-receiving lugs connected with said front cover-section, and pintles in the receiving-lugs of said front cover-section and said frame-sections, each pintle comprising a pair of shanks having bent end portions, substantially as and for the purposes set forth.

11. A bag-frame comprising a pair of main frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section conforming to and arranged upon the outer face of one of said frame-sections, pintle-receiving lugs connected with said front cover-section, and pintles in the receiving-lugs of said front cover-section and said frame-sections, each pintle comprising a pair of shanks having bent end portions, all combined with centering devices connected with the said front cover-section and the bag-frame section upon which the said cover-section is arranged to prevent lateral displacement of said front cover-section upon said frame-section, substantially as and for the purposes set forth.

12. A bag-frame comprising a pair of frame-sections, each frame-section being provided with pintle-receiving lugs, an independent front cover-section upon one of said frame-sections, pintle-receiving lugs connected with said front cover-section, and pintles in the receiving-lugs of said front cover-section and said frame-sections, each pintle comprising a pair of shanks having bent end portions, all combined with centering devices connected with the said front cover-section and the bag-frame section upon which the said cover-section is arranged to prevent lateral displacement of said front cover-section upon said frame-section, consisting, of downwardly-extending lugs on said front cover-section in engagement with portions of the said frame-section, substantially as and for the purposes set forth.

13. A bag-frame comprising a pair of hinged or pivoted frame-sections, one of said frame-sections having receiving depressions in its marginal edge, a rivet-head-concealing cover-section upon said frame-section, and lugs upon said cover-section registering with the receiving depressions of said frame-section, substantially as and for the purposes set forth.

810,926. HANDLE OR STRAP ATTACHMENT FOR BAG-FRAMES. BRUNO VON BIDDER, Newark, N. J., assignor to Aug. Goerts & Co., a Corporation of New Jersey. Filed Oct. 5, 1905. Serial No. 281,411.



Claim.—1. An attachment or fixture for bag handles or straps, comprising a fastening loop or eye for securing the attachment or fixture to a post, and a reënforcing or stiffening means connected with said fastening loop or eye to prevent spreading of said loop or eye, substantially as and for the purposes set forth.

2. An attachment or fixture for bag handles or straps, comprising, a fastening loop or eye for securing the attachment or fixture to a post, and a reënforcing or stiffening means integrally connected with said fastening loop or eye to prevent spreading, said reënforcing or stiffening means being provided with an angularly-arranged and downwardly-extending bar for attachment thereto of the end of a strap member, substantially as and for the purposes set forth.

3. An attachment or fixture for bag handles or straps, comprising, a pair of integrally-connected loops or eyes, one of said loops or eyes being adapted for attachment to a post, and a straight and angularly-arranged and downwardly-extending bar connected with the other loop or eye for attachment thereto of the end of a strap member, substantially as and for the purposes set forth.

4. An attachment or fixture for bag handles or straps, comprising a pair of integrally-connected loops or eyes, pivots or journal portions on one of said loops or eyes for pivotal attachment of the fixture to a post, and the other loop or eye being adapted for attachment thereto of the end of a strap member, substantially as and for the purposes set forth.

5. An attachment or fixture for bag handles or straps, comprising a pair of integrally-connected loops or eyes, pivots or journal portions on one of said loops or eyes for pivotal attachment of the fixture to a post, and a straight and angularly-arranged and downwardly-extending bar connected with the other loop or eye for attachment thereto of the end of a strap member, substantially as and for the purposes set forth.

6. An attachment or fixture for bag handles or straps, comprising an arc-shaped member, means extending from said member for

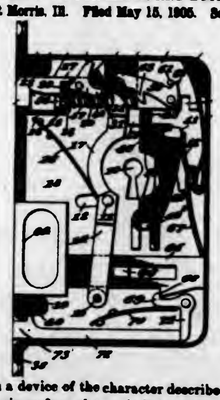
attachment to a post, a pair of upwardly-projecting arms extending from said arc-shaped member, and a bar between the said arms for attachment to said bar of the end of a strap member, substantially as and for the purposes set forth.

7. An attachment or fixture for bag handles or straps, comprising an arc-shaped member, means extending from said member for attachment to a post, a pair of upwardly-projecting arms extending from said arc-shaped member, one of said arms being longer than the other arm, and a straight bar between the said arms for attachment to said bar of the end of a strap member, substantially as and for the purposes set forth.

8. An attachment or fixture for bag handles or straps, comprising an arc-shaped member, oppositely-arranged and inwardly-extending pivots or journals connected with said arc-shaped member, for pivotal attachment of said fixture to a post, a pair of upwardly-projecting arms extending from said arc-shaped member, and a bar between the said arms for attachment to said bar of the end of a trap member, substantially as and for the purposes set forth.

9. An attachment or fixture for bag handles or straps, comprising an arc-shaped member, oppositely-arranged and inwardly-extending pivots or journals connected with said arc-shaped member, for pivotal attachment of said fixture to a post, a pair of upwardly-projecting arms extending from said arc-shaped member, one of said arms being longer than the other arm, and a straight bar between the said arms for attachment to said bar of the end of a strap member, substantially as and for the purposes set forth.

810,927. SLIDING-DOOR LATCH AND LOCK. GEORGE C. REINERT, Mount Morris, Ill. Filed May 15, 1905. Serial No. 260,367.



Claim.—1. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate and to stand, when the bolt is retracted, flush with said face-plate, a spring connected with said bolt and arranged to retract it within the casing and means for moving said bolt against the tension of the spring to throw its extremity out from the face-plate.

2. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate and to stand, when the bolt is retracted, flush with said face-plate, a spring connected with the bolt and arranged to retract it within the casing, means for moving the bolt against the tension of the spring to throw its extremity out from the face-plate and a latch-plate having means for engagement with said extremity of the bolt when thrown out of the casing to hold the bolt in latching position.

3. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate and a latch-plate having means for engagement with said extremity of the bolt when thrown out of the casing to hold said bolt in latching position.

4. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a latch-plate and spring-actuated means carried thereby for engagement with the extremity of the bolt when thrown out of the casing to hold the same in latching position.

5. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate and a latch-plate having adjustable means for engagement with said extremity of the bolt when thrown out of the casing.

6. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a latch-plate having an opening of greater size than and adapted to be traversed by said extremity of the bolt when thrown out of the casing and a plate adjustably held on said latch-plate and having means for engagement with said extremity of the bolt to hold the same in latching position.

7. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a latch-plate and a part carried thereon and movable in and out of engagement with said bolt and adapted, when engaged therewith, to hold the bolt in latching position.

8. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a latch-plate, a part carried thereon and movable in and out of engagement with said bolt and adapted, when engaged therewith, to hold the bolt in latching position and mechanism for moving said part to disengage it from the bolt to permit the same to be retracted within the casing.

9. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, a spring connected with the bolt to retract the same, means for moving the bolt against the tension of said spring to throw its extremity out from the face-plate, a latch-plate, a part carried thereon and movable in and out of engagement with said bolt and adapted, when engaged therewith to hold the bolt in latching position against the tension of said spring and mechanism for moving said part to disengage it from the bolt to permit the same to be retracted within the casing.

10. In a device of the character described, the combination of a casing, a bolt adapted to be housed therein when in retracted position, a spring connected with the bolt for retracting the same, means outside the casing and adapted for engagement with the bolt for holding it in latching position against the tension of said spring when the bolt is thrown out of the casing and mechanism adapted for successive actuation to first throw said bolt into latching position and to afterward operate said holding means to release the bolt therefrom.

11. In a device of the character described, the combination of a casing, a bolt adapted to be housed therein when in retracted position, a spring connected with the bolt for retracting the same, means outside the casing and adapted for engagement with the bolt for holding it in latching position against the tension of said spring when the bolt is thrown, means for throwing the bolt against the tension of said spring and mechanism for releasing the bolt from said holding means to permit the bolt to be retracted.

12. In a device of the character described, the combination of a casing, a bolt adapted to be housed therein when in retracted position, a spring connected with the bolt for retracting the same, means outside the casing and adapted for engagement with the bolt for holding it when thrown in latching position against the tension of said spring, means for releasing the bolt from said holding means to permit retraction of the bolt out of latching position and mechanism adapted for successive actuation first to throw the bolt against the tension of the spring and in engagement with said holding means and afterward to operate the releasing means to permit the bolt to be retracted within the casing.

13. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a striking-plate, means carried thereby for engagement with said extremity of the bolt when thrown out of the casing to hold the bolt in latching position and means for releasing the bolt from said holding means to permit retraction of the bolt out of latching position.

14. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with an extremity adapted to play through the face-plate, means for moving the bolt to throw its extremity out from the face-plate, a striking-plate, means carried thereon for engagement with said extremity of the bolt to hold the bolt in latching position when thrown, means for releasing the bolt from said holding means to permit retraction of the bolt out of latching position and a locking device engageable with said releasing means to hold the same from operation.

15. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with a hooked extremity adapted to play through the face-plate, means for moving the bolt to throw its hooked extremity out from the face-plate, a striking-plate and a spring-pressed auxiliary bolt connected therewith for engagement with the hooked end of said bolt for holding the same when thrown in latching position.

16. In a device of the character described, the combination of a casing having a face-plate, a bolt housed in the casing with a hooked extremity adapted to play through the face-plate, means for moving the bolt to throw its hooked extremity out from the face-plate, a striking-plate, a spring-pressed auxiliary bolt connected therewith for engagement with the hooked end of said bolt for holding the same when thrown in latching position and means carried by the casing and adapted to be thrown therefrom for operative engagement with the auxiliary bolt to release the same from engagement with said bolt to permit the same to be retracted within the casing.

17. In a device of the character described, the combination of a casing having a face-plate, a main bolt housed in the casing with a hooked extremity adapted to play through the face-plate, means for moving said main bolt to throw its hooked extremity out from the face-plate, a striking-plate, a spring-pressed auxiliary bolt connected with said striking-plate for engagement with the hooked end of the main bolt for holding the same when thrown in latching position and a member movable in the casing with an arm adapted, when said member is moved, to be extended through the face-plate into engagement with said auxiliary bolt to move the same to disengage it from the hooked end of the main bolt to permit the same to be retracted within the casing.

18. In a device of the character described, the combination of a casing having a face-plate, a main bolt housed in the casing with a hooked extremity adapted to play through the face-plate, a striking-plate, a spring-pressed auxiliary bolt connected therewith for engagement with the hooked end of the main bolt for holding the same when thrown in latching position, a member movable in the casing with an arm adapted, when the member is moved, to be extended through the face-plate into engagement with said auxiliary bolt to move the same to disengage it from the hooked end of the main bolt and mechanism adapted for successive actuation first to move the main bolt into latching position and afterward to move said member to throw the arm thereof into operative engagement with said auxiliary bolt for the release of the main bolt therefrom.

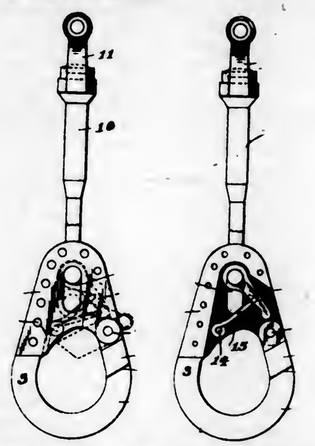
19. In a device of the character described, the combination of a casing having a face-plate, a main bolt housed therein with an extremity adapted to be thrown out from the face-plate when the bolt is moved into latching position, a dog carried by said bolt, a lever pivoted in the casing and engageable with the dog to move the bolt into latching position, an escutcheon having a movable part and a connection between said movable part on the escutcheon and said lever within the casing for moving the lever in unison with said movable part.

20. In a device of the character described, the combination of a casing, a bolt housed therein with an extremity adapted to be thrown out of the casing into latching position, a dog carried by said bolt, a lever pivoted in the casing and engageable with the dog to move the bolt into latching position, an escutcheon, an actuating-slide movably mounted on the escutcheon and provided with a socket and a projection on said lever and engaged with said socket of the actuating-slide for moving the lever in unison with said slide.

21. In a device of the character described, the combination of a casing, a bolt housed therein with an extremity adapted to be thrown out of the casing into latching position, a striking-plate an auxiliary bolt carried thereby for engagement with the extremity of the main bolt when thrown into latching position, a member guided for movement on the main bolt and within the casing and having an arm adapted, when said member is moved upon the main bolt, to be extended out from the casing in engagement with the auxiliary bolt to actuate the same for releasing the main bolt, dogs pivoted respectively upon the main bolt and upon the member movable thereon and actuating mechanism comprising a lever engageable on successive operation first with the dog of the main bolt to move the same into latching position and second with the dog of said member for moving the same to engage its arm with the auxiliary bolt for releasing the main bolt.

810,928. SAFETY-HOOK. GUSTAV FALK and WILLIAM H. PARKER, Cordell, Ill. Filed Aug. 14, 1905. Serial No. 274,242.

Claim.—1. In combination, a hook having a longitudinal slot therein, a pivoted mousing therefor, a member for supporting said hook, a pin passing transversely through the slot of the hook and connecting said supporting member therewith, said pin having an operable connection with the mousing, and a spring coacting with the mousing to normally hold the same in such a position that the mouth of the hook is closed.

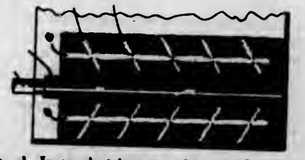


2. In combination, a hook having a longitudinal slot, a rod for supporting said hook, a pin passing transversely through the slot of the hook and thereby connecting the rod therewith, a mousing pivoted between its ends to the hook, a link connected at one end with the mousing and at its opposite end with the pin aforesaid, and a spring attached to the hook and bearing against the link aforesaid to normally hold the mousing in a position closing the mouth of the hook.

3. A safety-hook comprising a shank, spaced plates carried by the shank, a mousing pivoted between the spaced plates and normally closing the mouth of the hook, a pin slidable on the body of the hook, a link connecting said pin with the mousing, and a rod connected with the pin aforesaid.

4. A safety-hook comprising a shank formed with a suitable bill, plates secured to opposite sides of the shank and in spaced relation, a mousing pivoted between its ends between said plates, a spring arranged between the plates, a link connected with an end of the mousing and with the spring, said mousing being held normally closed by the spring, the body of the hook having a slot therein, a pin passing through said slot and connected with the link aforesaid, and a rod connected with the pin for actuation thereof, as specified.

810,929. STORAGE BATTERY. WILLIAM PENNELL and WILLIAM P. PERRY, Leytonstone, England. Filed Mar. 17, 1904. Serial No. 198,846.



Claim.—1. In an electric accumulator, a honeycombed mass, an active material on the exposed surfaces of the mass, and unobstructed passage-ways formed therein besides the interstices of the mass for the egress of gas.

2. In electric accumulators, a honeycombed mass, an active material on the exposed surfaces of the mass, and communicating unobstructed passage-ways formed therein besides the interstices of the mass for the egress of gas.

3. In electric accumulators, a honeycombed mass, an active material on the exposed surfaces of the mass, and unobstructed passage-ways formed therein besides the interstices of the mass, certain of said passage-ways being inclined for the egress of gas.

810,930. STORAGE BATTERY. WILLIAM PERRELL and WILLIAM P. PERRY, Leytonstone, England. Filed Mar. 6, 1905. Serial No. 248,778.

Claim.—1. An electrode comprised of a non-conducting mass insoluble in electrolyte pierced in more than one direction with intercommunicating passages, the walls of the passages being lined with active material.

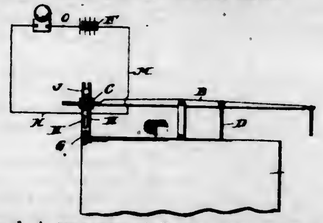
2. An improved electrode for electric accumulators consisting of a non-conducting honeycombed support on the exposed surfaces of which active material is spread in such a manner as not to fill the interstices completely.

3. An improved electrode for electric accumulators built up of a number of separate pieces of non-conductive substances, in the form of a honeycombed support on the exposed surfaces of which active material is spread so as not to fill the interstices completely.

4. An improved electrode for electric accumulators consisting of a non-conducting support pierced by intercommunicating passages on the walls of which active material is spread so as not to fill the interstices completely.

5. An improved electrode for electric accumulators consisting of a hard rough non-conducting support pierced in different directions by intercommunicating passages, on the exposed surfaces of which active material is spread so as not to fill the interstices completely.

910,931. ALARM FOR INCUBATORS. WILLARD S. FREEMAN, St. Cloud, Minn. Filed May 6, 1905. Serial No. 259,294.



Claim.—1. A temperature-indicating alarm comprising the combination of an incubator, a thermostat contained therein, a damper-operating lever fulcrumed on said incubator, a balance-weight on one arm of said lever, a rod connecting said lever with the thermostat, a circuit-closing device secured to said incubator consisting of two slotted uprights positioned on opposite sides of said balance-weight, angular contact-plates secured in said slots above and below said weight and adjustable on said uprights, the extended portions of said plates being tapered, an alarm-signal, and a normally open circuit connecting said uprights and alarm, said weight being adapted to move between the contact-plates and close the circuit to said alarm by contacting with them, substantially as shown and described.

2. A temperature-indicating alarm comprising in combination with an incubator, a thermostat contained therein, a damper-operating lever fulcrumed on said incubator, a balance-weight on one arm of said lever, and a rod connecting said lever with the thermostat, a circuit-closing device secured to said incubator consisting of two slotted uprights positioned on opposite sides of said balance-weight, L-shaped contact-plates secured to the uprights through the slots therein above and below said weight by means of set-screws, the extended portion of said plates being tapered, an alarm-signal, and a normally open circuit connecting said uprights and alarm, said weight being adapted to move between the contact-plates and close the circuit to said alarm by contacting therewith, substantially as shown and described.

810,932. CARRIAGE-TOP. CHARLES H. GILL, Kalamazoo, Mich., assignor, by mesne assignments, of one-half to Charles H. Rickard, Kalamazoo, Mich. Filed Mar. 25, 1905. Serial No. 251,973.

Claim.—1. The combination of a bow carriage-top; a pair of inwardly-projecting headed studs on the front bow thereof; a pair of inwardly-projecting studs having buttons thereon on said front bow; a curtain; a rod or support formed of telescoping members, to which the upper edge of said curtain is secured; and curved springs having notches in their outer ends adapted to engage said headed studs, and holes therein adapted to receive said button-studs, pivotally secured to said rod members, for the purpose specified.

2. The combination of a bow carriage-top; a pair of inwardly-projecting headed studs on the front bow thereof; a pair of inwardly-projecting studs having buttons thereon on said front bow; a curtain; a rod or support to which the upper edge of said curtain is secured; and curved springs having notches in their outer ends adapted to engage said headed studs, and holes therein adapted to receive said button-studs, secured to said rod, for the purpose specified.

3. The combination of a bow carriage-top; inwardly-projecting studs on the front bow thereof; a curtain; a rod or support formed of telescoping members, to which the upper edge of said curtain is secured; and springs adapted to engage said studs pivotally secured to said rod members, for the purpose specified.

4. The combination of a bow carriage-top; inwardly-projecting studs on the front bow thereof; a curtain; a rod or support to which the upper edge of said curtain is secured; and springs adapted to engage said studs, secured to said rod; for the purpose specified.

5. The combination of a carriage-top; projecting studs on the frame thereof; a curtain; a rod or support formed of adjustably-connected members, to which said curtain is secured; and springs adapted to engage said studs pivotally secured to said members, for the purpose specified.

6. The combination of a carriage-top; projecting studs on the frame thereof; a curtain; a rod or support to which said curtain is secured; and springs adapted to engage said studs secured to said rod, for the purpose specified.

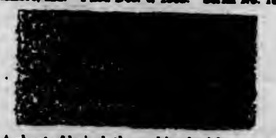
7. The combination of a bow carriage-top; a pair of inwardly-projecting headed studs on the front bow thereof; a pair of inwardly-projecting studs having buttons thereon, on said front bow; a curtain; and a rod or support formed of adjustably-connected members, to which the said curtain is secured, adapted to engage said studs under spring tension, for the purpose specified.

8. The combination of a bow carriage-top; a pair of inwardly-projecting headed studs on the front bow thereof; a pair of inwardly-projecting studs having buttons thereon, on said front bow; a curtain; and a rod or support to which the said curtain is secured, adapted to engage said studs under spring tension, for the purpose specified.

9. The combination of a carriage-top; inwardly-projecting studs on the frame thereof; a curtain; and a rod or support to which the said curtain is secured, adapted to engage said studs under spring tension, for the purpose specified.

10. The combination of a carriage-top; inwardly-projecting studs on the frame thereof; a curtain; and a rod or support formed of adjustably-connected members, to which the said curtain is secured, adapted to engage said stud under spring tension, for the purpose specified.

810,933. FABRIC CONTAINING HAIRCLOTH. GUSTAV GOLDMAN, Baltimore, Md. Filed Dec. 4, 1903. Serial No. 183,823.



Claim.—A sheet of haircloth combined with a mass of matted or felted fibers some of which project through the meshes of the cloth, and a waterproof binder uniting the haircloth and fibers together.

810,934. PROCESS OF MAKING FABRIC CONTAINING HAIRCLOTH. GUSTAV GOLDMAN, Baltimore, Md. Filed Dec. 4, 1903. Serial No. 183,823.

Claim.—1. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the haircloth, then felting the fibers in the presence of a suitable binder, and then passing through a fixing solution.

2. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the haircloth, then felting the fibers in the presence of a soap, and then passing through a fixing solution.

3. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the haircloth, then felting the fibers in the presence of a soda soap, and then passing through a fixing solution.

4. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in interposing a layer of haircloth in a fibrous mass so that the fibers project through the meshes of the cloth from both sides thereof, then felting the fibers in the presence of a suitable binder, and then passing them through a fixing solution.

5. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in interposing a layer of haircloth in a fibrous mass so that the fibers project through the meshes of the cloth from both sides thereof, then felting the fibers in the presence of a soap, and then passing them through a fixing solution.

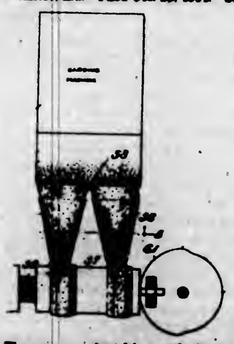
6. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in interposing a layer of haircloth in a fibrous mass so that the fibers project through the meshes of the cloth from both sides thereof, then felting the fibers in the presence of a soda soap, and then passing them through a fixing solution.

7. The process of making a fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the cloth, then rubbing the whole in the presence of a suitable binder, then passing them through a fixing solution for the binder, and then again rubbing the whole in a flat shape in the presence of heat and pressure.

8. The process of making fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the cloth, then rubbing the whole in the presence of a soap, then passing through a fixing solution for the soap, and then again rubbing the whole in a flat shape in the presence of heat and pressure.

9. The process of making fibrous material with a layer of haircloth incorporated therein, which consists in placing a sheet of haircloth in contact with a layer of fibers so that some of the fibers project through the meshes of the cloth, then rubbing the whole in the presence of a soap, then passing through an alum solution, and then again rubbing the whole in a flat shape in the presence of heat and pressure.

810,935. METHOD OF MAKING GARMENT-PADS. GUSTAV GOLDMAN, Baltimore, Md. Filed Oct. 26, 1904. Serial No. 229,973.



Claim.—1. The process of making pads from fibrous material which consists in laying down a sheet or strip of fibers in a light fluffy condition with a suitable binding material between the fibers, imparting the desired cross-sectional form to said sheet or strip, then subjecting said sheet or strip to treatment causing the binder to actively unite the fibers, and then cutting the pad therefrom.

2. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of the desired cross-sectional form with a binding material between them, then subjecting the same to treatment to render the binder actively effective for uniting the fibers, and then cutting the pad from said sheet or strip.

3. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of the desired cross-sectional shape, with a suitable binding material between the fibers, subjecting said sheet or strip to treatment to render the binder actively effective for uniting the fibers, again subjecting the sheet to a forming action before the binder has become set, and then cutting the pads from said sheet or strip.

4. The process of making pads from fibrous material, which consists in shaping the fibers into a sheet or strip of the desired cross-sectional form with a suitable binder between the fibers, subjecting the sheet or strip thus formed to heat and pressure whereby the binder is rendered actively effective for uniting the fibers, and then cutting the pads from said sheet or strip.

5. The process of making pads from fibrous material which consists in shaping the fibers into a sheet or strip of the desired cross-sectional form with a suitable binder between the fibers, treating said sheet or strip so as to render the binder actively effective for uniting the fibers, then finishing or smoothing the surface of said sheet or strip, and then cutting the pads therefrom.

6. The process of making pads from fibrous material which consists in introducing a suitable binder between the fibers, then shaping the fibers into a sheet or strip of the desired cross-sectional form, then subjecting the same to treatment for rendering the binder actively effective for uniting the fibers, and then cutting the pads from said sheet or strip.

7. The process of making garment-pads from fibrous material which consists in introducing binding material between the fibers, then laying the fibers down in the form of a sheet or strip, then imparting the desired cross-sectional form to said sheet or strip, then subjecting the same to treatment for rendering the binder actively effective for uniting the fibers, and then cutting the pads from said sheet or strip.

8. The process of making pads which consists in introducing a binding material between the fibers, then laying the fibers down in a sheet or strip, then imparting the desired cross-sectional form to the said sheet or strip, then subjecting the same to treatment to render the binder active for effectively uniting the fibers, then again subjecting the sheet or strip to further treatment for imparting the desired cross-sectional form thereto, and then cutting the pads from said sheet or strip.

9. The process of making pads which consists in laying the fibers down in a sheet or strip of the desired cross-sectional form and with a suitable binder between the fibers, subjecting said sheet or strip to treatment to render the binder active for uniting the fibers, forming transverse channels in said sheet or strip whose walls are inclined on lines corresponding to the taper of a portion of the finished pad, then forming the pads from said channeled sheet or strip.

10. The process of making pads of fibrous material which consists in shaping the fibers into a sheet or strip of the desired cross-sectional form with a suitable binder between the fibers, subjecting said sheet or strip to the action of heat and pressure whereby the binder is rendered actively effective for uniting the fibers, then finishing or smoothing the surfaces of said sheet or strip, then allowing the binder to set, then forming transverse channels with sloping walls on the surface of said sheet or strip, then cutting the pads from said channeled sheet or strip, and then finishing the surface of the pads.

11. The process of making pads from fibrous material which consists in laying down the fibers in a sheet or strip with a suitable binder between them, then forcing the fibers into the desired cross-sectional form for the sheet or strip, then subjecting said formed sheet or strip to heat and pressure whereby the binder is rendered actively effective for uniting the fibers, then subjecting the strip to further forming action before the binding material sets, then forming transverse channels with sloping walls in said sheet or strip, then cutting the pads from said channeled sheet or strip, then finishing or smoothing the surface of the pads.

12. The process of making pads from fibrous material which consists in laying down a sheet or strip of the fibers in a light fluffy condition with a suitable binder between them in the form of then

imparting the desired cross-sectional form to said sheet or strip, then subjecting the same to treatment for rendering the binder actively effective for uniting the fibers, then subjecting the surfaces of the sheet or strip to treatment for softening the binder on the surfaces, then subjecting the said sheet or strip to pressure whereby projecting fibers are forced into the softened binder on the surfaces thereby smoothing the surfaces of the strip, and then cutting the pads from said sheet or strip.

13. The process of making garment-pads from fibrous material which consists in laying the fibers down in a sheet or strip with a suitable binding material between them, imparting the desired cross-sectional form to said sheet or strip, then subjecting the same to heat and pressure for rendering the binder effective in uniting the fibers, then finishing or smoothing the surface of said sheet or strip before the binder is completely set, then allowing the binder to set, and then cutting the pads from said sheet or strip.

14. The process of making pads from fibrous material which consists in laying the fibers down in a sheet or strip with a suitable binder between them, imparting the desired cross-sectional form to said sheet or strip, subjecting the same to heat and pressure whereby the binder is rendered active for uniting the fibers, then smoothing and finishing the surface of the sheet before the binder has become fully set, then permitting the binder to set, then forming transverse channels with sloping walls in said sheet or strip, then cutting the pads from said channeled sheet or strip.

15. The process of making pads from fibrous material which consists in laying the fibers down in the form of a sheet or strip with a suitable binding material between them, imparting the desired form to said sheet or strip, subjecting it to heat and pressure for rendering the binder active for uniting the fibers, then finishing or smoothing the surface of said sheet or strip before the binder has become entirely set, then permitting the binder to set, then forming transverse channels with sloping walls in said sheet or strip, then cutting the pads from said channeled strip, and then smoothing the surfaces of the cut pads.

16. The process of forming pads from fibrous material which consists in laying the fibers down in a sheet or strip with a finely-divided resinate between them, imparting the desired cross-sectional form to said sheet or strip, then subjecting it to heat and pressure whereby the resinate is rendered active for uniting the fibers, then smoothing the surface of said sheet or strip, then forming transverse channels with sloping walls therein, and then cutting the pads from said channeled strip.

17. The process of forming pads from fibrous material which consists in laying the fibers down in a sheet or strip with a finely-divided aluminium resinate between them, then subjecting said strips to heat and pressure whereby the aluminium resinate is rendered active for binding the fibers together, then forming transverse channels with sloping walls in said sheet or strip, and then cutting the pads from said channeled strip.

18. The process of forming pads from fibrous material which consists in forming the fibers into a sheet or strip with an inert binder between the fibers, converting the binder into an active binding agent, then forming transverse channels in said sheet or strip, and then cutting the pads from said channeled sheet or strip.

19. The process of forming pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section and uniting them by a suitable binder and then cutting the pads from said sheet or strip.

20. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section, and then cutting the pads from said sheet or strip.

21. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section, then forming transverse channels in said sheet or strip, and then cutting the pads from said channeled sheet or strip.

22. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross section, then finishing the surface of said sheet or strip, and then cutting the pads therefrom.

23. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section, then forming transverse channels in said sheet or strip, then cutting the pads from the channeled sheet or strip, and then finishing the surface of the pads.

24. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section, then finishing the surface of said sheet or strip, then forming transverse channels therein, and then cutting the pads from said channeled sheet or strip.

25. The process of making pads from fibrous material which consists in forming the fibers into a sheet or strip of uneven cross-section, then finishing the surface of said sheet or strip, then forming transverse channels therein, then cutting the pads from said channeled sheet or strip, and then finishing the surface of the pads.

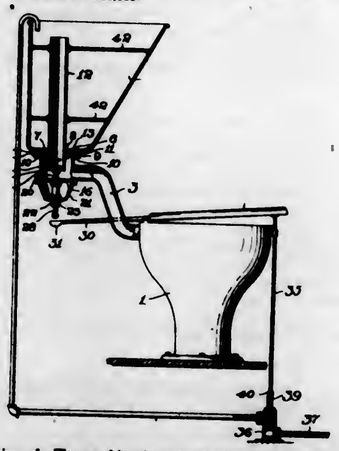
26. The process of making pads from fibrous material which consists in laying the fibers down in a light fluffy condition in the shape of a sheet or strip, then forming said sheet or strip so that it has an uneven cross-section, then making transverse channels in the sheet or strip, and then cutting the pads therefrom.

27. The process of making pads from fibrous material which consists in laying the fibers down in a light fluffy condition in the shape of a sheet or strip, then imparting an uneven cross-sectional form to the sheet or strip, then subjecting said sheet or strip to the action of heat and moisture, then again subjecting it to a forming action to further impress the uneven cross-sectional form thereon, and then cutting the pads therefrom.

28. The process of making pads from fibrous material which consists in laying the fibers down in a light fluffy condition in the shape of a sheet or strip, then imparting an uneven cross-sectional form to the sheet or strip, then subjecting said sheet or strip to the action of heat and moisture, then again subjecting it to a forming action to further impress the uneven cross-sectional form thereon, then forming transverse channels in said sheet or strip, and then cutting the pads from said channeled sheet or strip.

29. The process of making pads from fibrous material which consists in laying the fibers down in a light fluffy condition in the shape of a sheet or strip, imparting an uneven cross-sectional form to the sheet or strip, subjecting the sheet or strip to the action of heat and moisture, and then cutting the pads therefrom.

810,936. FLUSHING APPARATUS FOR OUTDOOR WATER-CLOSETS. WILLIAM U. GRIFFITHS, Philadelphia, Pa. Filed Oct. 3, 1904. Serial No. 226,880.

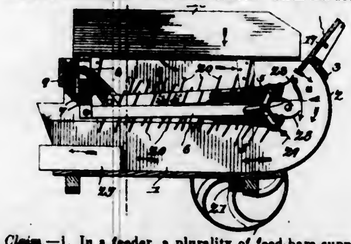


Claim.—1. The combination of a flush tank provided with an opening or port, a closet hopper, a pipe connecting the said tank and the said hopper, the said pipe having an enlargement at its upper end adjacent to the said tank, the said enlargement extending transversely of the upper end portion of the said pipe, a flexible diaphragm extending across the lower end of the said enlargement, a hollow cylinder located in the said tank, the lower end of which projects through the said port or opening into the said enlargement, the upper and lower ends respectively of the said hollow cylinder being provided with an opening, and the lower end of the said cylinder being supported upon the said diaphragm, a valve secured upon the said hollow cylinder adapted to close the said port, a closet seat having an arm which extends rearwardly underneath the lower end of the said hollow cylinder, an operating device located intermediate the said diaphragm and the rear end of said arm, whereby the said diaphragm may be lifted up by the lowering of the closet seat to occasion the closing of the said port or opening.

2. The combination of a flush tank provided with an opening or port, a closet hopper, a pipe connecting the said tank and the said hopper, a flexible diaphragm associated with said pipe, a hollow cylinder located in the said tank, the lower end of which projects through the said port or opening into the said pipe, the upper and lower ends respectively of the said hollow cylinder being provided with an opening, and the said cylinder being supported upon the said diaphragm, a valve secured upon the said hollow cylinder underneath the bottom of the said tank and being adapted to close the said port, a closet seat having an arm which extends rearwardly underneath the lower end of the said hollow cylinder, an operating device located intermediate the said diaphragm and the rear end of the said arm whereby the said diaphragm may be lifted up by the lowering of the closet seat to occasion the closing of the said port or opening.

3. The combination of a flush tank provided with an opening, a closet hopper, a pipe connecting the said tank and the said hopper, a hollow cylinder located in the said tank, the lower end of which projects through the said opening and into the said pipe, the diameter of the said cylinder being substantially less than the diameter of the said opening, the said cylinder being adapted to permit water to pass therethrough from the said tank, a valve secured upon the said cylinder underneath the bottom of the said tank and being adapted to close the said opening, a flexible diaphragm associated with the said pipe, which diaphragm is located underneath the lower end of the said hollow cylinder, a closet seat, an operating device located underneath the lower end of said diaphragm, and means interposed between the said closet seat and the said operating device, whereby upon lowering the said closet seat the said device is operated to occasion movement of the said diaphragm, the movement of the latter occasioning movement of the said cylinder and valve to close the said opening.

810,937. FEEDER FOR CLOVER-HULLERS. HUGO GUDERIAN, Good Thunder, Minn. Filed Dec. 30, 1904. Serial No. 238,907.



Claim.—1. In a feeder, a plurality of feed-bars supported for reciprocation and oscillation, feed members upon the upper sides of said bars for feeding material in one direction over the ends of the bars, feed members upon the under sides of said bars for feeding material in the opposite direction, and means, including a curved member, forming a closure at the front end of the casing and constituting guiding and supporting means for the material operated upon.

2. In a feeder, a casing having a curved end piece, a shaft concentric with said end piece and having a plurality of cranks, feed-bars supported pivotally upon said cranks, links pivotally supporting the opposite ends of the feed-bars, feed members connected with the upper sides of the feed-bars for feeding material in the direction of the curved end piece, and means connected with the under sides of the feed-bar for feeding material in the opposite direction.

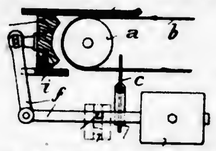
3. In a feeder, a casing open at one end and having a curved end piece at the opposite end, a shaft approximately concentric with said curved end piece and having a plurality of cranks, feed-bars connected pivotally with said cranks, supporting means for the opposite ends of said feed-bars, feed members upon the upper sides of the feed-bars for feeding material in the direction of the curved end piece, feed members upon the under sides of the feed-bars for feeding material in the opposite direction, and a gage-board supported adjustably with relation to the crank-supported ends of the feed-bars.

4. In a device of the class described, a casing, feed members movably supported in said casing for the reception and support of the material to be fed and for conveying said material in one direction over the ends of said feed members, a pair of longitudinally-slotted arms connected adjustably with and extending above the casing, and a gage-board supported pivotally between said arms and adjustable thereby with relation to the ends of the feed members over which the material is fed.

5. In a feeder, a casing, a plurality of feed members supported for reciprocation and oscillation and constituting supporting means for the material to be operated upon, means connected with said feed members for feeding material in one direction over the ends of said feed members, a gate or gage board supported by the casing and adjustable with relation to the ends of the feed members over which material is fed, and means connected with the under sides of the feed members for engaging the material fed over the ends of the latter and for moving said material over the bottom of the casing in the direction of the discharge end of the latter.

6. In a feeder, a casing open at one end and having a curved end piece at the opposite end, a shaft approximately concentric with said curved end piece and having a plurality of cranks, feed-bars connected pivotally with said cranks, hangers constituting supporting means for the opposite ends of said feed-bars, and curved hook members upon said feed-bars extending upwardly and downwardly in the direction of the curved end piece of the casing.

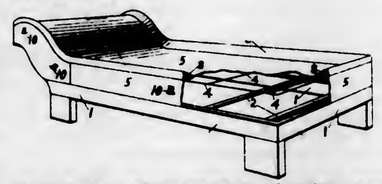
810,938. SAFETY DEVICE. WILHELM HANKE, Gowarsewo, near Schwersens, Germany. Filed Feb. 9, 1905. Serial No. 244,830.



Claim.—1. In a machine having a fast and a loose pulley, a driving-belt, and means for placing said belt in and out of gear, the combination of a brake adapted to bear against the fast pulley, a guide for guiding said brake, said guide having an extension situated in proximity to the belt and adapted to form a belt-protector, a lever, means connecting said lever with said brake, means exerting a force on said lever and tending to apply the brake to the fast pulley, means for normally holding said lever in its position corresponding to the off position of the brake, and means for locking said brake in its applied position, substantially as and for the purpose set forth.

2. In a machine having a fast and loose pulley, a driving-belt, a belt-fork for placing said belt in and out of gear, a slidable rod carrying said fork, a handle on said rod, the combination of a brake-block *e* adapted to bear against the fast pulley, a guide *i* for guiding said brake-block, said guide having an extension situated in proximity to the belt and adapted to form a belt-protector, an angle-lever *f* having a projecting tooth *f'*, means connecting said lever with the central portion of the back of said brake-block, a weight *g* on said angle-lever and tending to apply the brake-block to the fast pulley, a stop *k* mounted on the rod carrying the belt-fork and adapted to normally support the angle-lever and to hold it in its position corresponding to the off position of the block and to move out of engagement with said lever when the belt is thrown out of gear, and a toothed rack *h* with which the tooth on the lever *f* is adapted to engage when the brake-block is in its applied position, substantially as and for the purpose set forth.

810,939. COUCH. JOHN L. HEPPNER, Peoria, Ill. Filed Nov. 17, 1904. Serial No. 233,115.



Claim.—1. In a couch, the combination of a yielding support, a removable cushion thereon, and a raised edge on said yielding support adapted to hold the said cushion in place.

2. In a couch, the combination with a suitable base and springs thereon, of a flat surface formed on the springs, a raised portion around the edge of the said flat surface, and a mattress supported upon the said flat surface and conforming to the said raised edge.

3. The combination of a suitable frame, a loose mattress or cushion supported on the said frame, a raised edge around the supporting-surface of the said frame, a depression in the said mattress or cushion in which the said raised edge is socketed, and means for detachably securing the said mattress or cushion on the frame.

4. In a couch, the combination with a suitable base and springs

thereon, of a flat surface formed on the springs, a raised portion around the edge of the said flat surface, a mattress supported upon the said flat surface and conforming to the said raised edge, and fasteners for detachably securing the said mattress on the said frame.

5. The combination of a couch-frame, a raised padded portion around the edge of the upper surface of the said couch-frame, and a removable mattress supported thereon and conforming to the said raised padded portion.

6. The combination of a suitable frame, a loose mattress or cushion supported on the said frame, a raised edge around the supporting-surface of the said frame, and a depression in the mattress or cushion in which the said raised edge is socketed.

7. The combination of a couch-frame with raised padded portions on the top thereof, a removable mattress supported on the said couch-frame, depressions in the said removable mattress at the places where it contacts with the aforesaid raised padded portions of the couch-frame, and fasteners for securing the said mattress in position on the said couch-frame.

8. The combination of a couch-frame, a detachable mattress supported thereon, raised padded portions on the top of the couch-frame, corresponding depressions in the aforesaid mattress, into which the said raised portions of the couch-frame fit, and fasteners on the couch-frame and the mattress to secure the said mattress to the couch-frame.

9. The combination of a couch-frame, a detachable mattress supported thereon, a cut-out portion around the lower edge of the mattress, a triangular or V shaped padding fastened around the edge of the top of the couch-frame, straps on the said detachable mattress and buckles on the said couch-frame, substantially as and for the purposes specified.

10. The combination with a couch-base of springs supported thereon, a covering for the said springs, a raised padded portion on the top of the spring-covering, a cut-out portion on the mattress supported upon the said spring-covering, the said cut-out portion of the mattress to fit onto the said raised padded portion on the spring-covering, and means to fasten the said mattress to the covering of the springs.

11. The combination with a couch-base of springs supported thereon, a yielding frame fastened to the top of the springs, a flexible covering drawn and fastened over the said frame and inclosing the springs, a triangular or V shaped padding around the edge of the upper surface of the said covering, a mattress supported upon the said covering, the said mattress having a cut-out portion around the edge of the lower surface to fit the triangular or V shaped padding on the aforesaid covering, straps on the said mattress and buckles on the said covering and a drapery hanging over the said straps and buckles, substantially as specified.

12. The combination of a couch-frame, a raised padded edge around the upper surface of the said couch-frame, a loose mattress supported on the said upper surface, and conforming to the said raised padded edge and fasteners for securing the said mattress in position on the couch-frame.

13. In a couch, the combination with a suitable base of a spring-surface upon which a removable or detachable mattress or cushion is supported, a raised edge, about the said spring-surface, upon which the said removable mattress or cushion rests when in position, and to which that portion of the mattress or cushion in contact therewith conforms.

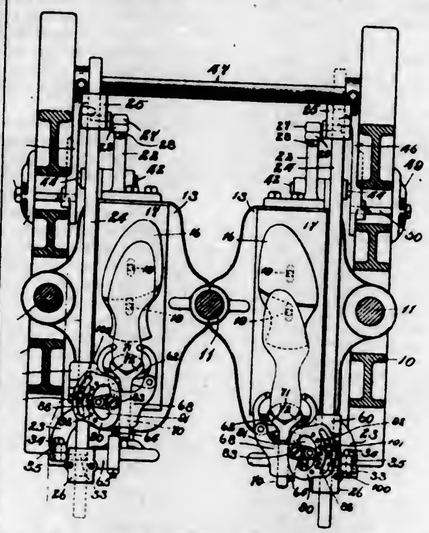
14. In a couch, the combination of a frame, a yieldingly-supported surface thereon elevated above said frame, a removable cushion on said yielding surface, a raised edge on said yielding surface adapted to hold the cushion in place thereon, and a band fastened to and depending from the said raised edge and adapted to cover the space between the yielding surface and the supporting-frame.

810,940. SOLE-MOLDING MACHINE. JOHN J. HEYD, Lynn, Mass., assignor of one-half to Maurice V. Brennahan, Lynn, Mass. Filed Nov. 26, 1903. Serial No. 182,943.

Claim.—1. In a sole-molding machine, complemental molds and mechanism movable bodily with relation to the molds and supported independently of said molds for automatically grasping a sole, feeding it to a position between the molds, holding it between the molds during the molding operation, and withdrawing it therefrom after it is molded.

2. In a sole-molding machine, molding mechanism, devices for grasping a sole, and automatic mechanism for actuating said devices relatively to said molding mechanism in consequence of which they feed a sole to the molding mechanism, hold it during the molding operation, and withdraw it from the molding mechanism.

3. In a sole-molding machine, molding mechanism, a reciprocatory sole-grasping device, means for reciprocating said device to cause it to place a sole in the molding mechanism and to withdraw it therefrom, and means for causing said device to grasp and release the sole.



4. In a sole-molding machine, molding mechanism including molds movable toward and from each other, a sole-engaging device, means for causing said device to grasp and hold a sole, and means for moving said device transversely with relation to both of said molds, to feed the sole between the molds and there hold it without said device lying between the molds.

5. In a sole-molding machine, molding mechanism including complemental molds movable toward and from each other, a sole-engaging device, means for causing said device to grasp the heel end of a sole, and automatic mechanism for moving said device relatively to said molds to feed the sole between the molds to hold it there during the molding operation and to withdraw it therefrom after it is molded.

6. In a sole-molding machine, molding mechanism, a reciprocatory carrier movable toward and from the molding mechanism, a guide therefor, coacting fingers mounted on said carrier and adapted to engage the edges of a sole, means for opening and closing said fingers when said carrier is remote from the molding mechanism, and means for actuating said carrier.

7. In a sole-molding machine, molding mechanism, fingers adapted to engage the side edges of a sole at the heel end thereof, a carrier movable in lines substantially parallel to the longitudinal lines of the molds, and means for actuating said carrier and said fingers whereby said fingers carry a sole between the molds and hold it until the molds compress the sole.

8. In a sole-molding machine, molding mechanism having coacting molds movable toward and from each other, coacting fingers adapted to grasp a sole between them, means for moving said fingers relatively to said molds in lines longitudinal of the sole grasped thereby to feed the sole longitudinally between the molds, and means for causing said fingers to release said sole only when said fingers are remote from said molds.

9. In a machine for molding soles, molding mechanism comprising molds which lack a portion of the heel end whereby the heel of a sole placed between them will project beyond the heel ends of the molds, and automatic means independent of the molds and movable toward and from them for grasping the heel end of a sole and inserting it between the molds, whereby said means may continue to grasp the sole while it is initially engaged by the said molds, and thus prevent the dislocation of the sole.

10. In a sole-molding machine, molding mechanism including complemental molds movable toward and from each other, fingers adapted to engage the side edges of a sole at or near its heel, and mechanism for actuating said fingers to place a sole between the molds.

11. In a sole-molding machine, molding mechanism including complemental molds movable toward and from each other, a carrier, means for moving said carrier relatively to said molds in lines transverse to the lines of movement thereof, and sole-grasping means mounted on said carrier, and adapted to hold the sole against dislocation without said means lying between said molds.

12. In a sole-molding machine, molding mechanism including complemental molds movable toward and from each other, a pair of coacting fingers adapted to engage a sole between them, mechanism for moving said fingers to place a sole engaged thereby between the molds, and mechanism for automatically opening and closing said fingers, said last-mentioned mechanism causing said fingers to remain closed on the sole during the molding operation.

13. In a sole-molding machine, a pair of molds of which one is movable, a movable support for the movable mold, and automatic sole-feeding mechanism mounted on said movable support and comprising a sole-grasping device, and means for bodily moving said device relatively to the movable mold in lines transverse to the lines of movement of the mold-support whereby said device places a sole between the molds and then withdraws it therefrom, without said device lying between said molds.

14. In a sole-molding machine, a pair of molds, a movable support for one of said molds, adapted to move from a position of clearance to a position of pressure and vice versa, a sole-grasping device movable transversely of the path of movement of said support, and automatic mechanism for moving said device from a sole-receiving position to a position in which the sole carried thereby is located between the molds, without said device entering the space between the molds, said mechanism being timed whereby the sole is placed between the molds, when said support is in a position of clearance.

15. In a sole-molding machine, molding mechanism, coacting fingers for grasping a sole, a carrier for said fingers movable relatively to the molding mechanism, means for causing said fingers to close, means for actuating said carrier to cause the fingers to feed and hold the sole between the molds, and means for opening the fingers after they have withdrawn the sole from the molds.

16. In a sole-molding machine, a sole-feeding mechanism comprising a device for supporting the heel end of the sole, means for engaging the side edges of said sole, and provisions for moving said device and said means in a direction longitudinally of the sole.

17. In a sole-molding machine, coacting molds, means for feeding a sole between said molds comprising fingers for gripping the sole between them, and means for moving said fingers relatively to the said molds to feed the sole between them, and a gage adjustable with relation to said fingers to determine the points where the sole is gripped by the fingers.

18. In a sole-molding machine, molding mechanism, sole-feeding mechanism comprising a reciprocatory carrier adapted to move toward and from the molds, a pair of connected fingers mounted on said carrier, a spring for closing said fingers, and means for opening said fingers only when the fingers are remote from said molds.

19. A sole-feeding attachment for a molding-machine comprising supports, a reciprocatory carrier thereon, mechanism for reciprocating the carrier, a gage on said carrier, coacting fingers adapted to grasp the heel end of a sole and to coact with the gage in feeding the sole from a point remote from both molds to a position between the molds, and means for causing the opening of said fingers only when they are remote from the molds.

20. A sole-feeding attachment for a molding-machine comprising movable supports, a carrier adapted to reciprocate thereon and having rack-teeth, a toothed segment meshing with said rack-teeth and having an arm, a path-cam attached to the frame of the machine and engaged by said arm, and a sole-engaging device on said carrier.

21. The combination, with a molding-machine having complemental molds, of a sole-feeding mechanism comprising devices for engaging and feeding a sole a predetermined distance relatively to both of said molds and a gage movable with relation to said devices in lines longitudinal of the lines of movement of the said devices, to position the sole relatively to said devices.

22. The combination, with a molding-machine having complemental molds, of a sole-feeding mechanism comprising a carrier movable relatively to both of the molds, means for so moving said carrier, means on said carrier for engaging and feeding a sole between the molds, and an adjustable gage on said carrier movable relatively to said engaging means for determining the extent of movement of the sole between the molds.

23. The combination, with a molding-machine having complemental molds, of a sole-feeding mechanism comprising a reciprocatory carrier movable with relation to said molds and having coacting fingers for engaging the sole and feeding it between the molds, and a gage on said carrier for engaging the heel end of the sole and determining the extent of movement of the sole.

24. A sole-feeding mechanism for molding-machines comprising coacting fingers for engaging the side edges of the sole, a carrier for said fingers movable longitudinally of the sole, a gage on said carrier for engaging the heel end of the sole, and means whereby said gage may be adjusted longitudinally of the lines of movement of the carrier.

25. An attachment for molding-machines comprising devices for engaging and feeding a sole between the molds, means for moving said devices relatively to the molds, and a gage movable relatively to said molds and with said devices, said gage having a portion to project under the heel end of the sole, and two angularly disposed faces to engage the sole at the heel end.

26. The combination, with a molding-machine having complemental molds, of a sole-feeding mechanism comprising devices for engaging a sole and feeding it relatively to the molds, and a gage having a portion to project under the heel end of the sole, and a portion to engage the edge of the sole at the heel end, means for moving said devices and said gage longitudinally of the sole to feed the same between the molds, and means whereby said gage may be adjusted relatively to said devices.

27. The combination with a molding-machine having complemental molds, of a sole-feeding mechanism comprising sole-engaging devices, means for moving said devices relatively to the molds to feed a sole between the molds, an adjustable gage for positioning the sole relatively to said sole-engaging devices, and an indicator for showing the position of the gage.

28. The combination, with a molding-machine having complemental molds, of a sole-feeding mechanism comprising sole engaging and feeding devices for engaging a sole and feeding it relatively to the molds, an adjustable gage for the sole for positioning the sole relatively to said device, an index connected to the gage, and a scale in operative relation to the index.

29. A sole-feeding mechanism for molding-machines comprising sole-engaging devices, an adjustable gage for the sole, an index connected to the gage, and a scale in operative relation to the index, said scale having gradations with a plurality of symbols indicating the several sizes of shoes of different character.

30. In a molding-machine, the combination with complemental molds of sole-feeding devices movable bodily relatively to the molds to feed a sole therebetween, a movable gage movable with the sole-feeding devices, a handle for adjusting said gage with relation to said devices, and means on the handle for securing said handle and thereby said gage in any one of a plurality of positions.

31. A sole-feeding mechanism for molding-machines comprising a movable gage, an index connected to said gage, an adjustable scale having graduated provisions for the attachment of the index, and means for securing the scale-plate after adjustment.

32. A molding-machine comprising molds and mold-supports, sole-feeding devices movable relatively to the molds, a gage, and means for moving said devices and said gage, said gage being adjustable relatively to the said devices in accordance with the size of the sole to be molded, to position the sole relatively to said devices.

33. A sole-molding machine comprising molding mechanism, sole-feeding devices, a gage, means for adjusting said gage relatively to said devices for soles of different kinds, provisions for adjusting said gage relatively to said first-mentioned means for different sizes of soles of the same kind, and means for actuating said devices and said gage relatively to said molding mechanism.

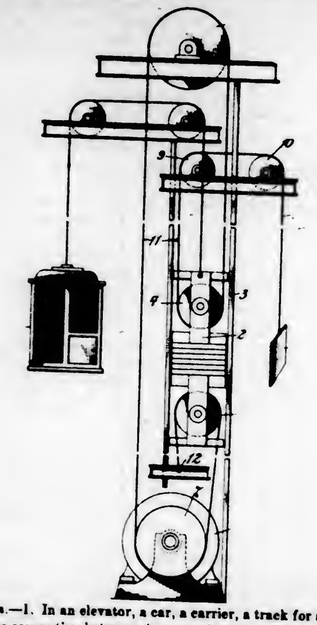
34. A sole-molding machine comprising molding mechanism, automatic sole-feeding devices independent of and movable relatively to said molding mechanism, and having a uniform range of movement, and a sole-gage movable with said devices but adjustable relatively thereto.

35. A sole-molding machine comprising complemental molds, and automatic sole-feeding mechanism movable with relation to the molds and having provisions whereby soles of different lengths may be laid by said sole-feeding mechanism between the said molds with the ball-line of each sole registering with the ball-line of the molds.

36. A series of pairs of complemental molds of different lengths, one mold of each pair having a device by which it may be secured to its support, the devices on all of the said molds so provided being at the same distance from the heel ends.

37. A series of pairs of complemental molds, of different lengths, one mold of each pair having a pin-receiving aperture, and the said apertures in all the molds being at the same distance from the heel ends.

810,941. TRACTION APPARATUS. ELISHA HUNT and HENRY G. DE BUKEMS, New York, N. Y., assignors, by direct and mesne assignments, to Elevator Securities Company, a Corporation of New Jersey. Filed May 7, 1903. Serial No. 156,945.



Claim.—1. In an elevator, a car, a carrier, a track for said carrier a cable connection between the car and carrier and two movable pulleys on said carrier; in combination with a fixed pulley near each extremity of the carrier-track, a reversible motor arranged to impel one of said pulleys, and a driving-cable anchored at one end and carrying a weight at the other end, said cable passing from its anchorage around one movable pulley, thence in the same direction around one of the fixed pulleys, thence in the same direction around the second fixed pulley and thence in the same direction around the second movable pulley to the weight, substantially as described.

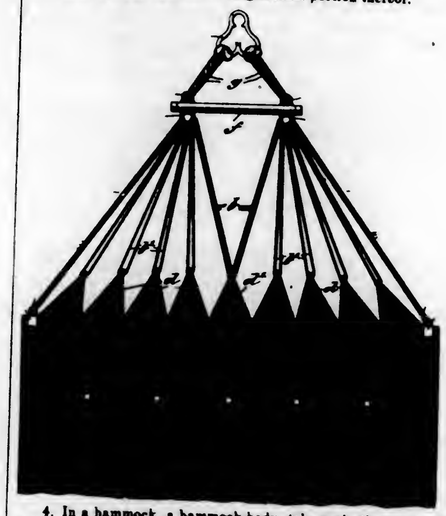
2. In an elevator, a car, a carrier, a track for said carrier a cable connection between the car and carrier and movable pulleys with parallel axes on the top and bottom of said carrier respectively in combination with a fixed pulley having its axis parallel to those of said movable pulleys directly beneath the lowest point of travel of said carrier, a reversible motor for driving the same, two fixed pulleys directly above the highest point of travel of said carrier, one of which has its axis parallel to those of said movable pulleys and a driving-cable anchored below said carrier-track at one end and bearing a weight at its other end, said cable passing from its anchorage around one movable pulley, thence in the same direction around one of the fixed pulleys, thence in the same direction around the second fixed pulley, thence in the same direction around the second movable pulley and thence around the third fixed pulley to the weight, substantially as described.

810,942. HAMMOCK. HERMAN L. HOELFELD, Philadelphia, Pa. Filed Sept. 26, 1905. Serial No. 280,063.

Claim.—1. In a hammock, a hammock-body, two groups or sections of strings, the inner contiguous strings of each section merging into each other and adapted to support said hammock-body at its central portion and arranged to permit of a yielding of the same at this portion to equally distribute the weight carried by the hammock-body over both sections of said strings.

2. In a hammock, a hammock-body having hammock-cloth, two groups or sections of strings, the inner contiguous strings of each section merging into each other by engaging the central portion of said hammock-cloth, said inner strings arranged to equally distribute the weight carried by said hammock-body over both sections of said strings.

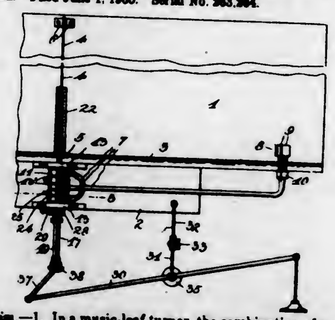
3. In a hammock, a hammock-body having tabs, loops secured to said hammock-body, two groups or sections of strings, each consisting of a series of strings, the outer one of said series of strings being adapted to engage said loops and the inner contiguous strings of said section adapted to engage a tab centrally arranged with respect to said hammock-body, and the intermediate string of the strings of each section thereof arranged to assist in the support of said hammock-body beyond the central longitudinal portion thereof.



4. In a hammock, a hammock-body, tabs projecting an equal distance apart from said body, two groups or sections of strings adapted to engage said tabs, the inner contiguous strings of each section of said strings being arranged to engage one of said tabs centrally arranged with respect to said hammock-body.

5. In a hammock, a hammock-body, tabs projecting an equal distance apart from said body, loops secured to said body having eyes, two groups or sections of strings adapted to engage said tabs and eyes, the inner and outer reinforced strings of each of said groups being adapted to support each end of said hammock-body by engaging said eyes, and the inner contiguous strings being adapted to support said hammock-body at its central portion by engaging one of said tabs.

810,943. MUSIC-LEAF TURNER. FRANK J. HOLOUBEK, Oakland, Iowa. Filed June 1, 1905. Serial No. 263,264.



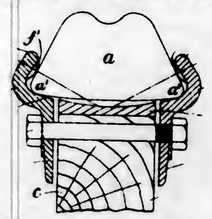
Claim.—1. In a music-leaf turner, the combination of a series of pivoted leaf-turning arms, each having a spring to turn it in one direction, a spring-actuated sliding rod to lock the said arms in initial position and successively release them, and pivotally-mounted controllers forming stops to prevent movement of the rod, said controllers and arms having coacting means to cause each arm during its pivotal movement by its spring, to impart such motion to one of the controllers as will cause the latter to clear the rod and permit the said rod to be moved to another controller.

2. In a music-leaf turner, the combination of a series of pivoted leaf-turning arms, each having a spring to turn it in one direction and a tappet-pin, a spring-actuated sliding rod to lock said arms in initial position and successively release them, and pivotally-mounted controllers forming stops to prevent movement of the rod and having curved slots in which the tappet-pins of the arms operate, for the purpose set forth.

3. In a music-leaf turner, the combination with a series of leaf-turning arms having hubs or rings formed with openings or notches, springs inclosed in said hubs or rings and adapted to swing said arms in one direction, a sliding rod adapted to enter the openings in said hubs or rings to hold the latter against the action of said springs, controlling-disks to permit step-by-step sliding movement of the rod located intermediate said hubs or rings and formed with curved grooves or slots, pins upon said arms to coact with said grooves or slots, springs upon said disks to retard their movement and means for operating said sliding rod.

4. In a music-leaf turner, the combination of a series of pivoted leaf-turning arms, each having a spring to turn it in one direction, a spring-actuated sliding rod to lock the said arms in initial position and successively release them, and movable controllers forming stops to prevent movement of the rod, said controllers and arms having coacting devices to cause each arm during its pivotal movement by its spring, to impart such motion to one of the controllers as will cause the latter to clear the rod and permit the said rod to be moved to another controller.

810,944. ELASTIC TIRE. JOHN E. HOPKINSON, West Drayton, England. Filed Aug. 15, 1905. Serial No. 274,348.



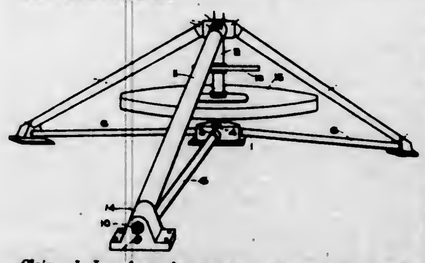
Claim.—1. In a tire, the combination with a concave rim and a rubber tire extending across said rim, of cheek-plates adapted to compress the rubber laterally, of reëntering flanges upon the cheek-plates and of serrations upon the inner faces of the flanges arranged to thrust the tire into the concave rim.

2. In a tire, the combination with a concaved rim and a rubber tire having a flatter base than the rim, of cheek-plates having reëntering flanges and of serrations upon the interior faces of the flanges which bite into the sides of the rubber tire.

3. In a tire, the combination with a felly, a concaved ring mounted on the felly, and a rubber tire having a base of less curvature than the rim, of cheek-plates secured upon the sides of the felly, undercut recesses upon the inner sides of said cheek-plates, reëntering flanges at the peripheries of said cheek-plates and serrations upon the inner sides of the flanges, adapted to press into the rubber tire.

4. In a tire of the class described, cheek-plates having reëntering flanges fitted with serrations adapted to force the tire into its rim.

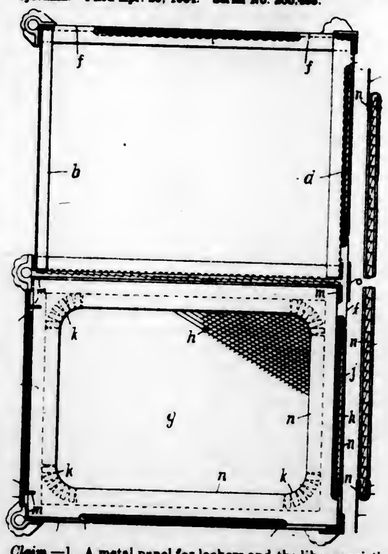
810,945. FRAME FOR PUMPING POWERS. WILLIAM HURD, Warren, Ind., and WILLIAM WRIGHT, Franklin, Pa. Filed Oct. 15, 1904. Serial No. 228,063.



Claim.—1. In a frame for pumping powers, a lower bearing, adapted to the reception of the lower end of a vertical shaft, an upper bearing, adapted to the reception of the upper end of a vertical shaft, there being radially-disposed bosses on each of said bearings, arranged in vertically-alined pairs, a tubular brace for each of said bosses, and receiving the same at one end, an anchor-block adapted to the attachment of the other end of each vertically-alined pair of braces, a tie-rod passing through each of said braces and secured at one end in one of the bosses aforesaid and at the other end in its respective anchor-block.

2. In a frame for pumping powers, an upper bearing and a lower bearing, and the anchor-blocks, in combination with the tie-rods and tubular braces, arranged in vertically-alined pairs and connecting said bearings and said anchor-blocks.

810,946. PANEL FOR METAL LOCKERS. RICHARD W. JEFFERIS, Camden, N. J., assignor to Merritt & Company, a Corporation of Pennsylvania. Filed Apr. 20, 1904. Serial No. 204,483.



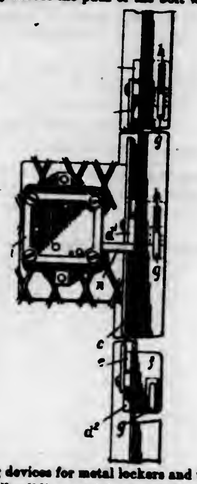
Claim.—1. A metal panel for lockers and the like, consisting of an outer metal frame composed of angle-irons and a wall carried by said frame and formed partly of closed sheet metal and partly of reticulated metal, the closed portion of said wall consisting of a continuous sheet of metal secured at its outer edges to the angle-irons and having an opening bounded by a continuous portion of sheet metal of substantial width, the edges of the sheet metal about said opening being bent back upon the body of the sheet, and the reticulated portion consisting of a sheet of reticulated metal arranged over said opening with its edges resting on the backwardly-bent edges of the closed sheet metal, said bent edges being again bent forward over the edges of the reticulated metal and inclosing them.

2. A metal panel for lockers and the like, consisting of an outer metal frame composed of angle-irons and a wall carried by said frame and formed partly of closed sheet metal and partly of reticulated metal, the closed portion of said wall consisting of a continuous sheet of metal secured at its outer edges to the angle-irons and having an opening bounded by a continuous portion of sheet metal of substantial width, the edges of the sheet metal about said opening being bent back upon the body of the sheet, and the reticulated portion consisting of a sheet of reticulated metal arranged over said opening with its edges resting on the backwardly-bent edges of the closed sheet metal, said bent edges being again bent forward over the edges of the reticulated metal and inclosing them and the extremities of said bent edges being bent in as at *j* to form a rounded edge.

810,947. LOCKING DEVICE FOR METAL LOCKERS. RICHARD W. JEFFERIS, Camden, N. J., assignor to Merritt & Company, a Corporation of Pennsylvania. Filed Apr. 20, 1904. Serial No. 204,484.

Claim.—1. In locking devices for metal lockers and the like, the combination of a vertically-sliding catch-bar carried by the door-frame and provided with a projection n extending laterally in a plane

transverse to the catch-bar, a lock carried by the door-frame and having its bolt arranged to be projected forward across the path of the lateral projection of the catch-bar, said projection being movable transversely across the path of the bolt when it is retracted.



2. In locking devices for metal lockers and the like, the combination of a vertically-sliding catch-bar carried by the door-frame and provided with a projection extending laterally in a plane transverse to the catch-bar, a lock carried by the door-frame and having its bolt arranged to be projected forward across the path of the lateral projection of the catch-bar, said projection being movable transversely across the path of the bolt when it is retracted, and auxiliary fastenings located at the top and bottom of the door-frame and controlled by said sliding catch-bar.

3. In locking devices for metal lockers and the like, the combination of a vertically-sliding catch-bar carried by the door-frame and located at the back, an actuating-plate connected with said sliding catch-bar and provided with an eye *j*, and an eye *k* carried by the door-frame and projecting through a slot in the actuating-plate adjacent to the eye *j* thereof said eye *j* being movable vertically past the eye *k* and occupying a position immediately adjacent to it when the sliding catch-bar is in locking position.

4. In locking devices for metal lockers and the like, the combination of a sliding catch-bar carried by the door-frame and located at the back, an actuating-plate connected with said sliding catch-bar and provided with an eye *j*, an eye *k* carried by the door-frame and projecting through a slot in the actuating-plate adjacent to the eye *j* thereof, a key-actuated lock carried by said door-frame, and a projection carried by the sliding catch-bar and movable across the face of the bolt of said lock when the same is retracted but adapted to be arrested thereby when the bolt is projected.

810,948. GARMENT-CLASP. OTTO KERSTEN, Bloomsburg, Pa., assignor of one-fourth to J. T. Treay, one-fourth to H. W. Dietterich, and one-fourth to Frank Ikeler, all of Bloomsburg, Pa. Filed July 24, 1905. Serial No. 271,069.

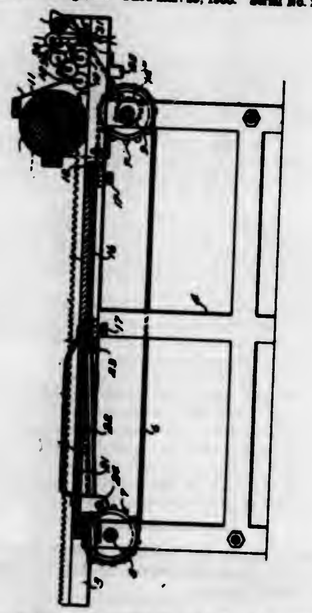
Claim.—A garment-clasp comprising a body having opposite resilient cheek-pieces, one of which is provided therein with a lever-opening, and the other of which piece is provided in its inner side with a depression constituting a keeper-socket and having a flat binding-shoulder near one end of the cheek-piece, and a straight inclined wall sloping to the base of the shoulder, and a swinging lock-lever pivoted on the cheek-piece opposite the socket and having an inner engaging arm whose point swings over the inclined wall of the socket in opposition to the flat shoulder, said lever also having an outer operating-arm provided with a fastening-tongue having a snapping engagement with an edge of the lever-opening.

810,949. TRANSPOSER FOR MUSICAL INSTRUMENTS. THEODORE W. KIESAU, New York, N. Y., assignor of one-half to George Lucas, Brooklyn, N. Y. Filed Mar. 22, 1905. Serial No. 251,423.

Claim.—1. A cable embracing two sets of electrical conductors with an equal number in each set and means for connecting one end of all of the conductors of one set to one end of all of the conductors of the other set in all of their adjusted positions, said means holding all of said ends of each set in the same relative positions, but permitting one set of ends to shift their connections as an entirety with the other set of ends to any desired extent.

2. A cable embracing two sets of electrical conductors and two common return-conductors therefor, there being an equal number of conductors in each set circularly arranged around the two common return-conductors; in combination with means for detachably connecting and disconnecting one end of all of the circularly-arranged conductors to and from the corresponding ends of the other circularly-arranged conductors, and similar means for detachably connecting and disconnecting the two return-conductors, the two sets of conductors being at equal radial distances from their corresponding return-conductors and at equal distances apart, whereby variable rotatable circuit connections may be effected between said sets of conductors to any desired extent.

810,950. PRESS FOR PRINTING UPON METAL. GEORGE KREHLING, Chicago, Ill. Filed Mar. 20, 1905. Serial No. 250,694.



Claim.—1. In a device of the class described, the combination of a bed, means for securing a printing-plate upon said bed, a carriage mounted above said bed and movable along the same, a cylinder journaled in said carriage and adapted to roll along the upper surface of said plate when said carriage is moved along the same, inking mechanism for applying ink to said plate, a platen-plate adapted to hold a sheet of material with its upper surface in substantially the same plane with the upper surface of said printing-plate, said cylinder being adapted for receiving an impression from said printing-plate and transferring said impression to said sheet when said cylinder moves along the bed, and mechanism for shifting said platen-plate so as to carry said sheet out of the path of said cylinder during its return movement.

2. In a device of the class described, the combination of a frame, a bed on said frame for supporting sheet of metal, a carriage movable forward and back along said frame above said bed, a transfer-cylinder having a layer of soft resilient material on its periphery and

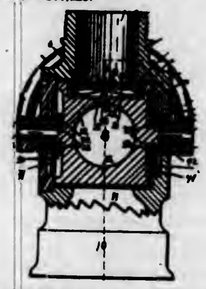
journaled in said carriage in position to have rolling contact with said sheet when said carriage is moved along said bed, inclined guides supporting said bed, and said carriage being adapted to engage said bed and shift the same along said guides to lower said sheet out of the return-path of said cylinder after said cylinder has passed across said sheet.

3. In a device of the class described, the combination of a frame, a bed on said frame for supporting a sheet of metal, a carriage movable forward and back along said frame above said bed, a transfer-cylinder having a layer of soft resilient material on its periphery and journaled in said carriage in position to have rolling contact with said sheet when said carriage is moved along said bed, inclined guides supporting said bed, said carriage being adapted to engage said bed and shift the same along said guides to lower said sheet out of the return-path of said cylinder after said cylinder has passed across said sheet, and a stop for limiting the position of said bed toward the upper end of said guide.

4. In a device of the class described, the combination of a frame, a bed on said frame for supporting a sheet of metal, a carriage movable forward and back along said frame above said bed, a transfer-cylinder having a layer of soft resilient material on its periphery and journaled in said carriage in position to have rolling contact with said sheet when said carriage is moved along said bed, inclined guides supporting said bed, said carriage being adapted to engage said bed and shift the same along said guides to lower said sheet out of the return-path of said cylinder after said cylinder has passed across said sheet, and an adjustable stop for limiting the movement of said bed toward the upper end of said guides and thereby controlling the adjustment of said sheet toward said transfer-cylinder.

5. In a device of the class described, the combination of a frame, a printing-plate supported in a horizontal position in said frame, a bed adapted to support a sheet of metal in the same plane with said printing-plate, a carriage movable forward and back along said frame above said bed, a transfer-cylinder journaled in said carriage and adapted to have rolling contact with said plate and sheet when said carriage is moved along in one direction and mechanism for shifting said bed so as to move the same out of the path of said cylinder prior to the return movement of said cylinder.

810,951. VALVE. MAURICE D. LARKIN, Dayton, Ohio. Filed Oct. 15, 1903. Serial No. 177,139.



Claim.—1. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body, so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being formed of a plurality of integral layers with an intervening cavity, and means mounted upon the outer of said layers and adapted to press the inner of said layers against a portion of said member surrounding its operating projection, substantially as specified.

2. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being formed of a plurality of integral layers with an intervening cavity, and means mounted upon the outer of said layers and adapted to press the inner of said layers against a portion of said member surrounding said operating projection, substantially as specified.

3. In a valve the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being formed of a plurality of integral layers with an intervening cavity, and a screw threaded into the outer of said layers and adapted to press the inner of said layers against a portion of said member surrounding said operating projection, substantially as specified.

4. In a valve the combination of a valve-body, having an opening therethrough, a valve member removably mounted in said valve-body so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being removably secured to said valve-body and formed of a plurality of integral layers with an intervening cavity, and means mounted upon the outer of said layers and adapted to press the inner of said layers against a portion of said member surrounding its operating projection, substantially as specified.

5. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being removably secured to said valve-body and formed of a plurality of integral layers with an intervening cavity, and a screw threaded into the outer of said layers and adapted to press the inner of said layers against a portion of said member surrounding said operating projection, substantially as specified.

6. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, an operating projection on said member passing through a wall of said valve-body, said wall of said valve-body being removably secured to said valve-body and formed of a plurality of integral layers with an intervening cavity, and a hollow screw surrounding said operating projection and threaded through the outer of said layers for pressing the inner of said layers against a portion of said member surrounding said operating projection, substantially as specified.

7. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body, so that said opening may be opened or closed thereby, an operating projection on each of the opposite ends of said member and passing through opposite walls of said valve-body, said walls of said valve-body each being formed of a plurality of integral layers with an intervening cavity, and means mounted upon the outer of said layers of each of said walls and adapted to press portions of said member surrounding said operating projection between said inner layers, substantially as specified.

8. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body, so that said opening may be opened or closed thereby, an operating projection on each of the opposite ends of said member and passing through opposite walls of said valve-body, said walls of said valve-body being each formed of a plurality of integral layers with an intervening cavity, and a screw threaded into the outer of said layers of each of said opposite walls and adapted to press the inner of said layers of each of said walls against a portion of said member surrounding each of said operating projections, substantially as specified.

9. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, a plurality of operating projections on said member passing through a corresponding plurality of walls of said valve-body, each of said walls of said valve-body being formed of a plurality of integral layers with an intervening cavity, and a hollow screw surrounding each of said operating projections and threaded through the outer layer of each of said walls for pressing the inner of said layers against portions of said member surrounding said operating projections, substantially as specified.

10. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, a plurality of operating projections on said member and passing through a corresponding plurality of walls of said valve-body, one of said walls of said valve-body being removably secured to said valve-body and each of said walls being formed of a plurality of integral layers with an intervening cavity, and means mounted upon the outer layer of each of said walls and adapted to press the inner layer of each of said walls against portions of said member surrounding said operating projections, substantially as specified.

11. In a valve, the combination of a valve-body, having an open-

ing therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, a plurality of operating projections on said member passing through a corresponding plurality of walls of said valve-body, one of said walls of said valve-body being removably secured to said valve-body and each of said plurality of walls being formed of a plurality of integral layers with an intervening cavity, and a screw threaded into the outer layer of each of said walls and adapted to press the inner layer of each of said walls against portions of said member surrounding said operating projections, substantially as specified.

12. In a valve, the combination of a valve-body, having an opening therethrough, a valve member movably mounted in said valve-body so that said opening may be opened or closed thereby, a plurality of operating projections on said member passing through a corresponding plurality of walls of said valve-body, one of said walls of said valve-body being removably secured to said valve-body and each of said plurality of walls being formed of a plurality of integral layers with an intervening cavity, and a hollow screw surrounding each of said operating projections and threaded through the outer layer of each of said walls for pressing the inner layer of each of said walls against portions of said member surrounding each of said operating projections, substantially as specified.

13. In a valve, the combination of a valve-body having inlet and outlet openings and a cavity intermediate said openings; a valve member revolubly mounted in said cavity and having a stem; a cylindrical recess in one side of said valve member; a cylindrical member 17 slidably mounted on a guide in said recess of said valve member; a spring exerting outward pressure upon said member 17; and means independent of said stem and passing through said member 17 and being accessible through either of said openings for varying the tension of said spring; and an opening 13 through said valve member at angle to the said axis of said valve member, substantially as specified.

14. In a valve, the combination with a valve-body, having openings therethrough communicating with a cavity, a member 12 in said cavity and having trunnions 14 provided with bearings in the walls of said valve-body, an opening 13 through said member 12, a cylindrical cavity 16 in one side of member 12 and remote from the opposite ends of said member 12, a cylindrical member 17 slidably mounted upon guides 20 in said cavity 16, a relatively narrow rib 18 upon the outer surface and near the periphery of member 17, said rib 18 being adapted to engage a portion of the inner wall of said cavity in said valve-body and to close the outlet of one of the openings through said valve-body at times, said cavity 16 and member 17 with its rib 18 being slightly larger in diameter than said first-mentioned openings, and manually-adjustable means passing through said member 17 and accessible through either one of the openings through said valve-body, whereby said member 17 is pressed outwardly, substantially as specified.

15. In a valve, the combination of a valve-body having ways therethrough upon opposite sides of a cavity therein; a member 12 movably mounted across said way and filling said cavity and having a recess in one side thereof; a guide in said recess; a member 17 movably mounted in said recess and slidable upon said guide; said recess and member 17 being relatively smaller than the length of said valve-body, and said member 17 being adapted to close one of said ways through said valve-body; and means exposed upon the outer surface of said member 17 and accessible through the way closed by said member 17, whereby the relative positions of said members 12 and 17 may be adjusted to compensate for variations in manufacture and for wear, substantially as specified.

16. In a valve, the combination of a valve-body having ways therethrough upon opposite sides of a cavity therein; a member 12 movably mounted across said way and filling said cavity and having a recess in one side thereof; a guide in said recess; a member 17 movably mounted in said recess and slidably mounted upon said guide; said recess and member 17 being relatively smaller than the length of said valve-body, and said member 17 being adapted to close one of said ways through said valve-body; and a screw threaded through said member 17 and having its head end exposed upon but below the outer surface of said member 17, said head end of said screw being accessible through the way closed by said member 17, whereby the relative positions of said members 12 and 17 may be adjusted by said screw to compensate for variations in manufacture and for wear, substantially as specified.

17. In a valve, the combination of a valve-body having ways therethrough upon opposite sides of a cavity therein; a member 12 movably mounted across said ways and filling said cavity and having a circular recess in one side thereof; a guide in said recess; a circular member 17 movably mounted in said recess and slidable upon said guide; a spring member 22 confined in said recess by said member 17; said recess and member 17 being relatively smaller in diameter than the length of said valve-body, and said member 17 being adapted to close one of said ways through said valve-body; and a screw threaded through said member 17 and bearing at its inner end upon said spring member 22 and having its head end exposed upon but below the outer surface of said member 17, said head end of said screw being accessible through the way closed by said member 17, whereby the relative positions of said members 12 and 17 may be adjusted manually by said screw to compensate for variations in manufacture and automatically by said spring member 22 to compensate for wear; substantially as specified.

810,952. PIN HOLDING AND DELIVERY DEVICE. DE LOS A. LAWTON and LOUIS L. WITHEY, Rome, N. Y. Filed June 16, 1905. Serial No. 265,627.

Claim.—1. In a pin holding and delivering device, the combination of a toothed wheel, a plunger, means for transmitting motion from the plunger to the toothed wheel, and a pin-strip actuated step by step by said toothed wheel.

2. In a pin holding and delivering device, the combination with a pin-supporting strip in which the pins are arranged at regular intervals, a ratchet-wheel rotatable and provided with teeth successively engaging said pins to feed the strip one pin-space at a time, a finger-operated plunger and means for transmitting motion from said plunger to the ratchet-wheel.

3. A pin-strip feeding device comprising a rotary toothed wheel and a reciprocatory plunger adapted to be operated by the pressure of the finger and operatively connected to rotate said wheel.

4. In a device of the class described, a vertically-movable plunger adapted to be operated by the finger, in combination with a ratchet-wheel encircling the plunger and means for transmitting motion from the plunger to the ratchet-wheel.

5. In a device of the class described, the combination of a vertically-movable finger-actuated plunger, a toothed wheel having its axis coincident with the center of the plunger, a bell-crank actuated by the plunger and a pawl mounted on the bell-crank and engaging said wheel to rotate the latter one tooth at each operation of the plunger.

6. In a device of the class described, an inclosing case having a finger-opening and a pin-supporting strip movable across said opening to bring the heads of the pins in registration therewith, a toothed wheel rotatable step by step and operatively connected to feed said strip one pin-space at a time, and finger-operated means operatively connected to rotate said wheel one tooth-space at a time.

7. In a device of the class described, a finger-operated plunger having a finger-groove open at one side, a pin-strip and means brought into action by the depression of said plunger whereby the strip is fed one pin-space and one pin is brought into registration with the open side of the finger-groove as the plunger is depressed.

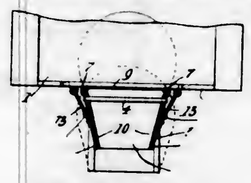
8. In a device of the class described, a pin-holding strip and feeding means therefor comprising a toothed wheel a plunger adapted to be operated by the finger and means brought into action by the depression of said plunger for rotating said wheel one tooth-space.

9. In a device of the class described, the combination of an inclosing case consisting of a base and a top portion telescoping with the base, a tubular post rising from the base, a plunger movable in said post, a rotary toothed wheel encircling said post, means for transmitting motion from the plunger to the wheel, and a pin-supporting strip actuated step by step at each movement of said wheel.

10. In a device of the class described, an inclosing case and pin-supporting strip having its pins spaced equidistant apart, said case having a finger-opening, a rotary wheel engaging and feeding the strip, a plunger movable through said wheel, and means for transmitting motion from the plunger to the wheel, whereby said wheel is caused to move the strip one pin-space to bring a pin into registration with the opening at each depression of the plunger.

810,953. DUMPING COAL-WAGON. WILLIAM LEONHARDT, Baltimore, Md., assignor to Leonhardt Wagon Manufacturing Company, Baltimore, Md., a Firm. Filed June 24, 1905. Serial No. 266,761.

Claim.—In combination with the body of a wagon having a delivery-opening, a spout which consists of a flanged plate situated under the body of the wagon and susceptible of an endwise movement, and of lateral deflection, a pair of plates hinged to the wagon-body with their free ends within the space formed by the separated flanges of the first plate, a stop to limit the endwise movement of the flanged plate, and fastenings whereby the said flanged plate may be held in a straight or a laterally-deflected position, substantially as specified.

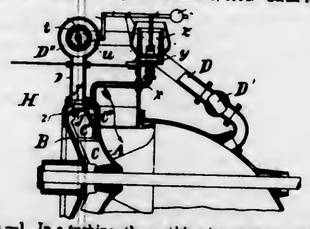


810,954. TOOTHPICK-HOLDER. WILHELM LOEWEN, Gintz, Germany, assignor to Alois Joseph Hettwer, Landeck, Germany. Filed Nov. 23, 1903. Serial No. 183,394.

Claim.—1. The combination with a divided receptacle for holding toothpicks, of a fixed frame in which the receptacle is mounted to slide, of a fixed vertical partition on the frame passing through the receptacle and provided with a groove along its upper edge above which the receptacle is raised to deposit a toothpick in the groove, and afterward lowered below the same to enable the toothpick to be removed, and a finger pivoted on the receptacle and arranged to eject as the receptacle is raised any used toothpick which may have been laid in the groove.

2. The combination with a receptacle and a vertical partition provided with a groove in its upper end, the receptacle and the partition being movable relatively to one another to cause the grooved upper end of the partition to pass through the upper wall of the receptacle, of means for ejecting any toothpick located in the groove from the groove when the grooved end is again caused to enter the receptacle.

810,955. MEANS FOR REGULATING TURBINES. ANDREAS LUND, Christiania, Norway. Filed Mar. 9, 1904. Serial No. 197,210.



Claim.—1. In a turbine, the combination with an axially-movable turbine-wheel, of a water-cushion to regulate the axial position of the wheel, means to vary the hydraulic pressure of said cushion on the wheel and means set in operation by the axial movement of the wheel to vary its speed, substantially as described.

2. In a turbine, the combination with an axially-movable turbine-wheel, of a water-cushion to regulate the axial movement of the wheel, means operated by the rotary movement of the wheel to vary the pressure and volume of the cushion, and means set in operation by the axial movement of the wheel to vary its speed, substantially as described.

3. In a turbine, the combination with an axially-movable turbine-wheel, of a water-cushion behind the wheel to regulate the axial movement of the wheel, a valve to control the hydraulic pressure of said cushion on the wheel and means set in operation by the axial movement of the wheel to vary its speed, substantially as described.

4. In a turbine, the combination with the casing having a draft-tube and the turbine-wheel, of a chamber formed back of the wheel, means to maintain a constant and separate circulation of water from between the wheel and casing through the chamber and into the draft-tube, and means to control the volume of water passing through the chamber and thereby controlling the pressure within the chamber, substantially as described.

5. In a turbine, the combination with an axially-movable turbine-wheel, of a chamber back of the wheel and containing a water-cushion, vanes back of the wheel in said chamber to act as a pump, a pipe connection between the chamber and the water-exit from the wheel, a valve in said pipe and means to operate the valve from the turbine-wheel, substantially as described.

6. In a turbine, the combination with an axially-movable turbine-wheel, of a chamber back of the wheel and containing a water-cushion, vanes in the chamber rotatable with the wheel to act as a centrifugal pump, a valve-controlled pipe connecting the chamber with the draft-tube, and mechanism between the turbine-wheel and the valve to automatically operate the latter, substantially as described.

7. In a turbine, the combination with an axially-movable turbine-wheel, of a water-cushion to counteract the axial thrust of the wheel, means to vary the hydraulic pressure of said cushion to axially move the wheel, and a brake actuated by the wheel, substantially as described.

8. In a turbine, the combination with an axially-movable turbine-wheel, of a water-cushion to counteract the axial thrust of the wheel, a stationary brake element and a cooperating brake element carried by the wheel, and means to automatically vary the hydraulic pressure of the water-cushion to axially move the turbine-wheel and operate the brake, substantially as described.

9. In a turbine, the combination with an axially-movable turbine-wheel, of a chamber back of the wheel and containing a water-cushion, vanes in the chamber secured to the wheel, a stationary brake-ring and a brake-ring secured to the wheel, and means to automatically vary the hydraulic pressure of the water in said chamber to axially move the wheel, substantially as described.

10. In a turbine, the combination with an axially-movable turbine-wheel, a penstock and a draft-tube; of a chamber back of the wheel, a pipe connecting the chamber to the draft-tube, a valve in said pipe, means to cause a difference in hydraulic pressures between the central and peripheral portion of said chamber and mechanism actuated by the peripheral hydraulic pressure to control said valve, substantially as described.

11. In a turbine, the combination with an axially-movable turbine-wheel and its casing, a penstock and a draft-tube, of a chamber back of the wheel connected to the draft-tube, a set of pump-blades on the back of the wheel in said chamber and a second set of pump-blades on the wheel to act on the water passing between the wheel and casing into the chamber, substantially as described.

12. In a turbine, the combination with an axially-movable turbine-wheel and its casing, a penstock and draft-tube, of a chamber back of the wheel connected to the draft-tube, blades in the back of the wheel in said chamber, a pipe connecting the chamber and draft-tube, a fixed brake member and a movable brake member coöperating therewith and operated by the axial movement of the wheel, substantially as described.

13. In a turbine, the combination with an axially-movable turbine-wheel and its casing, a penstock and a draft-tube, of a chamber back of the wheel, a pipe connecting the chamber and draft-tube, a valve in said pipe, a set of pump-blades on the wheel and in said chamber, a set of pump-blades to act on the water passing into the chamber from between the wheel and its casing and means to operate said valve actuated by the water pumped by the second set of blades, substantially as described.

14. In a turbine, the combination with an axially-movable turbine-wheel and its casing, a penstock and draft-tube, of a chamber back of the wheel, a pipe connecting the chamber and draft-tube, a valve in said pipe, a fixed brake member in the chamber and a coöperating brake member on the wheel, a set of pump-blades back of the wheel in the chamber, a set of pump-blades positioned to act on the water passing between the wheel and casing into the cham-

bar, a receptacle to receive water pumped by the second set of blades and mechanism operated by the varying water-level in said receiver to actuate the valve, substantially as described.

15. In a turbine, the combination with an axially-movable turbine-wheel, a penstock and a draft-tube; of a chamber back of the wheel, a pipe connecting the chamber to the draft-tube, two valves in said pipe, means to cause a difference of hydraulic pressure between the central and peripheral portions of said chamber, means to control one of the valves by the speed of the wheel and means to control the other by the hydraulic pressure in the peripheral part of the chamber.

810,956. SHOW-CASE. ROBERT G. LUTES, Portland, Oreg., assignor to The Lutes Manufacturing Co., Portland, Oreg., a Corporation. Filed Aug. 3, 1905. Serial No. 272,457.

Claim.—1. In a show-case, the combination with the glass wall-plate, of saddle-rails affixed to the top edges thereof, said rails consisting of a crown and integral flanges or lips arranged to embrace the upper edges of the glass wall-plates, and having integral vertical stud-pins on its crown, and the end sections of said saddle-rails being further made with integral corner portions *i* arranged to hold the front wall-plate by its upper corners; and a glass top plate provided with vertical cavities on its under side arranged to receive said stud-pins, and by so doing interlocking the top plate with the walls.

2. In a show-case the combination with the back or door frame, and front and end glass wall-plates of saddle-rails affixed to the top edges of said wall-plates, and consisting of a crown and integral flanges or lips arranged to embrace the upper edges of the glass wall-plates, and having integral vertical stud-pins on its crown; said rails being secured at their back ends to the back frame, and the end sections of said saddle-rails being further made with integral corner portions *i* arranged to hold the front wall-plate by its upper corners, and a glass top plate provided with vertical cavities on its under side arranged to receive said stud-pins, and by so doing interlocking the top plate with the walls.

3. A show-case, comprising a back or door frame having corner-posts, front and end glass wall-plates, saddle-rails affixed to the top edges of said wall-plates, and consisting of a crown and integral flanges or lips arranged to embrace the upper edges of the glass wall-plates, and having integral vertical stud-pins on its crown; said rails being secured at their back ends to the posts of the back frame, and the end sections of said saddle-rails being further made with integral corner portions *i* arranged to hold the front wall-plate by its upper corners; and a glass top plate provided with vertical cavities on its under side arranged to receive said stud-pins, and by so doing interlocking the top plate with the walls.

4. A show-case comprising a back or door frame, front and end glass wall-plates, the front corners of which overlap one the other, strips of woven material interposed between said overlapping corners, rails affixed on the top edges of said glass wall-plates and having vertical stud-pins, the rail-sections on the end walls being secured at their back ends to the back frame, and said end rail-sections being made with corner portions arranged to hold the front wall-plate by its upper corners, and a glass top plate provided on its under side with vertical cavities arranged to receive said stud-pins, and by so doing interlocking the top plate with the wall-plate.

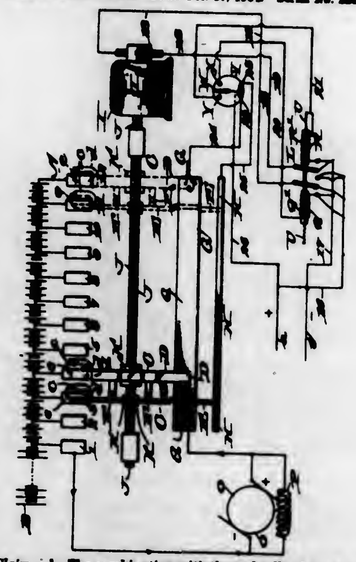
810,957. TIP FOR ROCKING-CHAIRS. THOMAS LYNCH, Jefferson, Iowa. Filed May 6, 1905. Serial No. 259,201.

Claim.—1. In a device of the class described, the combination with a rocker, of a holder having a clamp or clip arranged on the upper face of the rear end of the rocker and provided with an attachment-plate secured to the lower face of the rear end of the said rocker and arranged at an angle to the clip to form a crutch into which the rear end of the rocker fits, and a cushioning-tip or buffer held by the clamp or clip.

2. A device of the class described, comprising a holder provided with a clamp or clip and having an attachment portion arranged at an angle to the clamp or clip and forming a socket or crotch to receive the tip of a rocker, the clamp or clip being arranged to lie against the upper face of the rocker, means for securing the attachment portion to the lower face of the rocker, and a cushioning-tip or buffer arranged within the clip or clamp.

3. A device of the class described, comprising a holder constructed of a single piece of metal and composed of an attachment-plate adapted to be secured to the lower face of a rocker, and an inclined clip or clamp located at the outer end of the attachment-plate and forming a crotch to receive the end of the rocker, and a cushioning-tip or buffer secured within the clamp or clip and projecting beyond the ends and sides of the rocker.

810,958. END-CELL SWITCH. LAMAR LYNDON, New York, N. Y., assignor to General Storage Battery Company, New York, N. Y., a Corporation of New York. Filed Oct. 17, 1904. Serial No. 228,671.



Claim.—1. The combination with the end cells of a storage battery, of reversible charging means having a switch-brush, circuits and connections for automatically controlling the charging means in accordance with the electric condition of the end cells, whereby the brush is moved in either direction, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

2. The combination with the end cells of a storage battery, of reversible charging means having a switch-brush, circuits and connections for automatically controlling the charging means in accordance with the potential due to the electric condition of the end cells, whereby the brush is moved in either direction, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

3. The combination with the end cells of a storage battery, of reversible charging means having a switch-brush, circuits and connections for automatically controlling the charging means solely in accordance with the electric condition of the end cells, whereby the brush is moved in either direction, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

4. The combination with the end cells of a storage battery, and contacts connected thereto, of reversible charging means having a switch-brush, circuits and connections for automatically controlling the charging means in accordance with the potential existing between two of said contacts, whereby the brush is moved in either direction, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

5. The combination with the end cells of a storage battery, of a reversibly-movable charging-switch having a switch-brush, means automatically controlled in accordance with the electric condition of the end cells for actuating said brush, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

6. The combination with the end cells of a storage battery, of reversible automatic charging means having a switch-brush, circuits and connections whereby the position of the charging means is automatically changed to charge different cells as required, and means for automatically determining the position of the brush in accordance with variations in the electric condition of the end cells.

7. The combination with the end cells of a storage battery, of reversible automatic charging means having a switch-brush, circuits and connections so constructed and arranged that the charging means is moved to automatically recharge any or all of the cells as they become discharged beyond a predetermined amount, and means for automatically determining the position of the brush in accordance with the electric condition of the end cells.

8. The combination with the end cells of a storage battery, of a source of supply for charging the same, a reversible switch having a switch-brush controlling the charging of said end cells, means for actuating said switch, means controlled by the voltage of one or more of the end cells for automatically controlling the switch-actuating means, and means for automatically determining the position of the switch-brush in accordance with the electric condition of the end cells.

9. The combination of the end cells of a storage battery continuously connected to the work-circuit, charging means, and circuits and connections for automatically controlling the charging means in accordance with the electric condition of the end cells.

10. The combination with the end cells of a storage battery, of automatic charging means, controlling-circuits and connections so arranged and constructed that said automatic charging means is shifted from any set of end cells to any other set and back again as required, whereby any or all of the end cells are automatically recharged as they become discharged beyond a predetermined amount.

11. The combination with the end cells of a storage battery, of a source of supply for charging the same, a switch controlling the charging of said end cells, means for actuating said switch, and means controlled by the voltage of particular individual end cells undergoing charging for automatically controlling the switch-actuating means.

12. The combination with the end cells of a storage battery, of a source of charging-current, cell-contacts and bus-bars, a duplex brush having contact-arms insulated from each other and adapted to connect different cell-contacts to the bus-bars respectively, means for actuating the duplex brush along the contacts in either direction, and an electrical device controlled by the voltage between the bars due to the cells for controlling the operation of the brush-actuating means.

13. The combination with the end cells of a storage battery, of a series of contacts between which the end cells are connected, a main and auxiliary bus-bars, a main contact-arm adapted to connect successive contacts to a main bus-bar, an auxiliary brush connected to move with the main brush at a definite distance therefrom and arranged to connect successive contacts with an auxiliary bus-bar, an electrical device connected between the main and auxiliary bus-bars, and means for actuating the main and auxiliary brushes in either direction, said means being controlled by the electrical device connected between the bus-bars, said device operating in accordance with variations in voltage between said bars.

14. The combination with the end cells of a storage battery, of automatic charging means, controlling-circuits and connections therefor so constructed and arranged that the position of the said charging means is automatically changed to charge different cells as required, and means for preventing the short-circuiting of the cells as the automatic charging means is moved.

15. The combination with the end cells of a storage battery, of a source of charging-current, cell-contacts and bus-bars, a duplex brush having contact-arms insulated from each other and adapted to connect different cell-contacts to the bus-bars respectively, means for actuating the duplex brush along the contacts in either direction; an electrical device controlled by the voltage between the bars due to the cells for controlling the operation of the brush-actuating means, and electrical means connected to the arms of said duplex brush for preventing short-circuiting of the end cells as the brush moves.

16. The combination with the end cells of a storage battery, of an automatic charging-switch, controlling-circuits and connections therefor so constructed and arranged that the switch is moved to automatically charge the cells as required by the system, and means for preventing the stoppage of said switch in its movement before it reaches the proper position for charging.

17. The combination with the end cells of a storage battery, of a charging-switch, means automatically controlled by the electric condition of the cells for actuating said switch, and means for preventing the stoppage of the movement of the switch before the desired position is reached.

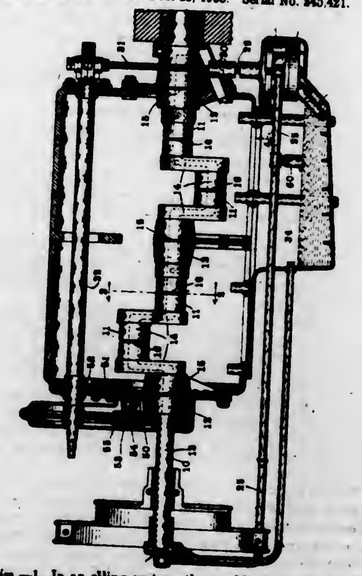
18. In an end-cell switch, the combination of at least two sets of auxiliary contacts, a switch-arm, means for actuating said arm, and circuits and connections so arranged that the switch-arm is actuated as long as said sets of auxiliary contacts are electrically connected, and continues to move to the desired position after said sets of contacts are disconnected.

19. The combination of the end cells of a storage battery permanently connected in series, automatic charging means, circuits and connections therefor so arranged and constructed that a variable number of said cells are inserted in the charging-circuit, and automatic means for controlling the position of said charging means in accordance with the electric condition of the end cells.

20. The combination with the end cells of a storage battery permanently connected in series, of automatic charging means, circuits and connections therefor so arranged that the charging means is moved to recharge the cells, and automatic means for determining the position of said charging means in accordance with the degree of charge in the individual cell which is last placed in circuit.

21. The combination with the end cells of a storage battery, of a charging-switch having a brush, automatic means for actuating said charging means, and circuits and connections so arranged and constructed that the movement of the brush is proportional to the change in the state of charge of the cells and in a direction to include all cells falling below a predetermined charge.

810,959. OIL SYSTEM. HOWARD C. MARMON, Indianapolis, Ind., assignor to Nordyke & Marmon Company, Indianapolis, Ind., a Corporation of Indiana. Filed Feb. 13, 1905. Serial No. 245,421.



Claim.—1. In an oiling system, the combination, with a bored rotating member; of a feeder for introducing oil thereinto compris-

ing, a main hollow casing provided with, an annulus arranged to slip over the end of the rotating member, a drip-chamber within the annulus, an inlet-chamber within the casing, a spiral groove formed in the interior of the annulus and leading in the direction of rotation of the shaft inward toward the drip-chamber, a tube within the annulus communicating with the inlet-chamber and extending into the bore of the rotating member, there being a spiral groove on the periphery of the inlet-tube and leading toward the inner end thereof in the direction of rotation of the rotating member; and an overflow-pipe leading from said first-mentioned chamber.

2. In an oiling apparatus, the combination, with a bored rotating member, of a feeder for introducing oil therein comprising; a main hollow casing provided with, an annulus arranged to slip over the end of the rotating member, a chamber within the annulus, an inlet-chamber within the casing, and a tube communicating with said inlet-chamber and extending into the bore of the rotating member; and an overflow-pipe leading from the first-mentioned chamber.

3. In an oiling apparatus, the combination, with a bored rotating member; of a feeder for introdneing oil thereinto comprising a main hollow casing provided with, an annulus arranged to slip over the end of the rotating member, a drip-chamber within the annulus, an inlet-chamber, a tube communicating with said inlet-chamber and extending into the bore of the rotating member, there being a spiral groove formed in the interior of the annulus and leading in the direction of rotation of the shaft inward toward the drip-chamber; and an overflow-pipe leading from said drip-chamber.

4. In an oiling apparatus, the combination, with a bored rotating member; of a feeder for introducing oil thereinto comprising a main hollow casing provided with an annulus arranged to slip over the end of the rotating member, a drip-chamber within the annulus, an inlet-chamber, a tube communicating with said inlet-chamber and extending into the bore of the rotating member, there beinga spiral groove running between the annulus and shaft inward toward the drip-chamber in the direction of rotation of the shaft; and an overflow-pipe leading from said drip-chamber.

5. In an oiling apparatus, the combination, with a bored rotating member, of a feeder for introducing oil thereinto comprising, a main hollow casing provided with an annulus arranged to slip over the end of the rotating member, a tube arranged concentrically within said annulus and extending into the bore of the rotating member, and an inlet leading into said tube.

6. In an oiling apparatus, the combination of a tubular rotating member and a tubular feeder telescoping therewith, said two parts having, between their coacting surfaces, a spiral groove leading in a direction to prevent leakage.

7. In an oiling apparatus, the combination of a tubular rotating member, and a compound tubular feeder, the inner tube of said feeder telescoping within the tubular member and the outer tube telescoping over the tubular member, and an eduction-passage leading from the inner end of the outer tubular portion of the feeder.

810,960. PROCESS FOR CLEANING GRAINS. HARVEY C. MILLER, Philadelphia, Pa. Filed June 18, 1904. Serial No. 213,114.

Claim.—1. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying the grains, then subjecting the grain in that condition to an abrading action.

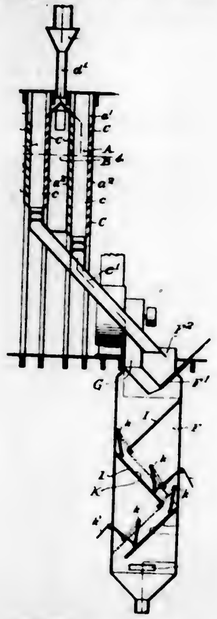
2. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying and cooling the grains, then subjecting the grains in that condition to an abrading action.

3. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying the grains, then subjecting the grain in that condition to an abrading action, and during said action carrying off the abraded material by a current of air.

4. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying and cooling the grains, then subjecting the grains in that condition to an abrading action, and during said action carrying off the abraded material by a current of air.

5. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying the grains, then subjecting the grain in that condition to an abrading action, and during said action carrying off the abraded material by a current of air, moving in a direction opposite to that of the movement of the grain.

6. The hereinbefore-described method of purifying and cleaning musty or dirty grains, which consists in first thoroughly drying and cooling the grains, then subjecting the grains in that condition to an abrading action, and during said action carrying off the abraded material by a current of air moving in a direction opposite to that of the movement of the grain.



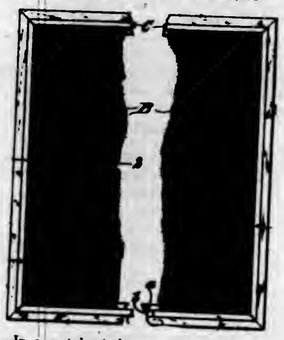
810,961. PITMAN CONNECTION. WILLIAM V. MILLER, Nyack, N. Y., assignor to Metropolitan Sewing Machine Company, Nyack, N. Y., a Corporation of New York. Filed Apr. 4, 1904. Serial No. 201,367.

Claim.—1. In combination, a driving member, a driven member and a frame supporting the two on axes at right angles to each other, a pitman connecting the two members, and a pivotal connection between the pitman and the driven member including a long journal-pin extending at a right angle to said member and pivotally connected to the pitman and having a swivel connection with the driven member.

2. In combination, a supporting-frame; a driving member journaled in said frame; a driven member also journaled in said frame; a pitman connecting the two members and pivotally joined to the driven member; the journal of the driven member being sleeved in and extending entirely through said frame, and the pivotal connection between the said member and said pitman being disposed in rear and centrally of the journal of said member, whereby the drive of the pitman will not disturb the balance of the said member nor cause it to bind at its journal.

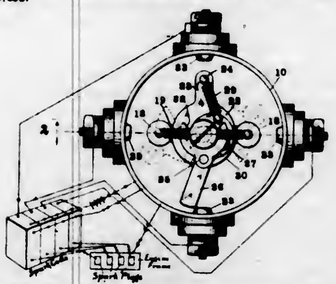
3. In combination, a supporting-frame; a driving member journaled in said frame; a driven member also journaled in said frame; a pitman connecting the two members, the connection between the pitman and the driven member consisting of an extended tubular bearing on the latter, an elongated pin journaled in said bearing and having an angular head, and a pivotal connection between said head and said pitman.

810,962. METAL WINDOW-SCREEN. ALLEN H. MIX, Burlington, Vt., assignor to Porter Screen Manufacturing Company, Burlington, Vt. Filed Nov. 14, 1905. Serial No. 287,373.



Claim.—In a metal window-screen, a hollow box-like sheet-metal frame-bar with parallel sides and top and bottom, the top formed by inturned limbs *a* extending toward each other in the same plane from opposite sides of the bar, with a longitudinal opening *b* between their opposed edges, in combination with a sheet-metal filling-strip, of substantially channel-bar or ⌊ cross-section to fit and fill said opening, and wire-cloth gripped between one side of the filling-strip and the opposed biting edge of the adjoining limb *a* of the bar, as and for the purposes hereinbefore set forth.

810,963. ELECTRIC IGNITER. HOMER N. MOTSINGER, Pendleton, Ind., assignor to Motsinger Device Manufacturing Company, Pendleton, Ind., a Corporation of Indiana. Filed May 31, 1904. Serial No. 210,455.



Claim.—1. In an electric igniter, the combination of, a casing carrying one or more terminals projecting beyond the path of movement of a contact-arm, a shaft journaled in said casing, a plate rotatably mounted on the shaft, the said contact-arm pivoted upon said plate eccentrically with relation to the shaft and extending substantially radially to cooperate with the casing-terminals, yielding means for holding said arm in normal position, speed-controlled means carried by said shaft, and connections between said speed-controlled means and said plate whereby the plate will be angularly shifted by movement of the speed-controlled means.

2. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically to the axis of rotation and extending substantially radially, and the other of said terminals projecting into the path of movement of the radially-projecting terminal between its end and its pivotal point, and means for yieldingly holding said pivoted terminal in normal position with relation to its carrier.

3. In an electric igniter, the combination of, a casing carrying one or more terminals, a shaft journaled therein, a normally radially extending contact-arm pivotally mounted upon said shaft eccentrically thereto and adapted to cooperate with the casing-terminals, and means for yieldingly holding said contact-arm in normal position.

4. In an electric igniter, the combination of, a casing carrying one or more terminals, a shaft journaled in said casing, a plate rotatably mounted on the shaft, a contact-arm pivoted upon said plate eccentrically with relation to the shaft and extending substantially radially to engage the terminal, yielding means for holding said arm in normal position, speed-controlled means carried by the shaft, connections between said speed-controlled means and said plate whereby the plate will be angularly shifted by movement of the speed-controlled means, and means for shifting the casing angularly upon the shaft.

5. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other and the said other normally fixed, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and projecting substantially radially, and the other extended into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminals in normal position with relation to its carrier, and means for angularly adjusting the normally fixed member with relation to the rotating member.

6. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation, and extending substantially radially, and the other extended into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminal in normal position with relation to its carrier, and speed-controlled means operated by the rotatable member for shifting one of the contact-terminals angularly.

7. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other and the other normally fixed, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and extending substantially radially, and the other extended into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminal in normal position with relation to its carrier, speed-controlled means operated by the rotatable member for angularly shifting the terminal carried by said rotatable member, and means for angularly adjusting the normally fixed member and its terminal.

8. In an electric igniter, the combination of, a casing carrying one or more terminals, a shaft journaled therein, a plate rotatably mounted on the shaft, a substantially radial contact-arm pivoted upon said plate eccentrically with relation to the shaft and radially extending therefrom, yielding means for holding said arm in normal position and capable of permitting movement of the arm in either direction, and a pair of governor-arms eccentrically pivoted upon the shaft and each having an inclined slot engaging a portion of said plate whereby said governor members will operate to shift the plate angularly upon the shaft.

9. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and extending subtantially radially, and the other of said members projected into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminal in normal position with relation to its carrier, and a second pair of contact-terminals carried by each of said members, said second pair being insulated from the first pair.

10. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other and the said other normally fixed, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and extending substantially radially, and the other of said members projected into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminals in normal position with relation to its carrier, speed-controlled means operated by the rotatable member for shifting one of the contact-terminals angularly, and a second pair of contact-terminals carried by said members and insulated from the first pair of contact-terminals.

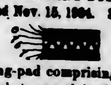
11. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and extend-

ing substantially radially, and the other of said members projected into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminal in normal position with relation to its carrier, speed-controlled means operated by the rotatable member for shifting one of the contact-terminals angularly, and a second pair of contact-terminals carried by said members and insulated from the first pair of contact-terminals.

12. In an electric igniter, the combination of, a pair of members one rotatable with relation to the other and the other normally fixed, a pair of contact-terminals one carried by each of said members and one of said terminals being pivoted eccentrically with relation to the axis of rotation and extending substantially radially, and the other of said members projected into the path of movement of the pivoted member between its end and its pivotal point, means for yieldingly holding said pivoted terminal in normal position with relation to its carrier, speed-controlled means operated by the rotatable member, means for angularly adjusting the normally fixed member and its terminal, and a second pair of contact-terminals carried by said members and insulated from the first pair of contact-terminals.

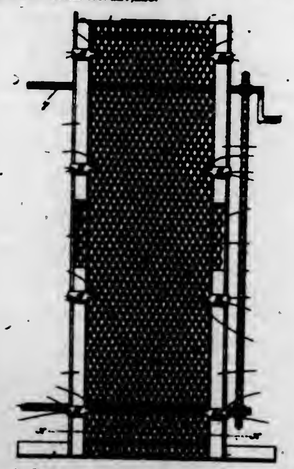
13. In an electric igniter, the combination of, a casing carrying two sets of one or more terminals, a shaft journaled therein, a plate rotatably mounted on the shaft, a radially-extending contact-arm pivoted upon said plate eccentrically with relation to the shaft and adapted to cooperate with one set of casing-terminals, yielding means for holding said arm in normal position and permitting movement of the arm in either direction, a pair of governor-arms eccentrically pivoted upon the shaft and each having an inclined slot engaging a portion of said plate whereby said governor members will operate to shift the plate angularly upon the shaft, and a second contact-arm carried by the shaft in position to cooperate with the other set of casing-terminals and insulated from the pivoted contact-arm.

810,964. SLEEVE-IRONING BOARD. JESSIE F. MCARTHUR, Detroit, Mich. Filed Nov. 15, 1904. Serial No. 232,849.



Claim.—An ironing-pad comprising a core formed of a corrugated sheet of asbestos between plain sheets of the same material, a covered padding over said core, and a removable cover fitting over the pad so formed.

810,965. SCREEN. WILLIAM W. MCCALLIP, Columbus, Ohio. Filed Oct. 5, 1904. Serial No. 227,220.



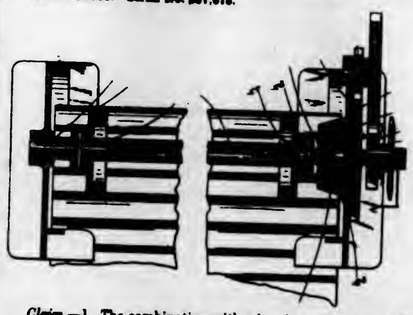
Claim.—1. In a screen, the combination of parallelly-adjustable side supports, and a screening fabric the strands composing which are permanently inclined to the edges thereof on said supports whereby said fabric is adjustable longitudinally and laterally without altering the angular relation of the edges thereof to each other.

2. In a screen, the combination of a rectangular frame having its opposite sides parallelly adjustable with respect to each other, and a screening fabric the strands composing which are permanently inclined to the edges thereof on said frame whereby said fabric is adjustable longitudinally and laterally without altering the angular relation of the edges thereof to each other.

3. In a screen, the combination of parallel side supports, means for adjusting them toward and from each other, a screening fabric adjustable longitudinally and laterally on the supports without altering the angular relation to each other of the sides of the fabric and movable clamping devices for holding the edges of the fabric on the supports.

4. In a screen, the combination of parallel side supports, means for adjusting them toward and from each other, a screen adjustable longitudinally and laterally on the supports, movable clamping devices for holding the edges of the screen on the supports, and hooks for engaging the screen.

810,966. ROLLER FOR FIREPROOF BLINDS OR CURTAINS. EDWARD H. MCCLOUD, Columbus, Ohio. Filed Nov. 10, 1904. Renewed Nov. 16, 1905. Serial No. 287,673.



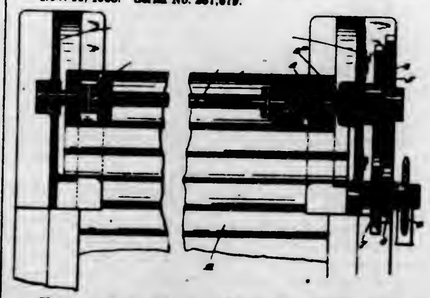
Claim.—1. The combination with a bearing or bracket, a shaft thereon, a gear loose on said shaft, a spring connecting the bearing and said gear, and means for turning the shaft and the gear at different rates of speed.

2. The combination with a bearing or bracket, a shaft thereon, a gear loose on said shaft, a spring connecting the bearing and said gear, a pinion fixed on said shaft and a gear and pinion intermediate the first-mentioned gear and pinion.

3. In combination, a curtain-roller, and curtain thereon, a shaft for said roller, a bearing or bracket for said shaft, a gear loose on said shaft, a spring connecting the bearing and said gear, and means for turning the shaft and the gear at different rates of speed.

4. In combination, a bearing or bracket, a curtain and roller therefor having its shaft supported in said bearing, a gear loose on said shaft, a spring connecting the bearing and said gear, a pinion fixed on said shaft, and a gear and pinion intermediate the first-mentioned gear and pinion.

810,967. ROLLER FOR FIREPROOF BLINDS OR CURTAINS. EDWARD H. MCCLOUD, Columbus, Ohio. Filed Nov. 11, 1904. Renewed Nov. 16, 1905. Serial No. 287,679.



Claim.—1. In combination with a bracket or bearing, a loose sleeve turning in said bearing, a winding-shaft turning in said sleeve, a spring connecting the winding-shaft and sleeve at one side of said bracket or bearing, and gears fast on the sleeve and shaft on the opposite side of said bracket or bearing, and means for imparting a differential motion to the sleeve and shaft.

2. In combination with a bracket or bearing, a loose sleeve turning in said bearing, a winding-shaft turning in said sleeve, a spring connecting the winding-shaft and sleeve at one side of said bracket or bearing, and gears fast on the sleeve and shaft on the opposite side of said bracket or bearing, and pinions to engage said gears adapted to impart motion to said shaft and sleeve at different rates of speed.

3. In combination with a bracket or bearing, a loose sleeve turning in said bearing, a winding-shaft turning in said sleeve, a spring connecting the winding-shaft and sleeve at one side of said bracket or bearing, a gear fast on said sleeve, a larger gear fast on said shaft, and pinions to engage said gears and turn them at different rates of speed.

4. In combination with a bracket or bearing, a loose sleeve turning in said bearing, a winding-shaft turning in said sleeve, a spring connecting the winding-shaft and sleeve and gears fast on the sleeve and shaft, and pinions to engage said gears adapted to impart motion to said shaft and sleeve at different rates of speed.

810,968. INSPIRATOR AND MIXER FOR GAS-BURNERS. JOHN W. MCKNIGHT, Hanover, Pa., assignor to Hanover Gas Regenerating Co., a Corporation of Pennsylvania. Filed Aug. 4, 1904. Serial No. 219,540.

Claim.—1. The inspirator and mixer for gas-burners comprising a frame having parts thereof adjustable toward and from each other by which the size of the frame is varied, and a fan supported in the frame, substantially as described.

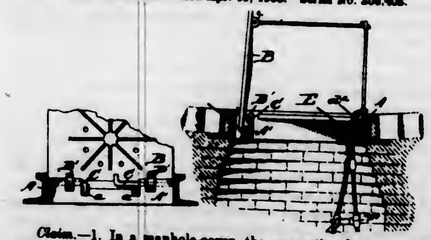
2. The inspirator and mixer for gas-burners comprising a spring-metal frame divided to render it capable of expansion and contraction with relation to size, provided with needle-point bearings, and a fan having a post formed with needle-point ends fitting in said bearings, substantially as described.

3. The inspirator and mixer for gas-burners comprising a frame expansible and contractible with relation to size, provided with needle-point bearings, and a fan having a post formed with needle-point ends fitting in said bearings, substantially as described.

4. The inspirator and mixer for gas-burners comprising an elastically-expansible frame adapted to be inserted and removed from a portion of the burner and to be held therein by expansion of the frame, a post carrying fan-blades, and bearings for the ends of the post supported by opposite members of the frame, substantially as described.

5. The inspirator and mixer for gas-burners consisting of a frame capable of insertion and removal from the combustion-chamber of a burner and consisting of an upright portion to bear against the wall of the chamber, and having horizontally-extending oppositely-disposed members provided with needle-point bearings on their inner faces, and a post carrying fan-blades and having its opposite ends tapered and fitting in said needle-point bearings, substantially as described.

810,969. MANHOLE COVER AND FRAME. MICHAEL H. O'DONNELL, Detroit, Mich. Filed Apr. 19, 1905. Serial No. 256,403.



Claim.—1. In a manhole-cover, the supporting-frame, a cross member having an inclined face, the cover hinged to said cross member, the construction being such that when the cover is forced open it will bear against the supporting-wall and cross member, substantially as described.

2. In a manhole cover and frame, the supporting-frame, provided with a cross member to which the cover is hinged, the construction of said frame and cross member being such that when the cover is forced upward it will stand at an angle when raised, whereby it will automatically return to its seat, substantially as described.

3. In a manhole cover and frame, the supporting-frame having a cross member to which the cover is hinged, the cover formed with hinge-lugs designed to enter suitable recesses in the cross member, hinge-pins adapted to enter apertures provided in the lugs of the cover and the cross member, said pins provided with means for locking them against displacement, substantially as described.

4. In a manhole cover and frame, the supporting-frame provided with a cross member to which the cover is hinged, the construction of said frame and cross member being such that when the cover is forced upward it will be restrained at an angle from which it will automatically return to its seat if otherwise unsupported, in combination with the guard-frame arranged to hold the cover up and guard the opening, substantially as described.

5. In a manhole cover and frame, the supporting-frame provided with a cross member to which the cover is hinged, the construction of said frame and cross member being such that when the cover is forced upward it will be restrained at an angle from which it will automatically return to its seat if otherwise unsupported, in combination with a guard-frame consisting of a rectangular upper section hinged to the cover, and two depending lugs supporting the rectangular frame from the corners when the cover is raised, substantially as described.

6. In a manhole-cover and frame the combination of the frame, the cover hinged to the frame and means consisting of a stop above the hinge on one side and a stop below the hinge on the other side to take the strain of the cover from the hinge, when the cover is forced open by the explosion of gas or other causes, substantially as described.

810,970. CARRIER-COVER FOR PNEUMATIC STORE-SERVICE. JOHN S. PALMER, Chicago, Ill. Filed May 1, 1905. Serial No. 258,160.

Claim.—1. In combination, a carrier-shell, an end ring fitted thereto and having an inner rabbet, and a lid hinged to the ring and fitting in said rabbet when closed.

2. In combination, a carrier-shell, and a lid hinged thereto and rotatable to expose either face when closed.

3. In combination, a carrier-shell, a spring-hinge fixed thereto, a lid rotatably mounted on the hinge, and a catch to hold the lid closed.

4. In combination, a carrier-shell, a flexible metal strip fixed within the end thereof and forming a hinge and having an outwardly-extending arm, a lid rotatably mounted on the arm, and a catch to hold the lid closed.

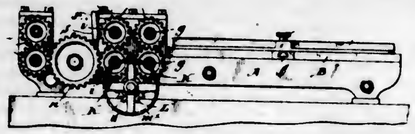
5. In combination, a carrier-shell, an end ring thereon having a notch, a lid hinged to the end ring, and a sliding button on the lid accessible from both sides thereof and having a finger adapted to engage the notch.

6. In combination, a carrier-shell, a lid thereon, which may be turned to expose either side when closed, and a catch carried by the lid and engageable with the shell, the catch being accessible from either side of the lid.

810,971. MACHINE FOR STRIPPING BLANKS FOR PAPER BOXES. LYNDON C. PALMER, Buffalo, N. Y. Filed Nov. 17, 1904. Serial No. 233,143.

Claim.—1. In a machine for stripping cardboard blanks or the like, the combination with a suitable frame, of a feeding device for feeding the blanks forward, and a stripping device in the path of the blank for reducing the thickness of the marginal portion of the latter so that the reduced marginal portion is of even thickness throughout.

2. In a machine for stripping a cardboard blank or the like, the combination with a frame, of feed-rolls revolubly mounted in the frame, and a stripping device in the path of the blank for reducing the thickness of the marginal portion thereof as it passes through the machine so that the reduced marginal portion is of even thickness throughout.



3. In a machine for stripping cardboard blanks or the like, the combination with a suitable frame, of feed-rolls revolubly mounted in the frame, and a stripping-knife located in the path of the blank as it leaves the feed-rolls, said knife having its cutting edge arranged substantially parallel with the face of the marginal portion of the blank to reduce the thickness thereof.

4. In a machine for stripping a cardboard blank or the like, the combination with a suitable frame, of feed-rolls and delivery-rolls revolubly mounted in the frame, and a stripping device lying in the path of the blank between the feed-rolls and the delivery-rolls, and adapted to reduce the thickness of the marginal portion of the blank.

5. In a machine for stripping the marginal portion of a scored cardboard blank, the combination with a frame, of a stripping-knife carried on the frame, and means for flexing the marginal portion of the blank and feeding the blank to said stripping-knife.

6. In a machine for stripping the marginal portion of a cardboard blank scored near one edge, the combination with a frame, of feed and flexing rolls revolubly mounted in the frame to flex said marginal portion and separate the layers of the same from the score-line toward the edge of the blank, and means for stripping the marginal portion of the blank as it leaves the feed and flexing rolls.

7. In a machine for stripping the marginal portion of a cardboard blank scored near one edge, the combination with a frame, of a pair of rolls between which said blank is passed, one of said rolls being longer than the other and having a flexing-rim at its outer end adapted to flex that portion of the blank extending beyond the end of the other roll to separate the layers of the blank from the score-line toward the edge of the same, and a stripping-knife in the path of the blank as it leaves said rolls.

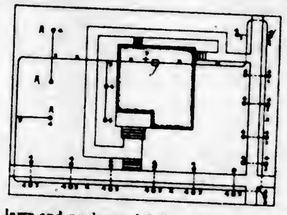
8. In a machine for stripping the marginal portion of a cardboard blank scored near one edge, the combination with a frame, of a pair of rolls arranged one above the other between which said blank is passed, the upper of said rolls being longer than the lower roll and having a circumferential groove and a flexing-rim at its outer end, said rim serving to flex that portion of the blank extending beyond the end of the lower roll to separate the layers of the blank from the score-line toward the edge of the same, and a stripping-knife in the path of the blank as it leaves the said rolls.

9. In a machine for stripping the marginal portion of a cardboard blank scored near one edge, the combination with a frame, of a pair of rolls arranged one above the other between which said blank is passed, the upper of said rolls being longer than the lower roll and having a circumferential groove and a flexing-rim at its outer end, said rim serving to flex that portion of the blank extending beyond the end of the lower roll to separate the layers of the blank from the score-line toward the edge of the same, a platform in rear of said rolls provided with a depression in line with the flexing ends of said rolls, and a stripping-knife having its cutting-blade extending into said depression.

10. In a machine for stripping the marginal portion of a cardboard blank scored near one edge, the combination with a frame, of a pair of feed and flexing rolls revolubly mounted in said frame, the upper roll thereof having an end flexing-rim and a circumferential groove forming a gage edge and the lower roll thereof extending slightly beyond said gage edge, a second pair of revolubly-mounted similar rolls having the gage edge of the upper roll in line with the gage edge of the upper roll of the first-mentioned pair of rolls and the adjacent end of the lower roll extending beyond the corresponding end of the lower roll of the first-mentioned pair of rolls, and a stripping-knife in rear of said rolls in line with the flexing ends of the latter.

810,972. SYSTEM FOR SPRINKLING LAWNS, GARDENS, GREENHOUSES, PARKS, &c. FRANK H. PARADISE, Denver, Colo. Filed Dec. 14, 1904. Serial No. 236,779.

Claim.—1. In a lawn and garden sprinkling apparatus, the combination of a supply-pipe with actuating-cable, and sprinkler-valves; said actuating-cable being within the supply-pipe and sprinkler-valves; a cable-operating device, and sprinklers, substantially as set forth.



2. In a lawn and garden sprinkling apparatus, the combination of a supply-pipe with actuating-cable having attached thereto valve-lever-engaging projections; and sprinkler-valves with actuating-cable-engaging levers; said actuating-cable being within, and when in operation, moving through said supply-pipe and sprinkler-valves; a cable-operating device, and sprinklers, substantially as set forth.

810,973. DISINFECTING DEVICE FOR SINK-DRAINS. ALEXANDER PATTERSEN and ANNIE B. PATTERSEN, Buffalo, N. Y. Filed Jan. 3, 1905. Serial No. 239,453.

Claim.—1. In a disinfecting device for sink-drains, the combination with a strainer-plate, of a support affixed to said strainer-plate, a receptacle for disinfectant adjustably held on said support, and a hood adapted to cover the strainer-plate and inclose said receptacle.

2. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a support affixed to said strainer-plate, receptacle for disinfectant adjustably held on said support, and a bell-shaped hood adapted to cover the strainer-plate and having its edge notched and provided with inwardly-swinging gates.

3. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a support detachably connected to said strainer-plate, a receptacle for disinfectant adjustably held on said support, a bell-shaped hood adapted to cover the strainer-plate and having a series of openings at its lower end, and inwardly-opening gates pivotally affixed to said hood to normally close said openings.

4. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a screw-threaded stem affixed to said strainer-plate, a nut adjustable on said stem, a receptacle for disinfectant fitting loosely on said stem and receiving support from said nut, a bell-shaped hood fitting loosely on said stem and being supported on said receptacle, and a nut at the upper end of said stem for securely holding the parts together.

5. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a screw-threaded stem having its lower end reduced and bent, and passed through one of the openings of said strainer-plate to bear against the under side of the same, a nut on said stem bearing against the upper side of the strainer-plate, and a hood adapted to cover the strainer-plate.

6. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a screw-threaded stem having its lower end reduced and bent, said reduced and bent end being passed through one of the openings of said strainer-plate to bear against the under side of the same, and a hood supported on said stem and adapted to cover the strainer-plate.

7. In a disinfecting device for sink-outlets, the combination with the strainer-plate, of a screw-threaded stem having its lower end reduced and bent at a right angle, said bent end being passed through one of the openings of said strainer-plate to bear against the under side of the same, a nut on said stem bearing against the upper side of the strainer-plate, a receptacle adjustable on said stem, and a hood inclosing said receptacle and adapted to cover the strainer-plate.

8. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a screw-threaded stem having its lower end reduced and bent at a right angle, said bent end being passed through a perforation in said strainer-plate to bear against the under side of the same, a nut on said stem bearing against the upper side of the strainer-plate, a nut adjustable on said stem, a receptacle for disinfectant fitting said stem loosely and receiving support from the last-mentioned nut, a hood adapted to receive support from said receptacle and having an opening through which said stem projects, and a nut threaded onto the projecting end of said stem.

9. In a disinfecting device for sink-drains, the combination with the strainer-plate, of a screw-threaded stem having its lower end reduced and bent at a right angle, said bent end being passed through a perforation in said strainer-plate to bear against the under side of the same, a nut on said stem bearing against the upper end of the strainer-plate, a second nut adjustable on said stem, a perforated receptacle for disinfectant fitting said stem loosely and receiving support from the last-mentioned nut, a hood adapted to cover the strainer and to receive support from the disinfectant-receptacle, said hood having its lower edge notched, inwardly-opening gates normally fitting said notches and having flanges at opposite sides that bear against the hood to limit outward movement of the same, and means for clamping the disinfectant-receptacle and the hood together.

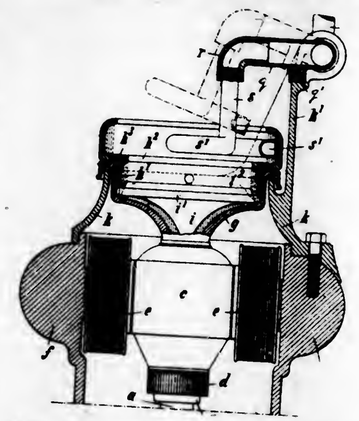
810,974. DRYING-KILN. ELMER E. PERKINS, Melrose, Mass. Filed Dec. 3, 1904. Serial No. 235,900.

Claim.—1. In a drying-kiln, a closed housing having an upright partition dividing it into a drying-chamber and an adjacent compartment of relatively large cross-sectional area communicating therewith at its upper end, a double bottom for the chamber, directly connected with the lower end of said compartment and having inlets into the chamber increasing in area as they are farther from the compartment, curved guides adjacent the inlets to direct the air as it enters the chamber, a condenser in the compartment, and heating means adjacent the inlets into the chamber, the alternate heating and cooling on opposite sides of the partition causing a continuous and free air-current through the chamber, the variations in the areas of the inlets and the curved guides distributing the incoming air uniformly throughout the chamber, and preventing the formation of eddies and dead-spaces.

2. In a drying-kiln, a closed housing having an upright partition dividing it into a drying-chamber and an adjacent compartment of relatively large cross-sectional area communicating therewith at its upper end, a double bottom for the chamber, directly connected with the lower end of said compartment and having inlets into the chamber increasing in area as they are farther from the compartment, curved guides adjacent the inlets and extending both above and below the plane in which the inlets are located, to direct the air as it enters the chamber, a condenser in the compartment, and heating means adjacent the inlets into the chamber, the alternate heating and cooling on opposite sides of the partition causing a continuous and free air-current through the chamber, the variations in the areas of the inlets and the curved guides distributing the incoming air uniformly throughout the chamber, and preventing the formation of eddies and dead-spaces.

3. In a drying-kiln, a closed housing having a transversely-curved roof and an upright partition dividing the housing into a drying-chamber and an adjacent condensing-compartment communicating therewith at its upper end, a double bottom for the chamber, having a direct and curved connection with the lower end of said compartment and having inlets into the chamber increasing in area as they are farther away from the compartment, curved guides adjacent the inlets to direct the air as it enters the chamber, and heating means adjacent said inlets, the alternate heating and cooling on opposite sides of the partition causing a continuous and free air-current through the chamber, the variations in the areas of the inlets and the curved guides distributing the incoming air uniformly throughout the chamber, and acting, with the curved roof and the curved connection between the compartment and the double bottom of the chamber, to prevent the formation of eddies and dead-spaces.

810,975. CENTRIFUGAL PUMP. JOACHIM H. C. PETERSEN, Hamburg, Germany. Filed Nov. 11, 1904. Serial No. 232,371.



Claim.—1. In combination with a centrifugal pump, and its suction-head, a discharge-pipe, and a skimming device communicating with the discharge-pipe adapted to be swung into and out of the suction-head.

2. In combination with a centrifugal pump and its suction-head, a supporting element, a discharge-pipe supported by said element and a skimming device communicating with the discharge-pipe and adapted to revolve around the supporting element.

3. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe, a conduit pivotally supported in the standard communicating with the discharge-pipe, and a spiral conduit carried by and communicating with the aforesaid conduit adapted to take into the suction-head.

4. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe, a conduit pivotally supported in the standard communicating with the discharge-pipe, and a communicating conduit eccentric to the vertical axis of the mouth of the aforesaid conduit.

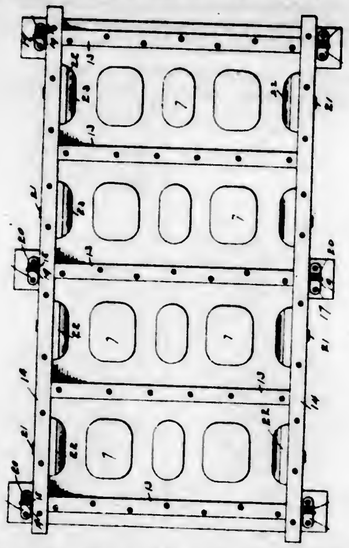
5. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe, a conduit pivotally supported in the standard communicating with the discharge-pipe, and a conduit communicating with the aforesaid conduit-opening at the periphery of the suction-head.

6. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe mounted therein, a hollow plug rotatably mounted in the standard communicating with the discharge-pipe, a nozzle carried by the plug, and a spiral conduit carried by the nozzle having its mouth terminating at the periphery of the suction-head.

7. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe mounted therein, a hollow plug rotatably mounted in the standard and communicating with the discharge-pipe, a nozzle carried by and communicating with the plug, means to limit the rotation of the plug, a conduit communicating with the nozzle having a spiral portion opening into the suction-head near its inner periphery.

8. In combination with a centrifugal pump and its suction-head, a standard, a discharge-pipe mounted therein, a hollow plug rotatably mounted in a socket formed in the standard and communicating with the discharge-pipe, means to adjust the plug in the socket, a nozzle entering the plug at right angles to the mouth of the discharge-pipe, a conduit entering the nozzle at right angles to the longitudinal axis of the nozzle and having a spiral portion bent in a plane at right angles to its axis, said spiral portion opening at the periphery of the suction-head, and means to hold the spiral portion in a longitudinal plane.

810,976. MOLD FOR BUILDING-BLOCKS. WILLIAM PORTER, St. Paul, Minn. Filed June 13, 1904. Serial No. 212,966.



Claim.—1. The combination, with a suitable frame, of removable floors having a series of core-holes arranged thereon, cores fitting within said holes, means for supporting said cores, side walls mounted on said platform, and partition or cross walls hinged at their lower edges to said frame and adapted to be swung down to a horizontal position, for convenience in emptying the molds, and a rigid cross-wall arranged intermediate to said hinged cross-walls, substantially as described.

2. In a mold for building-blocks, a frame having a series of cross-bars in rows at intervals thereon, a fixed partition-wall provided on the middle bar, and a series of partition-walls hinged upon each side of said fixed wall.

3. In a mold for building-blocks, the combination, with a frame provided with a series of cross-bars arranged with a space between them thereon, side and partition walls, and removable floors provided on said bars between said partition-walls and having a series of core-holes, and cores temporarily supported within said core-holes, substantially as described.

4. In a mold for building-blocks, the combination, with a frame, of side and partition walls thereon, a removable floor having a series of core-holes and cross-bars resting upon said frame and forming a space between it and said removable floor, and retaining-straps provided on said side walls opposite the ends of said movable floor.

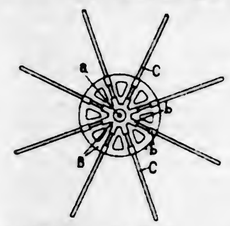
5. A mold for building-blocks comprising a frame having a series of cross-bars arranged at intervals with spaces between them, a series of partition-walls arranged lengthwise on said cross-bars, the middle wall of the series being fixed and the others being hinged at their lower edges to their respective bars, removable floors having a series of core-holes arranged upon said bars between the pairs of partition-walls, cores fitting within said holes, means for temporarily supporting said cores in said holes, and side walls connecting the ends of said partition-walls, substantially as described.

6. In a mold for building-blocks, the combination, with a frame provided with side and partition walls forming a series of molds, each mold having an open bottom, removable floors fitting within said molds and each having a series of core-holes oval in form, extending lengthwise thereof above the open bottoms of said molds, cores tapered from the bottom toward the top arranged to be inserted in to said holes from beneath, and means for temporarily supporting said cores in said holes.

7. A mold for building-blocks comprising a frame having a series of cross-bars arranged at intervals with spaces between them, partition-walls arranged lengthwise upon said bars, removable floors resting upon said bars over the spaces between them and having a series of core-holes, cores adapted to be inserted into said holes from beneath through said spaces, means for temporarily supporting said cores in said holes, and side walls connecting the ends of said partition-walls, substantially as described.

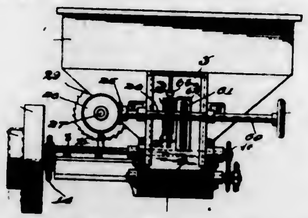
8. The combination, with a frame provided with standards 4 on each side and cross-bars 4' connecting said standards there being a space provided between said cross-bars, side and partition walls supported upon said bars, the middle partition-wall being rigidly secured to its bar, and the partition-walls intermediate to said middle one and the ends of said mold being hinged on their bars, removable floors arranged between said partition-walls and having core-holes therein, and means for supporting cores in said holes, substantially as described.

810,977. WINDING-REEL. GEORGES POURE, Boulogne-sur-Mer, France. Filed Oct. 13, 1903. Serial No. 127,155.



Claim.—A metallic reel consisting of an axle, a disk of sheet metal on each end thereof, each of said disks having hollow stamped ribs projecting alternately on both sides thereof forming radial passages, metallic rods having their ends placed in the passages and held therein by squeezing the ribs on both sides of the disk against the rods so as to slightly bend and flatten said rods, substantially as described.

810,978. FEED-GOVERNOR FOR MILLS, &c. CHARLES H. RICHARDS and ALBERT J. RICHARDS, Elgin, Ill. Filed Jan. 2, 1904. Serial No. 187,407.



Claim.—1. In a feed-governor for mills, &c., the combination of a valve, a rack-bar, a yielding connection between said rack-bar and valve, a pinion engaging said rack-bar, an adjustable stop for limiting the movement of said pinion with relation to the rack-bar, and means for rotating said pinion in either direction according to the speed of the mill.

2. In a feed-governor for mills, &c., the combination of a valve, two rack-bars on said valve, one of which is movable longitudinally with relation to the other, frictional means for connecting said movable bar to the valve, two pinions engaging said rack-bars respectively, each for moving said valve, a hand-operating means connected with one of said pinions and an automatic governor connected with the other of said pinions for causing it to rotate in either direction.

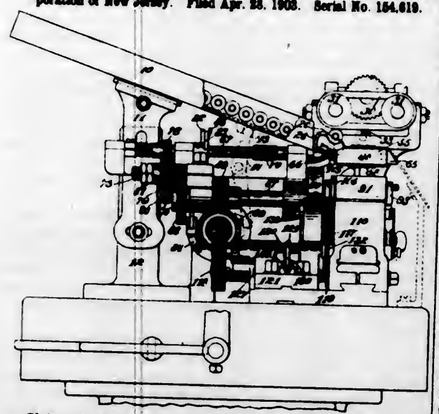
3. In a feed-governor for mills, &c., the combination of a valve, a centrifugal governor comprising a pulley, a shaft on which said pulley is mounted, a second shaft passing through said first shaft and being movable longitudinally therein and rotatable therewith, two governor-weights revoluble with said first shaft, two bell-crank levers connected with said governor-weights respectively, a cross-bar secured to said internal shaft and projecting from said first shaft on both sides thereof, and engaging said bell-cranks, and means whereby said valve is moved in either direction by the rotation of said internal shaft, and according to the direction of longitudinal movement of said internal shaft.

4. In a feed-governor for mills, &c., the combination of a hopper having a horizontal feed-opening, a feed-valve in the side thereof, a horizontal rotatable feed-accelerator journaled in said hopper and comprising two paddles and a body portion, the outer face of said paddles being formed at a tangent to said body portion, and means for rotating said feed-accelerator with said tangent faces toward the feed-opening.

5. In a feed-governor for mills, &c., the combination of a valve, means for moving said valve in either direction, comprising a shaft, two ratchet-wheels on the said shaft, having two series of ratchet-teeth each extending entirely around its wheel and being turned in opposite directions, pawls for engaging said ratchet-teeth respectively, and means for actuating said pawls, and governing mechanism for throwing said pawls alternately into action according to the speed of the mill.

6. The combination of a hopper having a longitudinal feed-opening in the side thereof, a rotatable feed-accelerator journaled in said hopper and having its axle parallel with said feed-opening, and comprising a body portion and a paddle, said paddle extending longitudinally of said feed-opening and having a flat side arranged at a tangent to the axle of rotation of the feed-accelerator, and means for rotating said feed-accelerator with its flat tangent side toward said feed-opening.

810,979. MARKING-MACHINE. FRANCIS H. RICHARDS, Hartford, Conn., assignor to American Cigar Company, New York, N. Y., a Corporation of New Jersey. Filed Apr. 23, 1903. Serial No. 154,619.



Claim.—1. In a marking-machine, the combination of a normally stationary marking-surface, means for rolling articles against the marking-surface, and means for shifting the marking-surface for supplying marking material thereto, substantially as described.

2. In a marking-machine, the combination of a marking-surface, means for rolling articles against the marking-surface while the latter is stationary, and means for applying marking material to the marking-surface, substantially as described.

3. In a marking-machine, the combination of a plurality of marking-surfaces, means for bringing said marking-surfaces successively into and holding them stationary in marking position, means for rolling articles against said marking-surfaces when in marking position, and means for applying marking material to the marking-surface when not in marking position, substantially as described.

4. In a marking-machine, the combination of a plurality of marking-surfaces, means for moving said marking-surfaces successively into and holding them stationary in marking position, means for rolling articles against said marking-surfaces when in marking position, and means for preparing the marking-surfaces for marking when not in marking position, substantially as described.

5. In a marking-machine, the combination of a marking-head having a plurality of marking-surfaces, means for intermittently rotating said head to bring the marking-surfaces successively into marking position, means for rolling articles against said marking-surfaces when in marking position, and means for preparing the marking-surfaces for marking when not in marking position, substantially as described.

6. In a marking-machine, the combination of a marking-surface, a moving surface opposed to the marking-surface for rolling articles against the marking-surface, means for shifting the marking-surface for supplying marking material thereto, and means for supplying a succession of articles in position to be rolled against the marking-surface by said moving surface, substantially as described.

7. In a marking-machine, the combination of a normally stationary marking-surface, means for rolling articles against the stationary marking-surface, means for shifting the marking-surface for supplying marking material thereto, and means for supplying to said rolling means a succession of articles to be marked, substantially as described.

8. In a marking-machine, the combination of a normally stationary marking-surface, means for rolling articles against the stationary marking-surface, means for applying marking material to the marking-surface, an oscillating feed-trough for feeding articles to said rolling means, and means for supplying articles to the feed-trough, substantially as described.

9. In a marking-machine, the combination of a marking-surface, a moving surface opposed to the marking-surface for rolling articles against the marking-surface, a feed-chute 10, and an oscillating trough 20 for receiving the articles from the chute and moving them into position to be engaged by the moving surface, substantially as described.

10. In a marking-machine, the combination of a marking-surface, a plurality of endless cushion-belts for rolling articles against the marking-surface, and means for supplying a succession of articles to be marked in position to be engaged by said belts, substantially as described.

11. In a marking-machine, the combination of a marking-surface, a plurality of endless cushion-belts for rolling articles against the marking-surface, and means for adjusting the belts toward and from the marking-surface, substantially as described.

12. In a marking-machine, the combination of a support, means for rolling articles against the support, a marking-surface adjacent to the support and opposed to the rolling means in position to engage the articles as they are rolled against the support, and means for shifting the marking-surface independently of the support for supplying marking material thereto, substantially as described.

13. In a marking-machine, the combination of a support, means for rolling articles against the support, and a marking-surface supported adjacent to the support and opposed to the rolling means to engage the articles beyond the line of engagement of the rolling means and of the support therewith, substantially as described.

14. In a marking-machine, the combination of a supporting member, means for rolling articles against said supporting member, a member having a marking-surface in position to engage the articles as they are rolled against the supporting member, and means for moving one of said members longitudinally of the direction of movement of the articles thereagainst, while the article is being rolled thereagainst, substantially as described.

15. In a marking-machine, the combination of a support, means for rolling articles against the support, a marking-surface in position to engage the articles as they are rolled against the support, and means for moving the support longitudinally of the direction of movement of the articles thereagainst while an article is being rolled thereagainst, substantially as described.

16. In a marking-machine, the combination of a support, means for rolling articles against the support, a marking-surface in position to engage the articles as they are rolled against the support, and means for moving the support longitudinally of and in the direction of movement of the articles thereagainst while an article is being rolled thereagainst, substantially as described.

17. In a marking-machine, the combination of a yielding support, means comprising a member moving past the support for rolling articles against the support, and a marking-surface supported adjacent to the support and opposed to said member in position to engage the articles as they are rolled against the support, substantially as described.

18. In a marking-machine, the combination of a support having an article-engaging surface formed of felt or the like, means comprising a member moving past the support for rolling articles against the support, and a marking-surface supported adjacent to the support and opposed to said member in position to engage the articles as they are rolled against the support, substantially as described.

19. In a marking-machine, the combination of a yielding support, means comprising a yielding article-engaging member moving past the support for rolling articles against the support, and a marking-surface supported adjacent to the support in position to engage the articles as they are rolled against the support, substantially as described.

20. In a marking-machine, the combination of a marking-head having a plurality of marking-surfaces adapted to be rotated to bring the marking-surfaces successively into marking position, means for

rolling articles against the marking-surfaces when in marking position, a constantly-rotating member, friction driving means between said member and the marking-head, and stop mechanism for permitting intermittent rotation of the marking-head, substantially as described.

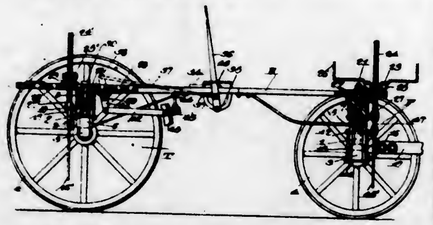
21. In a marking-machine, the combination of a normally stationary marking-surface, means for rolling articles against the stationary marking-surface, means for shifting the marking-surface into position to have marking material applied thereto, and a revolving rotatable roll for applying marking material to the marking-surface, substantially as described.

22. In a marking-machine, the combination of a marking-surface, means for rolling articles against the marking-surface, means for shifting the marking-surface into position to have marking material applied thereto, and a yieldingly-mounted revolving rotatable roll for applying marking material to the marking-surface, substantially as described.

23. The combination with a marking-head, of a support for one end of the marking-head, an endwise-movable member for supporting the other end of the marking-head, means for rotating said member, and means for holding said member normally in supporting position, substantially as described.

24. A marking-head formed of a body portion 55 having a pair of retaining-flanges 56, a holder 57, and a bottom strip 60, substantially as described.

810,980. LOGGING-WAGON. JAMES L. RIDDLE, Logana, Ky. Filed June 19, 1905. Serial No. 265,977.



Claim.—1. A reach member, a front truck, a king-bolt extending through and connecting said reach and front truck, a rear truck adjustably connected with the reach, a lifting-screw extending through the front end of the reach in advance of the front truck, and a lifting-screw adjustable in one of a plurality of perforations in the reach in rear of the rear truck.

2. In a logging-wagon, a pair of trucks, a reach supported upon said trucks, a bearing-plate upon the front end of the reach said bearing-plate and reach being provided with registering apertures, a king-bolt extending through the bearing-plate and reach and connecting the latter with the front truck, a lifting-screw extending through the bearing-plate and reach in front of the front truck, and a nut engaging the screw adjacent to the bearing-plate.

3. A truck including an axle and a bolster connected therewith said bolster having shoulders at the ends thereof, plates and bolts connecting said axle and bolster said plates having forward extensions terminating in ears having alining perforations, tongue-hounds including spaced plates and interposed segmental spacing-blocks, and bolts pivotally connecting the hound-plates with the perforated ears of the plates connecting the axle and bolster.

810,981. SOUND-BOX FOR TALKING-MACHINES. BENTLEY L. RENSHART, Camden, N. J., assignor to Victor Talking Machine Company, a Corporation of New Jersey. Filed July 26, 1900. Serial No. 25,043.

Claim.—1. In a sound-box for talking-machines, a stylus-bar and means for positioning said stylus-bar upon said sound-box so as to allow oscillation thereof, said means being made operative solely by the downward pressure upon the record, caused by the weight of the sound-box and parts thereby carried.

2. In a sound-box for talking-machines, a stylus-bar, and pivot-bearings having parts located respectively upon the stylus-bar and sound-box casing and being held in operative contact solely by the downward pressure upon the record caused by the weight of the sound-box and parts carried thereby.

3. In a sound-box for talking-machines, a stylus-bar and a pivot-bearing therefor, comprising parts located respectively upon the stylus-bar and sound-box casing and having a grooved bearing and coacting pivot, said pivot being held operatively against said bearing solely by the downward pressure upon the record caused by the weight of the sound-box and parts carried thereby.

4. In a sound-box for talking-machines, a stylus-bar, pivot-bearings therefor, comprising grooved parts opening in opposite directions and studs coöperating with said parts and held operatively within said grooves solely by the downward pressure upon the record caused by the weight of the sound-box and parts carried thereby.

5. In a sound-box for talking-machines, a stylus-bar, a fulcrum therefor comprising grooved parts opening in opposite directions and trunnions coöperating therewith and held operatively within said grooves by the downward pressure upon the sound-record caused by the weight of the sound-box and parts carried thereby.

6. In a sound-box for talking-machines, a stylus-bar, a fulcrum therefor comprising parts having V-shaped grooves opening in opposite directions and trunnions coöperating therewith and held operatively within said grooves by the downward pressure upon the record caused by the weight of the sound-box and parts carried thereby.

7. In a sound-box for talking-machines, a stylus-bar, having trunnions, a fulcrum therefor comprising grooved screws adapted to receive said trunnions and to bear upon the same upon opposite sides of the axis thereof, said trunnions being retained in the grooves by the downward pressure upon the record caused by the weight of the sound-box and parts carried thereby.

8. In a sound-box for talking-machines, a stylus-bar, trunnions carried thereby, grooved screws carried by the sound-box casing, said grooves having V-shaped sides adapted to contact with said trunnions, to hold the stylus-bar in position by the downward pressure upon the sound-record caused by the weight of the sound-box and parts carried thereby and means for locating said trunnions longitudinally.

9. In a sound-box for talking-machines, a stylus-bar, trunnions carried thereby, screws carried by the sound-box casing having V-shaped grooves therein to receive said trunnions, said screws being arranged upon opposite sides of the normal axis of said trunnions so that the stylus-bar is held in position by the downward pressure upon the sound-record, caused by the weight of the sound-box and parts carried thereby.

10. In a sound-box for talking-machines, a stylus-bar, a fulcrum therefor, and yielding material interposed between said fulcrum and its bearing.

11. In a sound-box for talking-machines, a stylus-bar, a fulcrum therefor and a cushioned bearing for said fulcrum.

12. In a sound-box for talking-machines, a stylus-bar, a fulcrum therefor, a bearing for said fulcrum and a cushion of yielding material interposed between said fulcrum and said bearing.

13. In a sound-box for talking-machines, a stylus-bar, trunnions carried thereby, bearings carried by the sound-box casing and having recesses therein to receive said trunnions, and sleeves of yielding material covering said trunnions.

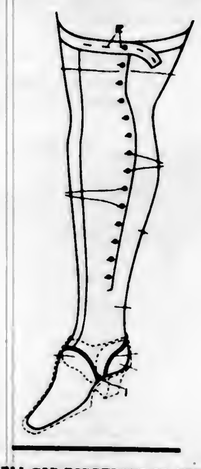
14. In a sound-box for talking-machines, a stylus-bar, trunnions carried thereby, bearings carried by the sound-box casing and having V-shaped grooves therein to receive said trunnions, and sleeves of yielding material covering said trunnions, said trunnions being held in said grooves by the downward pressure upon the record caused by the weight of the sound-box and attached parts.

15. In a sound-box for talking-machines, a stylus-bar and bearings therefor, the parts of said bearings being normally out of operative engagement and held in operative engagement by the contact of the stylus with the record.

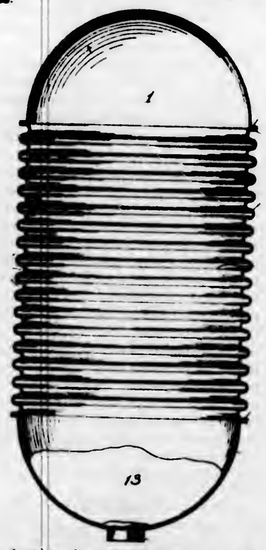
810,982. LEGGING. MOSES ROSENWASSER, New York, N. Y. Filed June 26, 1905. Serial No. 267,020.

Claim.—A legging formed to fit about the limb and ankle of the wearer, having an opening extending from the top portion downwardly and ending at a point substantially above the ankle portion, fastening devices for said opening, and a strap depending from said closed ankle portion and extending beneath the foot of the wearer.

810,982.



810,983. SHELL FOR TORPEDOES OR SIMILAR PURPOSES. THOMAS F. ROWLAND, New York, N. Y. Filed Oct. 21, 1903. Serial No. 177,923.

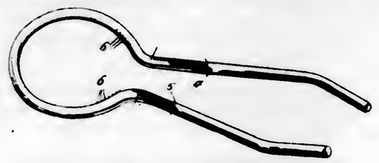


Claim.—1. A submarine torpedo having an explosive charge and a containing-shell comprising a cylindrical body formed with annular flanges at either end and hemispherical heads formed with annular flanges welded to the flanges on said body and said shell having corrugations extending around the same, said corrugations comprising semicircular ridges and depressions whereby said shell is strengthened to resist external collapsing pressure.

2. A submarine torpedo having an explosive charge and a containing-shell comprising a body and outwardly-curved heads secured to said body, said body having corrugations extending around the same whereby said shell is strengthened to resist collapsing pressure from adjacent explosions.

810,984. TOOL FOR OPERATING UPON JAR-COVERS. WILLARD C. SMITH, Coldwater, Mich., assignor of one-half to Frank G. Noyes, Coldwater, Mich. Filed Mar. 13, 1905. Serial No. 249,881.

Claim.—A tool for operating upon jar-covers, comprising a single length of spring-wire bent to form the semicircular body 1, and having the terminals thereof extended to form the handles 2 arranged in divergent relation, the portions of the body 1 and the handles 2 adjacent the point of jointure being flattened as indicated at 3, each handle 2 being provided with the jar-cover-rim-engaging member 5 at a point between its ends, said rim-engaging members being located substantially the same distance from the outer extremities of the handles and movable toward and from each other by movement of said handles 2.



810,985. TILTING HAY-FORK. HENRY O. SPARKS, Shelbina, Mo. Filed May 12, 1905. Serial No. 260,167.

Claim.—1. In a tilting hay-fork, a fork having a cross-bar provided with offset terminals forming ears, tines carried by the cross-bar between the ears, and fork-elevating means connected to the ears.

2. In a tilting fork, a fork having a cross-bar, forwardly-projecting tines carried by the cross-bar, the terminals of said cross-bar being offset and forming forwardly-extending ears that are located on opposite sides of the tines, and fork-elevating means including a bail pivoted to the ends of the ears and located over the tines.

3. In a tilting folk, the combination with a handle-shank, of a fork including a cross-bar, a rearwardly-extending stem pivoted to the handle-shank, forwardly-extending tines carried by the cross-bar, forwardly and upwardly extending ears connected to the ends of the cross-bar, and fork-elevating means including a bail having depending terminals pivoted to the ears, said bail extending over the tines.

4. In a tilting fork, the combination with a handle-shank, of a fork pivoted to the shank, a bail pivoted to the fork, a latch for holding the fork against pivotal movement on the handle-shank, and a spring connecting the bail and shank.

5. In a tilting fork, the combination with a fork, of a handle comprising detachable sections, said fork being pivotally connected to one end of one section, a latch mounted on said section for holding the fork against pivotal movement, an actuating device for the latch

extending longitudinally along said section and secured thereto, and another actuating device connected to the other section and detachably connected to the first-mentioned actuating device.

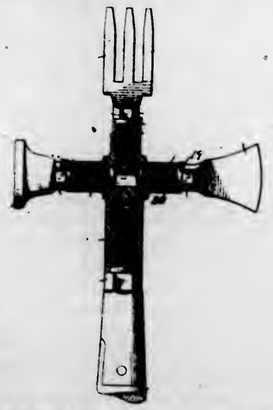
6. In a tilting fork, the combination with a handle comprising detachably-connected sections, of a fork pivotally connected to the free end of one of the sections, a latch pivoted upon said section and engaging the fork to hold it against its pivotal movement, a cord connected to the latch at one end and having its other end attached to the section adjacent to the joint between the sections, said cord having an eye, and another cord secured to the rear end of the adjacent section and having a terminal hook that detachably engages said eye.

810,986. GRATE-BAR. HENRY B. SPERRY, Akron, Ohio, assignor of one-third to John F. Townsend and one-third to Henry Robinson, Akron, Ohio. Filed Nov. 7, 1904. Serial No. 231,780.

Claim.—1. As a new article of manufacture, a grate-bar formed from a composition of cement and silica or quartz pebbles previously expanded by heat, a series of vertically-formed ribs on the sides of said bar of such configuration that when two bars are placed side by side the ribs on adjacent bars will approximately contact, a pair of strengthening-bars inclosed in the body of said grate-bar, one of which is approximately horizontal and the other formed in a downward curve, the ends of said bars being united together and a plurality of cross-wires connecting the two bars together whereby the two bars with the cross-wires will form a unitary strengthening device for the grate-bar.

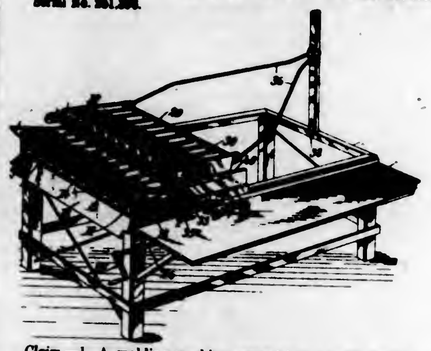
2. As a new article of manufacture, a grate-bar formed from a composition of cement and silica or quartz pebbles, a series of vertically-formed ribs on the sides of said bar of such configuration that when two bars are placed side by side the ribs of adjacent bars will approximately contact, a pair of strengthening-bars inclosed in the body of said grate-bar, one of which is approximately horizontal and the other formed in a downward curve, the ends of said bars being united together and a plurality of cross-wires connecting the two bars together whereby the two bars with the cross-wires will form a unitary strengthening device for the grate-bar.

810,987. COMBINATION-TOOL. JOHN R. SPICER, Lovelady, Tex. Filed Sept. 1, 1905. Serial No. 276,746.



Claim.—A tool including a cruciform head having its arms hollow and internally threaded with their outer ends open and notched, a handle having a threaded shank for engagement with one of the arms of the head and provided with a polygonal wrench-head between the shank and the handle, a set of tools having threaded shanks for engagement with the other arms of the head, each tool having a polygonal wrench-head between the shank and the bit of the tool and provided with a threaded recess between the wrench-head and the threaded portion of the shank, and set-screws carried by the threaded recesses of the shank for engagement with the notches of the tool-head to prevent rotation of the tools.

810,988. MOLDING-MACHINE. HARRY C. STEBLE, WILLIAM STIMSON, and FRED J. TROUT, Jacksonville, Fla. Filed Mar. 22, 1905. Serial No. 251,206.



Claim.—1. A molding-machine comprising a mold having a wall, and means for reciprocating the rest of the mold past said wall, said means comprising a frame connected with the main part of the mold and having a screw-threaded projection, and a rotatable rod having screw-threads for engaging said projection.

2. A molding-machine, comprising a mold having an adjustably-mounted wall, means for holding the wall in fixed position, and means for reciprocating the rest of the mold past said wall; said means comprising a frame connected with the main part of the mold and having a screw-threaded projection, and a rotatable rod having screw-threads for engaging said projection.

3. A molding-machine, comprising a series of adjustably-mounted mold-walls in alinement, means for holding each of said walls in adjusted positions, a series of division-plates, located between said walls and each alternate plate being provided with a slot for the reception of an insert, and means for moving said division-plates.

4. A molding-machine comprising a series of division-plates each alternate one having a slot for the reception of an insert, mold-walls surrounding said division-plates, and means for withdrawing said division-plates simultaneously from said mold-walls.

5. A molding-machine, comprising a series of adjustable mold-walls, a series of division-plates located between each two adjacent mold-walls, a front plate pivoted near the bottom of one edge of said division-plates, means for holding said front plate in vertical position against the ends of the division-plates, and means for moving the division-plates.

6. A molding-machine, comprising a bottom plate, a series of division-plates located thereabove and at an angle thereto and in parallel position with respect to each other, a series of back plates located between the rear ends of said division-plates, and a front plate extending across the front ends of the division-plates and pivotally mounted at its lower side, said front plate being provided with projections, and catches connected with the machine and adapted to engage said projections to hold the front plate against the ends of the division-plates.

7. A molding-machine comprising a mold having an adjustably-mounted wall in sections, each having a projection provided with a slot, means for holding the wall in fixed position comprising a series of screws passing through said slots, means for reciprocating the rest of the mold past said wall, a hopper movably mounted above said mold-wall, means for reciprocating the hopper, and means for adjusting the length of the hopper.

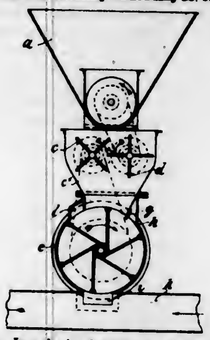
8. A molding-machine, comprising a movable mold having an adjustable wall, means for holding said wall in fixed position, a hopper mounted above said mold, said hopper having ways for guiding it in a straight line with respect to the mold, and means for moving the hopper comprising a lever pivotally connected with the machine and a frame connecting the lever and hopper.

9. A molding-machine, comprising a series of mold-walls in alinement, and a series of division-plates located between said walls, each alternate plate being provided with a slot for the reception of an insert.

10. A molding-machine, comprising a series of mold-walls in alinement, a series of division-plates located between said walls, each alternate plate being provided with a slot for the reception of an insert, and means for moving said division-plates longitudinally.

11. A molding-machine, comprising a series of division-plates, certain of said plates having slots for the reception of inserts, mold-walls located adjacent to said division-plates, and means for withdrawing the plates from the walls.

810,989. DEVICE FOR TRANSPORTING GREEN MALT. CARL STEINERT, Munich, Germany. Filed May 26, 1904. Serial No. 209,693.

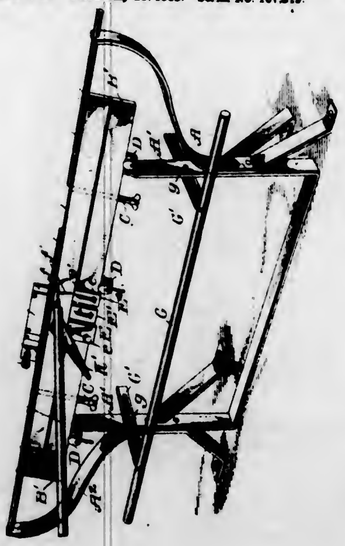


Claim.—1. In a device for transporting green malt, the combination, with a pneumatic-tube system, of a hopper to receive the malt, a screw conveyer leading therefrom, intermeshing disintegrating-arms at the discharge from the conveyer, and a feed-drum provided with buckets arranged between the disintegrator and pneumatic tube.

2. In a device for transporting green malt, the combination, with a pneumatic-tube system, of a feed-hopper, a screw conveyer leading therefrom, intermeshing disintegrating-arms at the discharge from the conveyer, a feed-drum provided with buckets arranged between the disintegrator and pneumatic tube, and a casing tightly fitting around the drum, there being air-vents from the casing.

3. In a device for transporting green malt, the combination, with a pneumatic-tube system, of a feed-hopper, a screw conveyer leading therefrom, intermeshing disintegrating-arms at the discharge from the conveyer, a feed-drum provided with buckets arranged between the disintegrator and pneumatic tube, a casing tightly fitting around the drum, there being air-vents from the casing, and a yielding scraper arranged to contact with the bucket edges.

810,990. APPARATUS FOR ENGRAVING. JOSIAH P. STEVENS, Atlanta, Ga. Filed July 28, 1903. Serial No. 167,219.



Claim.—1. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame, a shading device traveling along said type-holder and provided with a guide-arm projecting in front of the type, a tracer-rod and a tracer-tool carried thereby, an elbow-bar adjustably connected to said frame to facilitate the guidance of the tracer-rod, and a hand-rest mounted near the type-holder to facilitate the operation of the shading device, substantially as described.

2. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame, a shading device mounted on said type-holder and provided with a guide-arm projecting in front of the type, means for imparting a step-by-step motion to said shading device, a tracer-rod and a tracer-tool carried thereby, an elbow-bar adjustably connected to said frame to facilitate the guidance of the tracer-rod, and a hand-rest mounted near the type-holder to facilitate the operation of the shading device, substantially as described.

3. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame and comprising two boards, with means for clamping the edge of the one against the edge of the other, a shading device traveling along said type-holder and provided with a guide-arm projecting in front of the type, a tracer-rod and a tracer-tool carried thereby, an elbow-bar adjustably connected to said frame to facilitate the guidance of the tracer-rod, and a hand-rest mounted near the type-holder to facilitate the operation of the shading device, substantially as described.

4. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame and comprising two boards, with means for clamping the edge of the one against the edge of the other, a shading device traveling along said type-holder and provided with a guide-arm projecting in front of the type, means for imparting a step-by-step motion to said shading device, a tracer-rod and a tracer-tool carried thereby, an elbow-bar adjustably connected to said frame to facilitate the guidance of the tracer-rod, and a hand-rest mounted near the type-holder to facilitate the operation of the shading device, substantially as described.

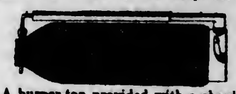
5. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame, and a shading device traveling along said type-holder and provided with a guide-arm projecting in front of the type, of an elbow-bar adjustably connected to said frame, and a wrist-bar mounted above and in front of the type-holder, substantially as described.

6. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame, a shading device mounted on said type-holder and provided with a guide-arm projecting in front of the type, and means for imparting a step-by-step motion to said shading device, an elbow-bar adjustably connected to said frame, and a wrist-bar mounted above and in front of the type-holder, substantially as described.

7. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame and comprising two boards, and means for clamping the edge of the one against the edge of the other, of a shading device traveling along said type-holder and provided with a guide-arm projecting in front of the type, an elbow-bar adjustably connected to said frame, and a wrist-bar mounted above and in front of the type-holder, substantially as described.

8. In an apparatus for engraving, the combination with a frame, a type-holder mounted on said frame and comprising two boards, with means for clamping the edge of the one against the edge of the other, a shading device traveling along said type-holder, and provided with a guide-arm projecting in front of the type, and means for imparting a step-by-step motion to said shading device, of an elbow-bar adjustably connected to said frame, and a wrist-bar mounted above and in front of the type-holder, substantially as described.

810,991. MANTLE-SUPPORT. TOWNSEND SYSTEM, Gloucester City, N. J., assignor to Welsbach Light Company, Gloucester City, N. J., a Corporation of New Jersey. Filed Sept. 23, 1904. Serial No. 226,508.

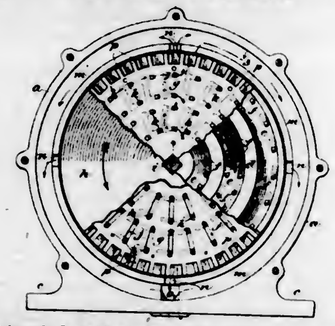


Claim.—1. A burner-top provided with a shoulder, a mantle-supporting wire rising from the shoulder, and a refractory tube seated on the shoulder and sheathing the wire and of larger internal diameter than the external diameter of the wire so as to afford an air-space, substantially as described.

2. A burner-top provided with an upwardly-extending tubular socket, a refractory tube seated on the top rim of the tubular socket, and a mantle-supporting wire rising from the interior of the socket and penetrating the tube whereby the shank of the wire is protected and reinforced throughout its length, substantially as described.

3. A burner top or cap provided with means for holding a mantle-supporting wire, a mantle-supporting wire and a refractory tube sheathing the wire and which is of larger internal diameter than the external diameter of the wire so as to afford an air-passage, substantially as described.

810,992. ELASTIC-FLUID TURBINE. OLE O. STORLE, Burlington, Wis. Filed Aug. 15, 1904. Serial No. 220,696.



Claim.—1. In an elastic-fluid turbine the combination of a casing provided with nozzles arranged in a number of separate series and a runner having passages each adapted and arranged to receive the fluid from one series of nozzles and to discharge it back into another series in a direction to react upon the runner and coöperate with the direct impact of the fluid entering said passages in driving the runner forward, substantially as described.

2. In an elastic-fluid turbine the combination of a nozzle disk or body having chambers and oblique nozzle-passages communicating with said chambers, and a runner having passages opening through the same face thereof and arranged to register at their ends with said nozzle-passages, each runner-passage being arranged to receive motive fluid from one of said chambers and to discharge it in a reverse direction into the other and serving as a vane or abutment to receive the direct impact of the fluid as it enters and the reaction of said fluid as it escapes from the runner, substantially as described.

3. In an elastic-fluid turbine the combination of a nozzle disk or body having a series of chambers and oblique nozzle-passages communicating with said chambers, the number of said passages increasing from the supply toward the exhaust connection of the turbine, and a runner having corresponding series of passages opening obliquely at the ends through the same face in position to register with the nozzle-passages, each runner-passage being arranged to register at the ends with nozzle-passages communicating with different chambers, substantially as described.

4. In an elastic-fluid turbine the combination of a casing provided with nozzle-chambers and nozzle-passages communicating with said chambers and arranged in circular series, and a runner having corresponding series of passages opening at both ends through the same face thereof and arranged to register with said nozzle-passages, each runner-passage being arranged to receive motive fluid from one nozzle-chamber and to discharge it into another, and the number of passages increasing in successive series, substantially as described.

5. In an elastic-fluid turbine the combination of a casing having fluid-supply and exhaust connections, a series of nozzle-chambers and passages communicating therewith and increasing in number and total area from the supply toward the exhaust connection, and a runner having corresponding series of passages each adapted and arranged to receive motive fluid from one series of nozzle-passages and to discharge it in a reverse direction into another series which communicate with and supply the motive fluid to the next series, substantially as described.

6. In an elastic-fluid turbine the combination of a casing, nozzle-disks having channels in their outer faces next to the inner walls of the casing and nozzle-passages extending from said channels to the inner faces of said disks, a runner composed of two parts separated by a partition transversely to the axis of the turbine and each having passages opening at both ends through its outer face in position to register with passages communicating with the channels in said disks, each runner-passage registering at its opposite ends with passages which communicate with different channels, substantially as described.

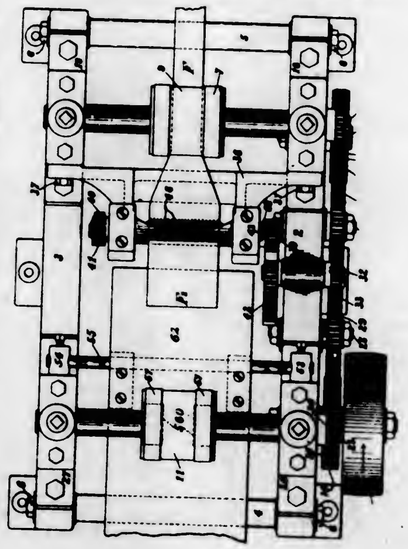
7. In an elastic-fluid turbine the combination of a casing composed of sections joined together in a plane transverse to the axis of the turbine, nozzle-disks fitted in said casing and having channels in their outer faces next to the inner walls of the casing and passages extending from said channels obliquely inward to the inner faces of the disks, a runner composed of twd parts separated by a partition transversely to the axis of the turbine and fitted to turn between said disks, each part of the runner having radial passages opening obliquely through their outer faces in position to register with the passages in the nozzle-disks, and each runner-passage registering at its ends with passages which communicate with different channels in the adjacent nozzle-disk, substantially as described.

8. In an elastic-fluid turbine the combination of a casing having fluid supply and exhaust connections and provided with nozzle-passages arranged in circular series, and a runner having corresponding series of passages each adapted to receive motive fluid from one series of nozzle-passages and to discharge it in a reverse direction into another series, said runner also having a circular series of vanes or abutments arranged to receive motive fluid from the last series of nozzle-passages, substantially as described.

9. In an elastic-fluid turbine the combination of a casing having two fluid-supply connections at opposite ends, and an exhaust-passage communicating with the outer part of the runner-chamber, said casing being provided at both ends with nozzle chambers and passages communicating therewith and arranged in circular series, the inner channels or chambers communicating with the fluid-supply connections, and a runner having passages arranged in circular series on both sides thereof and each opening at both ends through the same face and being adapted and arranged to receive motive fluid from one nozzle channel or chamber and to discharge it into another, substantially as described.

10. In an elastic-fluid turbine the combination of a casing provided in the ends with nozzle chambers and passages arranged in circular series and a runner composed of two plates secured together with a partition-plate between them and each formed in its inner face with radial channels which are connected at the ends with its outer face by transverse passages, said passages being arranged in circular series to register at the ends with the nozzle-passages, substantially as described.

810,993. CUTTING MECHANISM. FREDERICK H. STRAEURG, Rumford Falls, Me., assignor to Continental Paper Bag Company, a Corporation of Maine. Filed May 4, 1905. Serial No. 258,830.



Claim.—1. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in the face thereof, an intermittently-rotatable knife contiguous to the float, said knife having a plurality of teeth for engagement with the grooves respectively, in the float, all combined and working together substantially as described.

2. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in the face thereof, an intermittently-rotatable knife contiguous to the float, said knife having a plurality of teeth for engagement with the grooves respectively in the float, means to feed a web between the float and knife, means to intermittently rotate the knife at a linear speed greater than the feed of the web all combined and operating together substantially as described.

3. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in each side thereof, said grooves being sufficient in number to extend substantially the width of each side of said float, a rotatable knife above the float, said knife having a plurality of teeth for engagement with each of the grooves respectively in the upper face of the float, a rotatable knife below the float, said knife having a plurality of teeth for engagement with each of the grooves respectively in the under face of the float, means to feed a web around the float and between the float and the knives and means to rotate the knives intermittently and at a linear speed greater than the feed of the web.

4. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in each face thereof, said grooves being sufficient in number to extend substantially the width of each face of the float, said grooves in the upper face of the float being longitudinally substantially opposite the grooves in the lower face of the float and spaced laterally intermediate thereof respectively and none of said grooves perforating said float; a rotatable knife above the float, said knife having teeth for engagement with each groove respectively in the upper face of the float and a rotatable knife below the float, said knife having teeth for engagement with each groove respectively in the lower face of the float, all combined and operating together substantially as described.

5. The combination of a float having a plurality of grooves lengthwise in each face thereof, said grooves in the upper face of the float being longitudinally substantially opposite the grooves in the lower face of the float and spaced laterally intermediate thereof respectively; a rotatable knife above the float, said knife having a plurality of teeth for engagement with the grooves respectively in the upper face of the float, and a rotatable knife below the float, said knife having a plurality of teeth for engagement with the grooves respectively in the lower face of the float; and means to intermittently rotate the knives, all combined and operating together substantially as described.

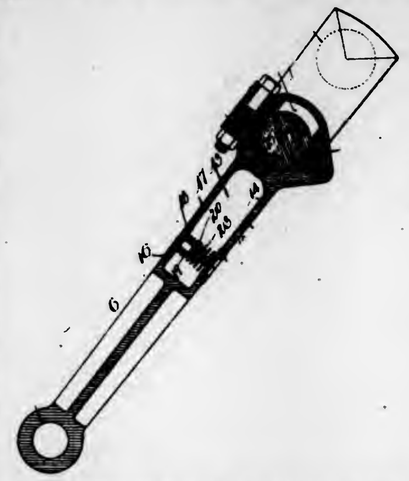
6. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in the face thereof, a rotatable knife above the float, said knife having a plurality of teeth for engagement with the grooves respectively, in the float, means to feed a web over the float and under the rotatable knife, means to normally hold the knife out of engagement with the float, means to intermittently rotate the knife at a linear speed in excess of the feed of the web, all combined and operating together substantially as described.

7. The combination of a float having a plurality of laterally-contiguous grooves lengthwise in the face thereof, a rotatable knife above the float, said knife having a plurality of teeth for engagement with the grooves respectively in the float, means to normally hold the knife out of engagement with the float and means to intermittently rotate the knife, all combined and operating together substantially as described.

8. The combination of a float having a plurality of grooves lengthwise in each face thereof, said grooves in the upper face of the float being longitudinally substantially opposite the grooves in the lower face of the float and spaced laterally intermediate thereof respectively and none of said grooves perforating said float; a rotatable knife above the float and a rotatable knife below the float, each knife having teeth for engagement with the grooves respectively in the float, all combined and operating together, substantially as described.

810,994. CONNECTING-ROD FOR ENGINES. JOHN STUART, Wellesley, Mass. Filed Sept. 23, 1905. Serial No. 279,790.

Claim.—1. A connecting-rod for engines provided with a chamber extending longitudinally thereof and with an outlet-passage leading out of one end thereof into a bearing formed upon said connecting-rod, together with a supply-passage extending through one of the side walls of said chamber, a valve located in said supply-passage, a screw-plug in one wall of said chamber in the opposite side thereof from that in which said valve is located, said plug being in alinement with said valve, there being a shank on said plug projecting into said chamber, and a spring in said chamber one end bearing against said valve the other end encircling said shank and bearing against said plug.

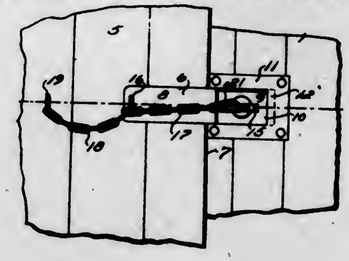


2. A connecting-rod for engines provided with a chamber extending longitudinally thereof and with an outlet-passage leading out of one end thereof into a bearing formed upon said connecting-rod, together with a supply-passage extending through one of the walls of said chamber, a valve located in said supply-passage, a screw-plug in one wall of said chamber in the opposite side thereof from that in which said valve is located, said plug being in alinement with said valve, there being a shank on said plug projecting into said chamber, and a spring in said chamber one end bearing against said valve the other end encircling said shank and bearing against said plug.

3. A connecting-rod for engines having a bearing formed in each of its opposite ends, a portion of said rod adjacent to one of said bearings rectangular in cross-section and provided with a chamber extending longitudinally thereof, one end of said chamber connected to said bearing by an outlet-passage, a check-valve in said outlet-passage, the other end of said chamber provided with a supply-passage extending through one of the walls of said chamber, a valve located in said supply-passage, a screw-plug in one wall of said chamber on the opposite side thereof from that in which said valve is located, said screw-plug being in alinement with said valve, there being a shank on said plug projecting into said chamber, and a spring in said chamber, one end of said spring bearing against said valve, the other end encircling said shank and bearing against said plug.

4. A connecting-rod for engines provided with a chamber extending longitudinally thereof and with an outlet-passage leading out of one end thereof into a bearing formed upon said connecting-rod, together with a supply-passage extending through one of the walls of said chamber, means to close said supply-passage, a cap fast to said connecting-rod in which a portion of said bearing is formed, and a pocket adapted to contain lubricating material located in said cap and opening inwardly therefrom into said bearing.

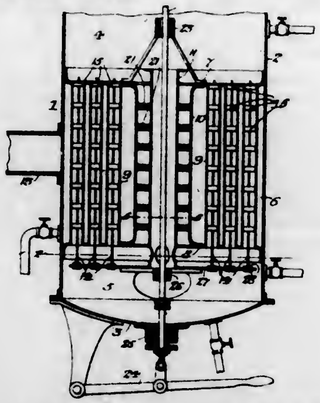
810,995. CAR-DOOR CLEAT AND SEALING DEVICE. STEPHEN C. SULLIVAN, Chicago, Ill. Filed Dec. 19, 1904. Serial No. 237,496.



Claim.—1. The combination of a frame, a door slidably mounted on one face of said frame, a member set in flush with said face and having therein a socket, a cleat having a part fitting within said socket, said cleat being adapted when in engagement with said socket, to extend across the edge of the door in its closed position and prevent the opening thereof, a pin secured to said part, having threaded engagement with said member and adapted to secure said part within said socket, and means for sealing said pin to prevent its removal from said socket, substantially as described.

2. The combination of a frame, a door slidably mounted on one face of said frame, a member set in flush with said face and having therein a socket, a cleat having a part fitting within said socket, said cleat being adapted when in engagement with said socket, to extend across the edge of the door in its closed position and prevent the opening thereof, a pin having threaded engagement with said member and adapted to bear on said part for securing the same within said socket, a chain having swiveled connection with said pin and being secured to said door, and said pin having a head having therein an eye for receiving a wire seal for connecting the pin to a link of the chain and preventing the unscrewing of the pin, substantially as described.

810,996. FLUE-SCRAPER FOR EVAPORATORS, BOILERS, AND THE LIKE. TŌRABURO SUZUKI, Sumamura, Japan. Filed June 12, 1905. Serial No. 264,826.



Claim.—1. A scraper for evaporators, boilers and the like provided with a plurality of flues, a rod for each of the flues extending throughout the length thereof, a plurality of scrapers for each rod spaced apart in a manner to scrape the flue throughout its length by a limited reciprocation, and a main actuating-rod extending through the wall of the evaporator and connected with each of said rods whereby the same may be reciprocated in unison.

2. A scraper for evaporators, boilers and the like provided with a plurality of flues, a rod for each of the flues, a plurality of scrapers for each rod, each scraper comprising an annular ring provided with sharp margins, a hub keyed to the rod and spokes connecting the hub and ring, and a main actuating-rod extending through the wall of the evaporator and connected with each of said rods whereby the same may be reciprocated in unison.

3. A scraper for evaporators, boilers and the like provided with a plurality of flues, a rod for each of the flues extending throughout the length thereof, a plurality of scrapers for each rod spaced apart in a manner to scrape the flues throughout their length by a limited reciprocation, each scraper comprising an annular ring provided with sharp margins, a hub keyed to the rod, spokes connecting the hub and ring, and a main actuating-rod extending through the wall of the evaporator and connected with each of the rods whereby the same may be reciprocated in unison.

4. A scraper for evaporators, boilers, and the like provided with a plurality of curved flues, a flexible rod for each of the flues extending throughout the length thereof, a plurality of scrapers for each rod spaced apart in a manner to scrape the flue throughout its length by a limited reciprocation, a main actuating-rod extending through the wall of the evaporator and jointedly connected with each of said rods whereby the same may be reciprocated in unison.

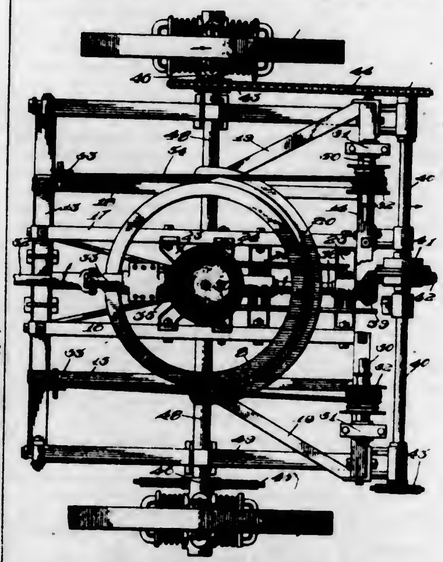
5. A scraper for evaporators, boilers and the like provided with a plurality of curved flues, a flexible rod for each of the flues, a plurality of scrapers for each rod each scraper comprising an annular ring provided with sharp margins, a hub keyed to the rod, spokes connecting the hub and ring, and a main actuating-rod extending through the wall of the evaporator and jointedly connected with each of said rods whereby the same may be reciprocated in unison.

6. A scraper for evaporators, boilers and the like provided with a plurality of curved flues, a flexible rod for each of the flues extending throughout the length thereof, a plurality of scrapers for each rod spaced apart in a manner to scrape the flue throughout its length by a limited reciprocation, each scraper comprising an annular ring provided with sharp margins, a hub keyed to the rod, spokes connecting the hub and ring, and a main actuating-rod extending through the wall of the evaporator and jointedly connected with each of the rods whereby the same may be reciprocated in unison.

7. A scraper for evaporators, boilers and the like comprising a rod and a plurality of scrapers equally spaced apart along and being in close contact with the flue whereby movement of said rod equal to the spacing between any two scrapers serves to bring the scrapers in contact with the flue throughout its length.

8. A scraper for evaporators, boilers and the like comprising a rod, and a plurality of scrapers having oppositely-disposed cutting edges, said scrapers being equally spaced apart along and being in close contact with the flue whereby movement of said rod in opposite directions a distance equal to the spacing of any two scrapers serves to bring said scrapers in contact with the flue throughout its length.

810,997. SELF-PROPELLED VEHICLE-TRUCK. HORACE H. TAYLOR, San Jose, Cal. Filed Feb. 6, 1905. Serial No. 244,449.



Claim.—1. In a truck for self-propelled vehicles, the combination with a circle, a truck-frame secured to one member of said circle, wheels carried by said truck-frame, and means for turning said truck on said circle, of gearing carried by said truck-frame concentric with said circle, means for driving said gearing, a divided shaft journaled in said frame, differential gearing connecting the members of said shaft, an intermediate shaft journaled in said frame and geared respectively with the gearing on said circle and with said divided shaft, substantially as described.

2. In a truck for self-propelled vehicles, the combination with a circle, a truck-frame secured to one member of said circle, wheels carried by said trick-frame and means for turning said truck on said circle, of gearing carried by said truck-frame concentric with said circle, means for driving said gearing, a divided shaft journaled on said frame, differential gearing connecting the members of said shaft, a gear on said shaft, an intermediate shaft journaled on said frame, gears on said intermediate shaft meshing respectively with said first-named gearing and with the last-named gear on said divided shaft, and connections between said shaft and said wheels.

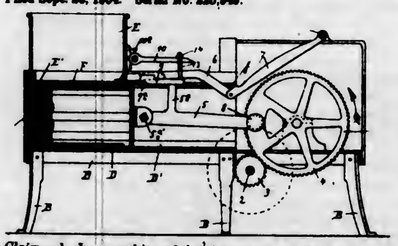
3. In a front truck for self-propelled vehicles, the combination with a circle, a truck-frame secured to one member of said circle, wheels carried by said truck-frame and means for turning said truck on said circle, of gearing carried by said truck-frame concentric with said circle, means for driving said gearing, a divided shaft journaled in said frame, differential gearing connecting the members of said shaft, an intermediate shaft journaled on said frame, gears on said intermediate shaft and meshing, respectively, with the first-named gearing and with gearing on said differential gearing, and connections between said shaft and said wheels.

4. In a front truck for self-propelled vehicles, the combination with a vehicle-body, a truck-frame, a circle composed of two members one secured to said vehicle-body and the other to said truck-frame, and means for turning said truck on said circle, of a sleeve rotatably carried on said truck-frame concentric with said circle, bevel-gears on said sleeve at each end thereof, a shaft journaled in said truck-frame and adapted to be connected with a prime mover carried by said vehicle and provided with a gear meshing with one gear on said sleeve, a divided shaft carried by said truck-frame and provided with differential gearing, an intermediate shaft journaled in said truck-frame and provided with bevel-gears at each end adapted to mesh, respectively, with the other bevel-gear on said sleeve and with the differential gearing on said shaft, an axle carried by said truck-frame, wheels on said axle, and connections between said shaft and said wheels.

5. In a front truck for self-propelled vehicles, the combination with a vehicle-body, a truck-frame, a circle composed of two members secured, respectively, to said vehicle-body and said truck-frame, gearing carried by said truck-frame concentric with said circle, means for driving said gearing, wheels carried by said truck-frame, and gearing connections between said first-named gearing and said wheels, of a grooved segment secured to said truck-frame concentric with said circle, a shaft journaled on said truck-frame, drums journaled on said shaft, and a rope engaging said segment and adapted to be wound and unwound upon said drums, respectively, when the same are rotated.

6. In the front truck for self-propelling vehicles, the combination with a vehicle-body, a truck-frame, wheels carried by said truck-frame, a circle composed of two members secured respectively to said vehicle-body and said truck-frame, a pin mounted in said vehicle-body concentric with said circle, a bevel-gear revolubly mounted on said pin and provided with a hub, and means for driving said gear, of a gear secured to said hub, a divided shaft carried by said truck-frame, differential gearing connecting the members of said divided shaft, an intermediate shaft, gearing on said intermediate shaft connecting the same with the gear on said hub and with said divided hub, and connections between said divided shaft and said wheels, substantially as described.

810,998. CUTTING-MACHINE FOR VEGETABLES, &c. ALBION W. THOMAS, Rome, N. Y., assignor to Leon V. Jones, Rome, N. Y. Filed Sept. 26, 1904. Serial No. 225,949.



Claim.—1. In a machine of the character described, the combination with fixed knives, a plunger adapted to feed thereto, and mechanism for operating the plunger, of a blade mounted to reciprocate in a plane parallel with the plunger and separate therefrom, means to advance the blade ahead of the plunger to cut off the feed of material to the plunger, means for connecting the blade and the plunger during the back stroke and means for suspending the operation of said connecting means whereby the blade may remain in position to cut off feed to the plunger, substantially as shown.

3. In a device of the character described, the combination of a plunger-box with a feed-opening thereto and a plunger operating therein, knives at the end of said plunger-box, a sliding knife traversing the feed-opening to the plunger-box, mechanism for operating the plunger, independent means actuated by said mechanism to thrust the blade forward, and means normally connecting the blade to the plunger during the back stroke together with means for disconnecting the blade from the several means which operate it to and fro, substantially as shown.

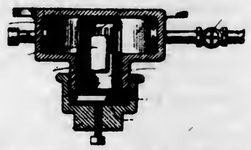
4. In a device of the character described, the combination of a frame, a box, a hopper, a plunger, and a knife operating between the box and the hopper to intercept material being fed to the said box, common means for reciprocating said blade and plunger through separate members actuated thereby, such members, and means for suspending the retracting operation of the member connected with the blade.

5. In a device of the character described, the combination of a plunger-box, knives arranged transversely of the plunger-box, a plunger, a feed-hopper, a sliding blade, mechanism to reciprocate the plunger, means operatively connected with said mechanism to withdraw the blade, and means operative at will to prevent the back stroke of the blade with the plunger, substantially as shown.

6. In a device of the character described, comprising a plunger-box, a plunger reciprocating therein, means for reciprocating the plunger, a feed-hopper and a blade slidable in a plane parallel with the plunger, link members connected to the said blade so placed as to be actuated by the plunger-operating mechanism to thrust the blade forward across the feed-opening, a latch operative by gravity to connect the blade with the plunger on the back stroke of the latter, and means for engaging the said latch to prevent the back stroke of the blade with the plunger.

7. In a device of the character described having a plunger, a plunger-box, a feed-hopper and a blade, means operative to reciprocate the plunger, means operative to give the blade a forward stroke by contact of the said means with the plunger-actuating parts, means automatically operative to connect the blade to the plunger on the back stroke, and means for suspending the operating of said latter means.

810,999. HYDRAULIC LUBRICATOR. RICHARD THOMPSON, New York, N. Y., and JOHN A. SHARMAN, East Orange, N. J. Filed Apr. 6, 1903. Serial No. 151,228.



Claim.—1. In a lubricator, a closed vessel having a connection for bringing in a current of water, a connection for leading away the same, and a lateral aperture with a neck A^5 in the upper portion, in combination with a removable perforated casing adapted to be supported in such aperture and to be inserted and removed through the same, a removable cap and means carried by the cap adapted to bear strongly against the casing and to tightly seal the aperture in the vessel.

2. In a lubricator, a closed vessel A having a lateral connection I for bringing in a current of water, a top connection J for leading away the same and an aperture in the upper portion of the front with a projecting neck A^4 screw-threaded on its exterior, in combination with a removable perforated casing G extending from such aperture across the interior and a removable cap B screw-threaded for strongly attaching to said neck and having provisions for making a tight joint, the cap serving as a means for holding and closing such casing and liberating it when required, and also means for tightly closing the vessel, all substantially as herein specified.

3. In a lubricator a closed vessel A having a lateral connection I for bringing in a current of water, a top connection J for leading away the same and an aperture in the upper portion of the front, in combination with a removable perforated casing G extending from

such aperture across the interior, and with a gasket B of yielding material covering said aperture, a stout metal disk D over the same carrying a cap B and screw C arranged to exert pressure on the metal disk and subject the soft material to simple compression without abrasion between such disk and the edges of the aperture, all substantially as herein specified.

811,000. GASKET. VREELAND TOMPKINS, Jersey City, N. J. Filed Mar. 29, 1905. Serial No. 252,603.

Claim.—An article of the class described comprising a corrugated gasket having a flexible projection formed therewith adapted to extend beyond the heads of the joint to be sealed by said gasket to afford means for holding the gasket stationary during the formation of the joint.

811,001. CLEANING DEVICE. ADDISON P. TRIEM, Buffalo, N. Y. Filed Dec. 15, 1904. Serial No. 237,027.

Claim.—1. The combination with the wall of a housing having guide-slots therein, of a cross-head lying across the window of said wall, a cleaning device secured to said cross-head and lying in contact with the window, and handles at the ends of said cross-head and extending through said slots within reach of the operator within the housing.

2. In a device of the character described, the combination with the wall having guide-slots therein, of a cross-head normally held elevated and having handles extending through said slots to permit the device to be operated from within the housing, a cleaning device carried by said cross-head, and means for closing said slots when the device is in its normal position.

3. In a device of the character described, the combination with the wall having guide-slots therein, of a cross-head normally held elevated and having handles extending through said slots to permit the device to be operated from within the housing, a cleaning device carried by said cross-head, and flexible strips attached to said cross-head and to the wall beneath the guide-slots.

4. The combination with the wall of a housing having guide-slots therein, of a cross-head having cleaning devices comprising a cleaning-strip, and handles extending from the cross-head through said guide-slots to render the device operative from within the housing.

5. In a device of the character described, the combination of a window-frame having guide-slots therein, a cross-head extending across the front of the window, handles secured to said cross-head and having a flattened portion extending into the housing through said guide-slots, and a cleaning-strip projecting from the inner portion of the cross-head and lying in contact with the window.

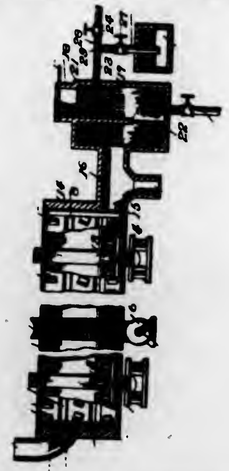
6. In a device of the character described, the combination of a window-frame having guide-slots therein, a cross-head extending across the front of the window, a cleaning device on said cross-head, handles secured to said cross-head and having a flattened portion extending into the housing through said guide-slots, and a cross-head carried on the handles within the housing and having a cleaning-strip in contact with the window.

7. In a device of the character described, the combination of a window-frame having guide-slots therein, a cross-head extending across the front of the window, handles secured to said cross-head and having a flattened portion extending into the housing through said guide-slots, a flexible strip projecting from the inner portion of the cross-head and lying in contact with the window, and a cross-head adjustable on the handles within the housing and provided with a cleaning-strip adapted to clean the inner side of the window.

8. In a device of the character described, the combination of a window-frame having guide-slots therein, a cross-head extending across the front of the window, handles secured to said cross-head and having a flattened portion extending into the housing through said guide-slots, a metallic strip projecting from the upper portion of the cross-head and normally out of contact with the window, and a cross-head adjustable on the handles within the housing and provided with a flexible strip adapted to clean the inner side of the window.

9. In a device of the character described, the combination of a window-frame having guide-slots therein, a cross-head lying across the front of the window and having a transverse opening at each end, each opening being enlarged and rectangular at the inner end thereof, a cleaning-strip attached to said cross-head, handles rectangular in cross-section and having reduced threaded ends, said reduced ends and the adjacent rectangular portion of each handle fitting said opening, and nuts secured to the projecting ends of said handles with the extremities of the reduced ends projecting from the cross-head.

811,002. APPARATUS FOR PRODUCING EFFLORESCENCE. KANEO TSUJI, Takaoka, Japan. Filed Jan. 11, 1905. Serial No. 240,663.



Claim.—1. In a machine for adding moisture to materials, the combination with a rotating drum, of means for feeding material to be moistened into one end of the drum, means for causing the material to be picked up and dropped in the drum, means for causing the material to progress through the drum, and means for introducing moisture in the form of a vapor into the delivery end of the drum.

2. In a machine for adding moisture to materials, the combination with a rotating drum, of means for feeding material to be moistened into one end of the drum, means for causing the material to be picked up and dropped in the drum, means for causing the material to progress through the drum, means for introducing moisture in the form of a vapor into the delivery end of the drum and means for regulating the amount of moisture introduced.

3. In a machine for adding moisture to materials, the combination with a rotating drum, of means for feeding material to be moistened into one end of the drum, means for causing the material to be picked up and dropped in the drum, means for causing the material to progress through the drum, means for introducing moisture into the drum, and means for withdrawing the air from the drum.

4. In a machine for adding moisture to materials, the combination with a rotating drum, of means for feeding material to be moistened into one end of the drum, means for causing the material to be picked up and dropped in the drum, means for causing the material to progress through the drum, means for introducing moisture into the drum, means for withdrawing the air from the drum and separating the dust from the air.

5. In a machine for adding moisture to materials, the combination with a rotating drum, of means for feeding material to be moistened into one end of the drum, means for causing the material to be picked up and dropped in the drum, means for causing the material to progress through the drum, means for introducing moisture into the drum and means for withdrawing the air from the drum and separating the dust from the air.

6. A rotating cylinder provided on its interior with a series of plates arranged at an angle to the axis of rotation of the cylinder, said plates forming by their faces an interrupted screw whereby when the cylinder is rotated, the plates will act to feed material through the cylinder and a series of longitudinal shelves adapted to pick up and drop the material in the cylinder as it rotates.

7. In a machine for adding moisture to materials, the combination with an agitating device into which the material to be moistened is fed and means for supplying moisture-laden air to the agitating device, of a casing connected to the agitating device and provided with an exhausting means whereby the air will be withdrawn from the agitating device, of a filtering device located between the exhausting device and the agitating device through which the air is drawn and by which it is deprived of dust carried in suspension.

8. In a machine for adding moisture to materials, the combination with an agitating device, of means for supplying moisture-laden air to one end of the device and means for withdrawing the air from the other end of the device, of a filter through which the air passes, said filter consisting of a plurality of frames wedge-shaped in cross-section and covered with filtering material, said frames being arranged in the form of a cylinder as and for the purpose described.

9. In a machine for adding moisture to materials, the combination with an agitating device, of means for supplying moisture-laden air to the agitating device, said supplying device consisting of a casing, an opening in the casing through which air may pass a steam-jet entering the casing to supply moisture to the air and a water-supply connected to the steam-jet, whereby water may be mixed with the steam before the same enters the casing.

10. In a machine for adding moisture to materials, the combination with an agitating device, of means for supplying moisture-laden air to the agitating device, said supplying device consisting of a casing, an opening in the casing through which air may pass and a steam-jet entering the casing to supply moisture to the air, and means for adding water to the steam before it enters the casing.

11. In a machine for adding moisture to materials, the combination with an agitating device, of means for supplying moisture-laden air to the agitating device, said supplying device consisting of a casing, an opening in the casing through which air may pass, a steam-jet entering the casing to supply moisture to the air and a partition extending part way across the casing against which the steam impinges.

12. In a machine for adding moisture to materials, the combination with an agitating device, of means for supplying moisture-laden air to the agitating device, said supplying device consisting of a casing, an opening in the casing through which the air may pass, a steam-jet entering the casing to supply moisture to the air, a partition extending part way across the casing against which the steam impinges and a reticulated fabric extending from the end of the partition to the side of the casing.

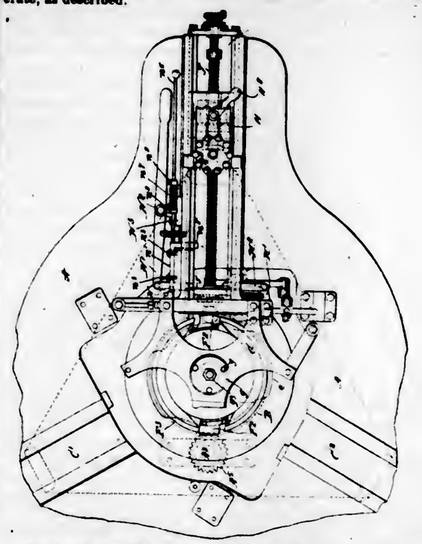
811,003. TIE-PLATE FOR FURNACES. CHARLES B. TUDOR, Cincinnati, Ohio, assignor to The Tudor Boiler Manufacturing Company, Cincinnati, Ohio, a Corporation. Filed Nov. 13, 1905. Serial No. 287,163.

Claim.—A furnace tie-plate formed integral from a metal blank, having an arch-brace struck up in the central portion thereof, terminating at the sides and ends in plane marginal faces, substantially as described.

811,004. MACHINE FOR CUTTING WOODEN DISHES. JAMES B. TUTTLE, Watertown, and JAMES MACLEAN, Boston, Mass., assignors to Levi L. Rowe, Boston, Mass. Filed Aug. 21, 1903. Serial No. 170,276.

Claim.—1. In a dish-cutting machine, a rotary cutter, a trimming-knife, and means whereby each is operated, a carrier and means whereby it is given an intermittent progressive feed toward the cutter-head, and means whereby between each feed movement it is given a reciprocating movement rearward to register with said trimming-knife, and forward after the operation of said trimming-knife, as set forth.

2. In a dish-cutting machine, in combination with a block-feed and a trimming-knife adapted to shave off the front of the block, means for cutting a dish from said block comprising a rotary cutter-head, a support therefor having a cam-surface whereby said block-feed is moved from a place in register with said rotary cutter to a place in register with said trimming-knife, and a cam-surface, and means operated thereby whereby said trimming-knife is caused to operate, as described.



3. In a dish-cutting machine, in combination, a rotary cutter-head, a support therefor located beneath said cutter-head, and means located above said cutter-head for centering it, and means for supporting said cutter-head support comprising a stationary table having bearings thereon adapted to engage with a prepared surface on said cutter-head support, said table also carrying a suitable gear whereby power may be applied thereto to rotate said cutter-head, as set forth.

4. In a dish-cutting machine, a cutter-support comprising two opposing surfaces, a cylindrical cutter-head connecting said surfaces, a bow-shaped knife also connecting said surfaces and provided with a bracing-strap mounted on said cutter-head, the front end of said bracing-strap engaging the rear edge of said knife, as described.

5. In a dish-cutting machine, a rotary cutter and a feed mechanism comprising a carrier having a nut forming a part thereof, a screw the thread of which is adapted to lie within said nut, said screw being supported to move endwise with said carrier, and means mounted upon said cutting-head, whereby an endwise movement is given to said screw to move said carrier toward and from a position where the block carried by it will be engaged by the cutter, as set forth.

6. In a dish-cutting machine, a rotary head carrying one or more knives, a reciprocating carrier, means for reciprocating said carrier comprising a cam rigidly mounted on said cutter-head, and located to engage said carrier, as shown.

7. In a dish-cutting machine, a rotary cutter-head carrying one or more knives, a reciprocating carrier, means whereby said carrier is fed comprising a feed-screw having means for turning it, said feed-screw being supported at each end, and means located on said cutter-head and adapted to engage the adjacent end of said feed-screw to reciprocate said carrier, as described.

8. In a dish-cutting machine, a rotary cutter-head carrying one or more knives, a carrier, means whereby said carrier is fed comprising a feed-screw having means for turning it, one element of which is located on said feed-screw, and the other element of which is located on said cutter-head, and means whereby said carrier is withdrawn after the action of the cutting-tool, said withdrawing means being located on the cutter-head, as set forth.

9. In a dish-cutting machine, in combination, a rotary cutter-head, a carrier adapted to be fed toward said cutter-head, its feeding mechanism comprising a screw suitably supported at each end and adapted to slide in its supports, means located on said cutter-head and adapted to engage the edge of the front support of said screw, whereby said screw may be pushed away from the axis of the cutter-

head, and means for returning said screw to its forward position, as set forth.

10. In a dish-cutting machine, a rotary cutter, a carrier, a feed-screw connected with said carrier, a supporting-block adapted to support the front end of said feed-screw, means for reciprocating said carrier and said feed-screw toward and from said cutter-head, and means for locking said carrier when in its forward position, comprising a locking-bar adapted to engage the rear end of said supporting-block, and means for operating it, as and for the purposes set forth.

11. In a dish-cutting machine, a block-carrier, a trimming mechanism whereby the face of said block is shaved, a cutting mechanism whereby a dish is thereafter cut therefrom, means whereby said carrier is brought alternately into position so that the block carried by it will be alternately trimmed and have a dish cut from it, and means whereby said carrier is locked in its forward position comprising a sliding piece connected to said carrier, a lever carrying a sliding arm, and means whereby said lever is moved to carry said arm away from contact with said sliding piece, comprising a cam-surface connected with said cutting mechanism and adapted to engage said sliding arm-lever as described.

12. In a dish-cutting machine, in combination with a dish-cutting knife and a trimming-knife, and means whereby each is operated, a carrier and means whereby it is fed forward progressively, and means whereby it is also given a reciprocating movement forward and back, a slide-pin normally lying across the path of said carrier, and adapted to be engaged thereby, and a latch located to be engaged and normally retained in a rearward position by said slide, and means whereby said latch when out of engagement with said slide will be moved forward into the path of said carrier, as set forth.

13. In a dish-cutting machine, in combination with a dish-cutting knife and a trimming-knife, and means whereby each is operated, a block-carrier and means whereby it is fed progressively forward and is also reciprocated forward and back, means located in the path of the carrier adapted to be engaged thereby, whereby the means for accomplishing the progressive feed of said carrier will be thrown and maintained out of operation, as set forth.

14. A cutter-head support and means whereby it is supported and rotated comprising a table provided with a central opening and an annular recess, an inverted-U-shaped bearing, one leg of which is adapted to set into said recess and the other into said table-opening, and friction-rollers located between said inverted-U-shaped bearing and the upper surface of the edge of said table surrounding said opening, said inverted-U-shaped piece also carrying an annular gear, as described.

15. A revolving cutter-head provided with one or more cutters, a cam mounted on said cutter-head, and located below the same, in combination with a carrier adapted to be reciprocated toward and from said cutter-head, and means to engage said cam, whereby the said carrier may be intermittently reciprocated, as described.

16. In a dish-cutting machine, a cutter-head having a suitable support carrying one or more ears, a carrier mounted upon a feed-screw, the front end of said feed-screw being provided with an armed wheel, the arms of which are located to engage with the ears on said cutter-head support, as described.

17. In a dish-cutting machine, a cutter-head provided with one or more cutters, and one or more straps, each strap extending rearward from the rear of each cutter to within a short distance of the next cutting edge, as shown.

18. In a dish-cutting machine, a stationary table provided with a central opening having an annular supporting edge, a rotary cutter-head having a bearing-surface running on said supporting edge, means for causing the rotation of said cutter-head, means for feeding the block thereto in a line at right angles to the axis of the cutter-head.

19. In a dish-cutting machine, a stationary table provided with a central opening having an annular supporting edge, and a cutter-head having a bearing-surface running on said supporting edge, said cutter-head carrying means such as a gear whereby it may be rotated, the radius of said rotating means being less than the radius of said bearing-surface, whereby greater stability is given to the cutter-head while in operation, in combination with means for feeding a block to said cutter-head in a plane at right angles to said cutter-head and above the plane of said gear, as set forth.

20. In a dish-cutting machine, a table having an annular way thereon, an annular member fitted in said way and having an annular bearing-surface for engagement therewith, a camway on said annular member, a cutting-head carried by said annular member, and a trimming-knife in connection with said cam to be operated thereby across the face of said head.

21. In a dish-cutting machine, a table having an annular way thereon, an annular member fitted in said way and having an annular bearing-surface for engagement therewith, an annular driving-gear on said annular member, a camway on said annular member, a cutting-head carried by said annular member, and a trimming-knife in connection with said cam to be operated thereby across the face of said head.

22. In a dish-cutting machine, a stationary table provided with a central aperture, a cutter-head located within said aperture and having a bearing-surface engaging one edge thereof, a block-feeding mechanism and a block-trimming mechanism, both mounted on said table, and separate means, as described, located on said cutter-head, whereby said block-feeding mechanism and said block-trimming mechanism may each be operated, as set forth.

811,005. **GARMENT-FASTENER.** WILLIAM H. UNER, Duluth, Minn. Filed June 20, 1904. Serial No. 213,260.

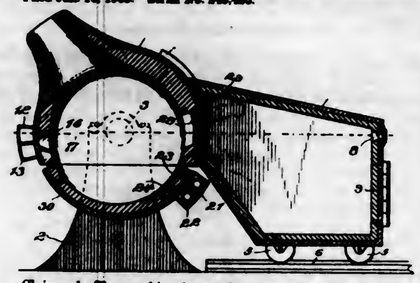
Claim.—1. In a garment-fastener, the combination of a hook member and an eye member, one of which embodies six legs terminating at their lower ends in attaching-eyes, the upper ends of the rearward legs terminating in rearwardly-directed hooks, the inner ends of the two forward legs terminating in a forwardly and upwardly directed hook at a lower plane than the said rearwardly-directed hooks, the other of which members embodies two shank portions terminating at one end in attaching loops or eyes and curved or bent intermediate of their ends to form parallel hooks and terminating at their opposite ends in a single loop underlying an intermediate portion of said shanks parallel with the mutual plane of the portion of said shanks extending from the said eyes to said hooks substantially as described.

2. In a garment-fastener, a hook member and an eye member adapted to be attached to a predetermined portion of the garment and comprising a member formed of a single wire bent to form four attaching loops or eyes in the same plane, with each other, six legs extending from said loops, the rearward leg on each side being near its junction with the intermediate leg on the same side to form a rearwardly-directed hook contacting at its junction with said intermediate leg with the point of junction of the opposite intermediate leg and opposite rearward leg, the forward said legs being bent near their junction to form a forwardly and upwardly directed tongue at a lower plane than said hooks, and a second member provided with attaching loops or eyes, hooks adapted to engage the hooks of the first said member and an eye adapted to engage the tongue of the first said member, said hooks of the said second member being adapted to be pinched together into disengaging position so as to wedge apart and pass between the hooks of the first said member, substantially as described.

3. In a garment-fastener the combination of a hook member and an eye member, adapted to engage each other, one of said members being provided with two hooks and a tongue and garment-attaching portions, and the other of said members being provided with two hook portions adapted in operative position to engage the hooks of the first said member and an eye portion adapted in operative position to engage the tongue of the first said member, and garment-attaching portions, the hook portions of the second said member being laterally compressible and when so compressed being adapted to be disengaged from the other member by movement in the same direction as that which effected the first engagement of said members with each other, substantially as described.

4. In a garment-fastener, the combination of a hook member and an eye member, one of said members having attaching portions for securing the member to the apparel or article for which it is used, said one of said members having two hooks formed thereon contiguous to each other, said one of said members also being provided with a tongue, the other of said members being bent intermediate of its ends to form parallel hooks adapted in normal operative position to engage the hooks on the first said member and being laterally compressible and adapted in compressed releasing position to pass between the hooks of the first said member and out of engagement therewith, the second said member being bent at or near its center to form an eye adapted in operative position to engage the tongue of the first said member, and the second said member being provided with attaching portions for securing said second member to the apparel or article for the use of which it is intended.

811,006. **CONVERTER.** GEORGE T. WALKER, Washington, D. C. Filed Jan. 16, 1905. Serial No. 240,620.



Claim.—1. The combination with a converter, of a slag-receptacle associated therewith, said slag-receptacle being arranged in close contact with said converter in such manner as to exclude the air from said receptacle as far as possible, means in said converter for agitating the metal, and means for removing the slag and impurities from the metal in the converter into the slag-receptacle, substantially as described.

2. The combination with a converter of a slag-receptacle associated therewith, means for facilitating a close contact between said converter and said slag-receptacle in order to exclude the air from said slag-receptacle as far as possible, and means in said converter for removing the slag and impurities from the converter into said slag-receptacle, substantially as described.

3. The combination with a converter of a slag-receptacle associated therewith, said slag-receptacle being constructed to form a close contact with said converter to exclude the air therefrom as far as possible, a double set of twyers in said converter for leading air into the metal to agitate and purify the same, and means for driving the impurities from the metal into the slag-receptacle, substantially as described.

4. The combination with a converter, of a slag-receptacle associated therewith, said converter being provided with an opening leading into said slag-receptacle, a double series of twyers in said converter constructed to lead air or gases into the metal to agitate and purify the same, and a double series of twyers in said converter constructed and arranged to drive the impurities from the surface of the metal into the said slag-receptacle, substantially as described.

5. A converter having twyers arranged for agitating the metal, said converter being provided with an opening therein, and twyers independent of the agitating-twyers for driving the impurities from the metal through the said opening in the converter, substantially as described.

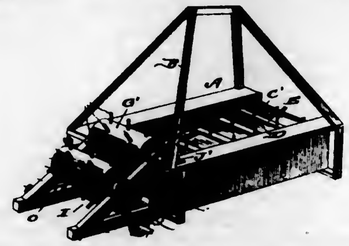
6. The combination with a converter, of a double series of twyers arranged one above the other, and so located as to lead air to the converter below the surface of the metal, to agitate the metal and to drive the slag and impurities to the top thereof, a double series of twyers arranged one above the other and so located as to lead air into the converter against the surface of the metal to drive the slag and impurities therefrom, substantially as described.

7. A converter substantially rectangular in horizontal section, twyers arranged to lead air into the converter below the surface of the metal to agitate the same, and twyers arranged to lead air into the converter against the surface of the metal to drive the slag and impurities therefrom, said converter being provided with an opening through which the slag and impurities are driven, substantially as described.

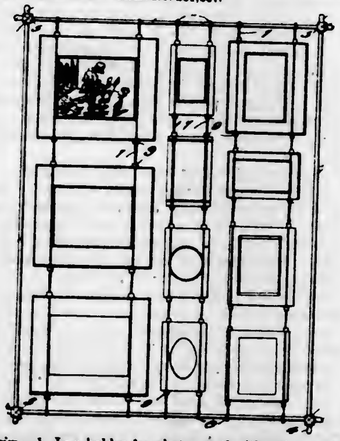
8. The combination with a converter, of a slag-receptacle associated therewith, said slag-receptacle being constructed to form a close contact with said converter in order to exclude the air from said slag-receptacle as far as possible, said converter being provided with an opening leading into said slag-receptacle, and means in said slag-receptacle for allowing a view of the interior of the converter through the said opening therein, substantially as described.

811,007. **SELF-FEEDING ATTACHMENT FOR THRESHING-MACHINES.** JAMES O. WALKER, Hood, Oreg. Filed June 20, 1902. Renewed Aug. 12, 1905. Serial No. 274,612.

Claim.—The combination with a downwardly and forwardly traveling conveyer, of triangular-shaped brackets arranged adjacent the lower forward end of the conveyer and comprising downwardly-inclined beams, a spiked drum rotatably journaled at the upper ends of the brackets, a second spiked drum journaled on the inclined beams intermediate their ends, the said drums being transverse to the conveyer and in a plane approximately parallel to that of the conveyer, a third spiked drum journaled in the brackets below the plane of the conveyer and in a perpendicular plane intermediate the two first-mentioned drums, and means for driving the conveyer and drums.



811,008. **PHOTO-HOLDER.** JODIE WALLICK, Sumpter, Oreg. Filed May 23, 1905. Serial No. 261,007.



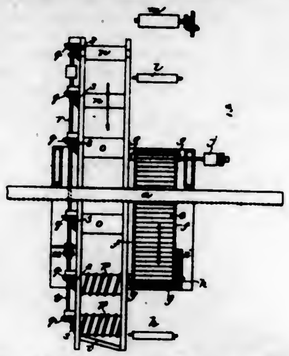
Claim.—1. In a holder for photos or the like, the combination of a frame composed of sides, a plurality of stripe connecting said sides, and members arranged for movement longitudinally of said stripe and coöperating to support photos thereon.

2. In a holder for photos or the like, the combination of a frame, a plurality of stripe connecting sides of the frame and adjustable toward and from each other, and members arranged for movement longitudinally of said stripe and coöperating to support photos thereon.

3. In a holder for photos or the like, the combination of a supporting-frame embodying a plurality of sides, double supporting-stripe connecting sides of said frame and adjustable toward and from each other, said supporting-stripe having end portions thereof looped about sides of the frame for connection therewith and admitting of adjustment of the double stripe toward and from each other, and buttons arranged for movement longitudinally of the double stripe and coöperating therewith to support a photo thereon.

4. In a holder for photos or the like, the combination of a frame comprising sides, a top and bottom, the sides having openings through which end portions of the top and bottom parts pass, knobs fastened to the top and bottom parts at the ends and securing the same to the sides, double photo-supporting wires having loops at the ends thereof receiving the top and bottom parts of the frame for connection therewith, said loops permitting of adjustment of the double wires toward and from each other, and buttons slidable longitudinally of the double wires to coöperate therewith in holding photos thereon.

811,009. RESAWING BAND-MILL. JOHN WALTON, Milwaukee, Wis. Filed Sept. 22, 1904. Serial No. 226,429.



Claim.—1. In a resawing band-mill the combination with the band-wheels and the saw having its working span between said wheels horizontally disposed, a vertically-adjustable feeding-conveyer arranged and movable transversely to the saw and a returning-conveyer arranged alongside of the feeding-conveyer with its receiving end approximately at the level of the delivery end of the feeding-conveyer and its delivery end above the receiving end of said feeding-conveyer and adapted to elevate and return the material to be resawed over the working span of the saw, substantially as described.

2. In a resawing band-mill the combination with the saw and its carrying-wheels, of means for feeding the material to the lower span of the saw, means arranged alongside of the feeding means for returning the material to be resawed between said wheels and between and out of contact with the spans of the saw, substantially as described.

3. In a resawing band-mill the combination with the band-wheels and the saw mounted thereon with its spans horizontally disposed, of means adapted to feed the material to be sawed to the lower span of the saw and means arranged alongside of said feeding means and adapted to return the material to be resawed over and out of contact with the lower span of the saw and between the band-wheels, substantially as described.

4. In a resawing band-mill the combination with a horizontally-disposed band-saw, its carrying-wheels and a feeding-conveyer arranged and movable transversely to the saw, of means for returning the material to be resawed over the working span of the saw between the band-wheels and for delivering it sidewise to the receiving end of said conveyer, substantially as described.

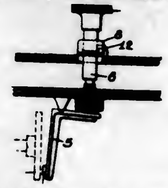
5. In a resawing band-mill the combination with the band-wheels and the band-saw having its spans between said wheels arranged horizontally, of a vertically-adjustable feeding-conveyer arranged below and transversely to the lower span of the saw, and a series of rollers arranged alongside of said conveyer and adapted to return the material to be resawed over the lower span of the saw to the receiving end of said conveyer, the upper sides of the rollers adjacent to the saw projecting above the plane of its lower span, substantially as described.

6. In a resawing band-mill the combination with a horizontally-disposed band-saw and its supporting and driving wheels, of a series of rollers for returning the material to be resawed over the working span of the saw to the feeding-point, the rollers at the rear end of the series having their upper sides approximately on a level with the working span of the saw, the rollers on each side of the saw projecting above said level and the rollers at the front end of the series having screws or spirals adapted to move the returning material sidewise into position to be fed to the saw, substantially as described.

7. In a resawing band-mill the combination with the saw and its carrying-wheels arranged to support the working span of the saw in a horizontal position, of a feeding-conveyer arranged transversely to the saw, a series of rollers arranged alongside of said conveyer to return the material to be resawed over the working span of the saw to the starting-point, the rollers at the front end of the series having screws or spirals adapted to move the material sidewise to the receiving end of said conveyer, and a slanting step in front of the screw-rollers, substantially as described.

8. In a resawing band-mill the combination with the saw and its carrying-wheels arranged to support the working span of the saw horizontally, of means for feeding material to the saw, a series of rollers for returning the material to be resawed to the starting-point, the front rollers of the series having screws or spirals for moving the returning material sidewise to the feeding means, means for turning said rollers and means for connecting and disconnecting the screw-rollers with the driving means at will, substantially as described

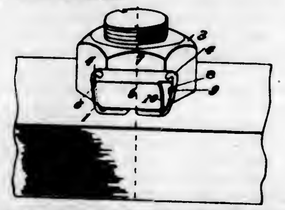
811,010. PHONOGRAPH SPEED-INDEX. PETER WEBER, East Orange, N. J., assignor to New Jersey Patent Company, Orange, N. J., a Corporation of New Jersey. Filed June 20, 1904. Serial No. 214,896.



Claim.—1. The combination with the governor-disk, governing-lever and adjusting-screw of a spring-operated phonograph, of an index carried by the adjusting-screw and coöperating with a stationary scale, and means for preventing the adjusting-screw from being turned more than a complete revolution, substantially as set forth.

2. In a phonograph or the like, and in combination with the speed-adjusting screw, of a finger adjustably carried by the screw, and a stop in the path of said finger.

811,011. NUT-LOCK. JOHN C. WEEMS, Dillards, Ala. Filed Apr. 20, 1905. Serial No. 256,573.



Claim.—1. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward, and a locking-plate having depressions in its ends to engage said upwardly-extending ends and adapted to fit against a flattened side of the nut to prevent it from turning.

2. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward, and having inwardly-projecting lugs or hooks on their ends, and a locking-plate fitting under said inwardly-projecting lugs and having depressions in its ends to engage said upwardly-extending arms of the spring metal, and adapted to fit against a flattened side of the nut to prevent it from turning.

3. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward, and having inwardly-projecting lugs or hooks on their ends, and a locking-plate fitting under said inwardly-projecting lugs and having depressions in its ends to engage said upwardly-extending ends of the spring metal and adapted to fit against a flattened side of the nut to prevent it from turning, and a pin located in a transverse groove in the end of the locking-plate and under the engaging arms of spring metal to enable them to be easily forced apart to release the locking-plate.

4. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward, and having inwardly-projecting lugs or hooks on their ends.

and a locking-plate fitting under said inwardly-projecting lugs and having depressions in its ends to engage said upwardly-extending ends of the spring metal and adapted to fit against a flattened side of the nut to prevent it from turning and also having a shoulder on one of its sides, and a pin located in a transverse groove in the end of the locking-plate and under the engaging arms of spring metal to enable them to be easily forced apart to release the locking-plate, the before-mentioned shoulder being adapted to be used as a rest for a tool or lever used to force said pin outward.

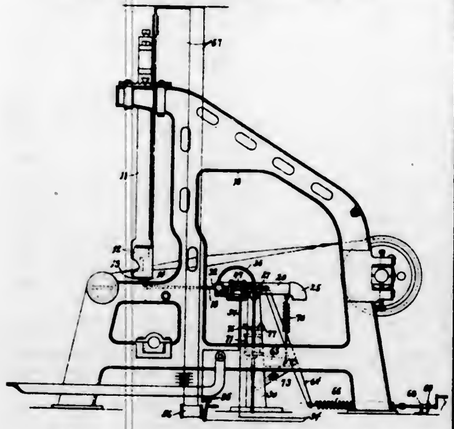
5. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward and having inwardly-projecting lugs or hooks on their ends, and a locking-plate to fit against a flattened side of the nut and having depressions in its ends to engage said upwardly-projecting arms of spring metal and also being formed with inclined ends which serve as a wedge to enable it to be easily forced into position under the inwardly-projecting lugs.

6. In a nut-lock, the combination of a bolt, a nut having a flattened side, a washer formed by bending a piece of spring metal around said bolt and having means to prevent its turning thereon, the ends of said piece of metal being bent back upon themselves and upward and having inwardly-projecting lugs or hooks on their ends, and a locking-plate to fit against a flattened side of the nut and having depressions in its ends to engage said upwardly-projecting arms of spring metal and also being formed with inclined sides which act like a wedge to insure a close engagement with the nut.

7. In a nut-lock, the combination of a member for locking the nut having companion spaced spring-arms, and a lock-plate fitted against a side of the nut and held in place by spring engagement of said arms.

8. In a nut-lock, a washer comprising a wire having its middle portions bent to encircle the bolt and its end portions extended to form spring-arms, and a lock fitted against an edge of the nut and held between the said spring-arms.

811,012. LAY-MOTION FOR LOOMS. ALBERT B. WEISENBORN, Appleton, Wis. Filed June 3, 1905. Serial No. 263,574.



Claim.—1. A lay-motion for looms, comprising a fluid-pressure lay-moving device, and electrical controlling means therefor with its circuit-closer located within free access of the weaver.

2. A lay-motion for looms, comprising a fluid-pressure lay-moving device, and electrical controlling means therefor with its circuit-closer located on the lay-cap of the loom.

3. A lay-motion for looms, comprising a fluid-pressure lay-moving device, and electrical controlling means therefor with its circuit-closer formed by a series of push-buttons on the lay-cap of the loom at different distances from the middle thereof.

4. A lay-motion for looms, comprising a fluid-pressure lay moving and retaining device, and electrical controlling means therefor with its circuit-closer formed of a push-button at each end of the lay-cap of the loom.

5. A lay-motion for looms, comprising a fluid-pressure lay-moving device, and electrical controlling means therefor with its circuit-closer operated by the pressure of the weaver's hand in the usual manipulation of the lay-cap for producing the hand operation of the lay.

6. A lay-motion for looms, comprising a fluid-pressure lay-moving device, fluid-pressure-controlling valves therefor, an electrical valve-operating means, and an electrical controlling-circuit for said valve-operating means having its circuit-closer located on the lay in convenient access to the weaver.

7. A lay-motion for looms, comprising a fluid-pressure lay-moving device, an electrical controlling means therefor having its circuit-closer located in convenient access to the weaver, and a spring lay-moving device opposing the action of the fluid-pressure lay-moving device and adapted to move the lay in the opposite direction to the movement of the lay produced by said fluid-pressure lay-moving device.

8. A lay-motion for looms, comprising a fluid-pressure lay-moving device adapted to produce the rearward movement of the lay, an electrical controlling means therefor having its circuit-closer located in convenient access to the weaver, and a spring lay-moving device adapted to produce the forward movement of the lay.

9. A lay-motion for looms, comprising a fluid-pressure lay-moving device, valves controlling the admission and exhaust of pressure fluid thereof, a lever for actuating said valves, a magnet adapted to cause the movement of the lever, and an electrical controlling-circuit for said magnet having its circuit-closer located in convenient access to the weaver.

10. A lay-motion for looms, comprising a fluid-pressure lay-moving device, pressure-fluid supply and exhaust valves therefor, said valves having exposed valve-stems, a lever pivotally mounted between said valve-stems and adapted when swung in one direction to open the supply-valve and permit the exhaust-valve to close and when swung in the other direction to open the exhaust-valve and permit the supply-valve to close, a magnet for producing the swinging movements of the lever, and an electrical controlling-circuit for said magnet having its circuit-closer located in convenient access to the weaver.

11. A lay-motion for looms, comprising a pressure-fluid lay-moving device formed by a suitably-mounted cylinder with a piston having connection with the lay, said cylinder having a passage-way in connection therewith, a spring-pressed slidably-mounted valve-stem carrying a pressure-fluid-supply valve for the passage-way, a spring-pressed slidably-mounted valve-stem carrying an exhaust-valve for the passage-way, said valve-stems having exposed ends, a lever pivotally mounted between the exposed ends of the valve-stems and adapted when swung in one direction to engage one valve-stem and open the supply-valve thereby and when swung in another direction to engage the other valve-stem and open the exhaust-valve thereby, a magnet for producing the swinging movements of the lever, and an electrical controlling-circuit for the magnet having its circuit-closer located in convenient access to the weaver.

12. A lay-motion for looms, comprising a fluid-pressure lay-moving device, a pressure-fluid supply and exhaust valve mechanism therefor having exposed valve-stems, a valve-lever pivotally mounted between the exposed valve-stems and adapted to engage one or the other thereof as it is moved in one direction or the other, a magnet-frame, a magnet mounted thereon, an armature-lever pivoted to the magnet-frame and having connection with the valve-lever, whereby the attraction of the armature-lever will cause the valve-lever to move in one direction, a bar adjustably mounted on the magnet-frame and passing through the armature-lever, a stop on the bar for limiting the movement of the armature-lever away from the magnet, and a coil-spring surrounding the bar and bearing on the armature-lever to force said armature-lever away from the magnet when the magnet is deënergized and thereby produce a movement of the valve-lever in the other direction, and an electrical controlling-circuit for the magnet having its circuit-closer in convenient access to the weaver.

13. A lay-motion for looms, comprising a pressure-fluid lay-moving device, consisting of a fluid-pressure cylinder having a pivotal support, a piston operating in the cylinder and having a pivotal connection with the lay, and a controlling system for the supply and exhaust of pressure fluid of the cylinder having its operating means located in convenient access to the weaver.

14. A lay-motion for looms, comprising a standard, a bearing having a pivotal support on the standard, a fluid-pressure cylinder having a trunnion pivotally mounted in the bearing, a piston operating in the cylinder, a bolt to which the piston is pivotally connected, said bolt having a pivotal connection with the lay, and an electrically-

controlled pressure-fluid valve mechanism for the cylinder having its circuit-closer in convenient access to the weaver.

15. A lay-motion for looms, comprising a standard, a fluid-pressure cylinder pivotally mounted thereon, a piston operating in the cylinder and having connection with the lay, an electrically-controlled valve mechanism on the cylinder having its circuit-closer located within convenient access to the weaver, and a spring connecting the cylinder with the standard to counterbalance the weight of the valve mechanism.

16. A lay-motion for looms, comprising a suitable pivotally-mounted fluid-pressure cylinder, a piston operating therein, a stud to which the piston-rod is connected, a bolt pivotally mounted on the stud, and a cleat connected to the lay and having a swivel connection with the bolt.

17. A lay-motion for looms, comprising a suitable pivotally-mounted fluid-pressure cylinder, a piston operating therein, a stud to which the piston-rod is connected, a bolt pivotally mounted on the stud, a cleat connected to the lay and having a swivel connection with the bolt, a connecting-rod pivotally mounted on the stud, and a spring-operated lay-moving mechanism connected to the connecting-rod.

18. A lay-motion for looms, comprising a standard, a fluid-pressure cylinder pivotally mounted thereon, a piston operating in the cylinder and having a piston-rod with a forked end, a stud connected to the forked end of the piston-rod, a bolt pivotally mounted on the stud between the fork members of the end of the piston-rod, a cleat on the lay having a swivel connection with the bolt, a connecting-rod pivoted to the stud, a rock-lever pivotally mounted on the standard and connected to the connecting-rod, and an adjustable spring connected to the rock-lever.

19. A lay-motion for looms, comprising a standard, a fluid-pressure cylinder pivotally mounted thereon, a piston operating in the cylinder and having a pivotal connection with the lay, a connecting-rod also having a pivotal connection with the lay, a rock-lever pivotally mounted on the standard and connected to the connecting-rod, and a dash-pot having its stem in the path of movement of the rock-lever.

20. A lay-motion for looms, comprising a standard, a fluid-pressure cylinder pivotally mounted thereon, a piston operating in the cylinder and having a pivotal connection with the lay, a connecting-rod also having a pivotal connection with the lay, a rock-lever pivotally mounted on the standard and connected to the connecting-rod, a dash-pot having its stem in the path of movement of the rock-lever, and an adjustable stop adapted to be engaged by the stem of the dash-pot to limit the movement of the lay.

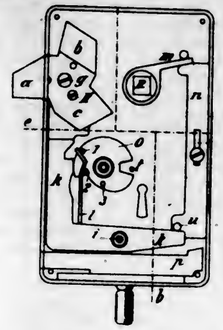
21. A lay-motion for loom, comprising a standard, a fluid-pressure cylinder pivotally mounted thereon, a piston operating in the cylinder and having a pivotal connection with the lay, a connecting-rod also having a pivotal connection with the lay, a rock-lever pivotally mounted on the standard and connected to the connecting-rod, a dash-pot having its stem passing entirely therethrough with its lower end in the path of movement of a part of the rock-lever, an adjustable stop adapted to be engaged by the other end of the dash-pot stem to limit the movement of the lay, and a petcock and check-valve connected to the dash-pot.

22. A lay-motion for looms, comprising a fluid-pressure lay-moving device, an electrical controlling means therefor having its circuit-closer formed by a sheet-metal shell secured to the lay-cap of the loom, spring-strips connected thereto, buttons mounted on the spring-strips and projecting through openings in the sheet-metal shell, a strip of insulating material mounted on the sheet-metal shell, and a series of spring-contacts carried thereby.

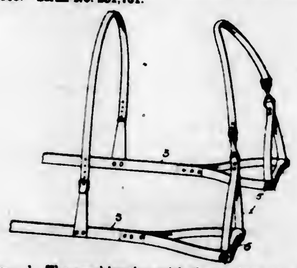
23. A lay-motion for looms, comprising a fluid-pressure lay-moving device, an electrical controlling means therefor consisting of a valve-operating magnet, an electrical circuit therefor containing a relay-switch, and a second electrical circuit including the magnet of the relay-switch and having its circuit-closer located within convenient access to the weaver.

811,013. DOOR-LOCK. THEODOR WEISSER, Heidelberg, Germany. Filed Mar. 20, 1905. Serial No. 250,668.

Claim.—An improved lock adapted to be used as a right or left hand and as a rim or cupboard or mortise lock, having a tumbler *b* carrying a star or the like formed with three heads *a*, *b*, *c*, each serving as a latch or bolt for a particular purpose, said star being rotatably attached to the tumbler by a screw *g* and adapted to be fixed by a screw H on said tumbler so that either the head *a*, serving as a lifting-latch, or either of the other tapered heads *b*, *c*, serving as right and left hand sliding bolts respectively, may be made to project through the side of the case, all for the purposes and substantially as described and illustrated.



811,014. HOPPLE. FRANK D. WELLER, Toledo, Ohio. Filed Mar. 24, 1905. Serial No. 251,731.



Claim.—1. The combination with the leg-loop of a hopple, of a rotatable element mounted therein to have contact with the leg.

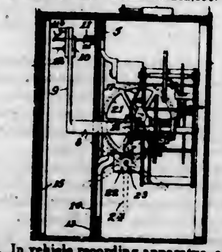
2. The combination with the leg-loop of a hopple, of a rotatable element mounted therein and having a peripherally-concaved surface for contact with the leg.

3. The combination with the leg-loop of a hopple, of a spindle mounted transversely of the outer end of the loop and firmly spacing the sides thereof apart, and a rotatable element mounted on said spindle between the sides of the loop.

4. In a hopple, the leg-loops each provided at the outer ends thereof with a rotatable element adapted to have contact with the legs and to retain the sides of the loops out of frictional engagement therewith.

5. A hopple, comprising leg-loops and supporting-straps therefor, said leg-loops each consisting of side straps or members, a spindle mounted in the outer ends of said straps or members and spacing them firmly apart, and a rotatable element mounted on the spindle between the straps or members.

811,015. VEHICLE-RECORDER. JOHN T. WHALEN, Brooklyn, N. Y. Filed May 27, 1905. Serial No. 262,696.



Claim.—1. In vehicle-recording apparatus, a time-train having a prime mover and a shaft rotated thereby, a stationary record-disk having divisions of time indicated thereon in convolute form, a marker, means actuated by said shaft to rotate said marker, means imparting radial movement to said marker in its rotation, and mechanical means controlled by the movement of the vehicle for intermittently moving said marker toward said disk.

2. In vehicle recording apparatus, a time-train having a prime mover and a shaft rotated thereby, a stationary record-disk having divisions of time indicated thereon in convolute form, a slidable extension for said shaft, a radial arm carried by said extension and a marker extending from said arm, together with means imparting convolute movement to said marker in its rotation.

3. In vehicle recording apparatus, a time-train having a prime mover and a shaft rotated thereby, a stationary record-disk having divisions of time indicated thereon in convolute form, a slidable extension for said shaft, a radial arm carried by said extension and a marker extending from said arm, together with means imparting convolute movement to said marker in its rotation, and means controlled by the movement of the vehicle for intermittently moving said marker toward said disk.

4. In vehicle recording apparatus, a time-train having a prime mover and a shaft rotated thereby, a sleeve rotatable with and slidable upon said shaft, an arm extending radially from said sleeve, a slide upon said arm, carrying on opposite sides a pointer and a wheel, a disk having a convolute groove or way to receive said wheel, a disk having divisions of time marked thereon in convolute form, means controlled by the movement of the vehicle to intermittently impel said pointer against said disk, means retracting said pointer, and means retaining the wheel within its groove or way during the impulses of the pointer.

5. In vehicle recording apparatus, a record-disk having divisions of time indicated thereon in convolute form, a marker adapted to rotate convolutely in proximity to said disk, a time-train to actuate said marker, a cam to move said marker intermittently against said disk, to register indications thereon, and means communicating motion from a wheel of the vehicle to said marker.

6. In vehicle recording apparatus, a record-disk having divisions of time indicated thereon in convolute form, a marker adapted to rotate convolutely in proximity to said disk, a time-train to actuate said marker, a cam to move said marker intermittently against said disk, to register indications thereon, means retracting said marker, and means communicating motion from a wheel of the vehicle to said cam.

7. In vehicle recording apparatus, a record-disk, a duplex marker adapted to rotate in proximity to said disk, separate cams adapted to move said marker intermittently against said disk in manner to register different indications thereon, and means communicating motion from a wheel of the vehicle to said cams, causing them respectively to actuate the marker at the completion of set less and greater distances traveled.

8. In vehicle recording apparatus, a record-disk having divisions of time indicated thereon in convolute form, a marker adapted to rotate convolutely in proximity to said disk, a time-train to actuate said marker, a cam to move said marker intermittently against said disk, to register indications thereon, a cam-shaft, an audible signal device, means upon said cam-shaft to intermittently actuate said signal, and means communicating motion from a wheel of the vehicle to said cam-shaft.

9. In vehicle recording apparatus, a record-disk having divisions of time indicated thereon in convolute form, a marker adapted to rotate convolutely in proximity to said disk, a time-train to actuate said marker, a cam-shaft, means communicating motion from a wheel of the vehicle to said cam-shaft, a cam loose upon said cam-shaft to move said marker intermittently against said disk, means upon said cam-shaft to rotate the cam therewith, and tensional means for moving the cam at the end of the marker movement in advance of the rotation of the cam-shaft.

811,016. BOILER-TUBE. JOHN WHYTE and ARTHUR M. CROSSLEY, Glasgow, Scotland. Filed July 12, 1905. Serial No. 269,314.

Claim.—A boiler-tube provided throughout its length with a continuously and axially straight passage said tube having offset sections whose axes are parallel with the axis of said tube, substantially as described.

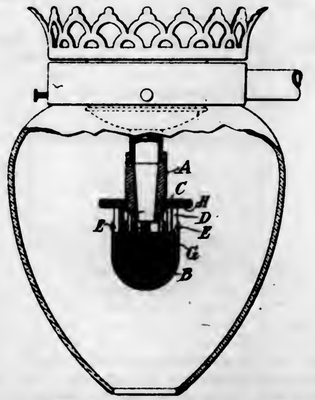
811,017. PROCESS OF MAKING MANTLES. OSCAR WIEDENFELD, Jersey City, N. J. Filed Mar. 6, 1905. Serial No. 248,688.

Claim.—1. The herein-described process of producing textile fabric for incandescent mantles, which consists in forming the same from raw threads containing impurities detrimental to the production of perfect impregnation, but beneficial to the formation of the fabric, then removing the impurities by subjecting the fabric to a suitable reagent, and removing the reagent together with the impurities, and then impregnating with incandescing material.

2. The herein-described process of producing textile fabric for incandescent mantles, which consists in forming the same from raw threads containing impurities detrimental to the production of perfect impregnation, but beneficial to the formation of the fabric, then removing the impurities by subjecting the fabric to a suitable bleaching reagent, and removing the bleaching reagent together with the impurities, and then impregnating with incandescing material.

3. The herein-described process of producing textile fabric for incandescent mantles, which consists in forming the same from threads containing impurities detrimental to the production of perfect impregnation, but beneficial to the formation of the fabric, then removing the impurities by subjecting the fabric to a suitable reagent, and removing the reagent together with the impurities, and then impregnating with incandescing material.

811,018. HOLDER FOR INCANDESCING MANTLES. OSCAR WIEDENFELD, Jersey City, N. J. Filed Mar. 7, 1905. Serial No. 249,143.



Claim.—1. In combination a ring and a mantle attached thereto with its edge spaced apart from the ring to permit the escape of products of combustion.

2. A holder for mantles adapted for attachment to a mantle and adapted to screw on the end of a gas-tip, whereby the mantle is held rigidly on the tip and is adjustable in height.

3. In combination, a mantle-holder for depending mantles and having a plurality of depending fingers, and a mantle depending from said holder and having its upper edge held against the lower ends of said depending fingers whereby it is supported and held from collapsing inward by said fingers.

4. A holder for depending mantles having a ring adapted to be fastened on the gas-tip, and a plurality of depending fingers the ends of which are adapted to engage and support the mantle.

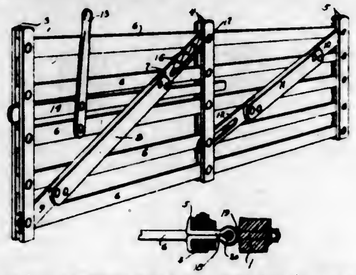
5. In combination, a holder having a plurality of points of suspension spaced apart from each other, and a mantle attached to the holder by a cord passing around and holding the edge of the mantle against said points.

6. In combination a ring and a mantle suspended with its upper edge a distance below said ring, spaces being left between said ring and the edge of the mantle for the escape of products of combustion.

7. A holder for depending mantles having a plurality of depending fingers D, the lower ends of which are provided with groove G for holding the edge of the mantle, and which are spaced apart

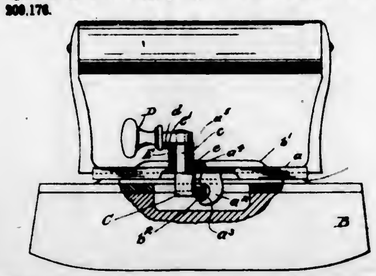
from each other, and having a ring H at the upper end adapted to deflect the gases downward, said holder having a provision for fastening it on a gas-tip.

811,019. GATE. JOHN J. WILLAHAN, Canton, Ohio. Filed June 27, 1905. Serial No. 267,269.



Claim.—The combination of a gate consisting of a frame composed of horizontal bars and vertical members, the vertical members located at the ends of the horizontal bars and intermediate their ends respectively, said parts pivotally connected together, a notched bar located between the intermediate vertical members and adapted to move longitudinally, means for holding the notched bar against longitudinal movement, a pivoted bar provided with a slot at its free end, said notched bar and slotted bar pivoted at their top and bottom ends respectively, a sliding catch-bolt and an operating-handle pivotally attached to said catch-bolt, substantially as and for the purpose specified.

811,020. SAD-IRON HANDLE. CARL WINTER, Chicago, Ill., assignor to Carl Gaebel, Chicago, Ill. Filed May 23, 1904. Serial No. 209,176.



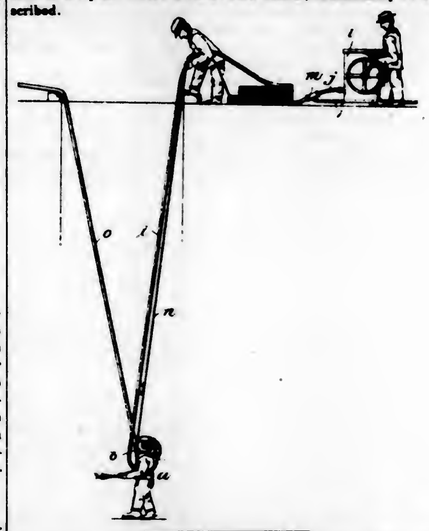
Claim.—1. The combination with a sad-iron handle, of a pair of locking-jaws arranged at some distance apart and adapted to engage with the locking-bar of a sad-iron, a vertically-pivoted locking-cam, also adapted to engage with said bar on the opposite side from said jaws and at a point about midway between said jaws, means for holding said cam in locking position and a handle for releasing said cam.

2. The combination with a sad-iron handle, of depending locking-jaws having beveled engaging surfaces for engaging with a locking-bar of a sad-iron, a vertically-pivoted cam member having a beveled edge for convenience in placing the handle in engaging position a spring for urging said cam into locking position and a handle for releasing said cam.

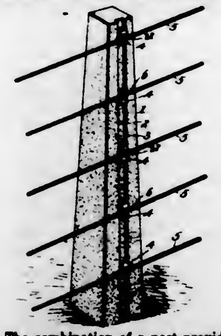
3. The combination with a sad-iron provided with a locking-bar, of a handle, two depending lugs on said handle provided with inclined surfaces adapted to engage with said locking-bar, a vertically-pivoted cam member adapted to engage with the opposite side of said locking-bar at a point about midway between said lugs, a spring for holding said cam in locking position, and a handle for turning said cam, the arrangement being such that the cam will coact with the beveled surfaces of the lugs to draw the handle into close engagement with the sad-iron and rigidly hold the same and will also take up any lost motion due to wear or different-sized locking-bars.

811,021. FIREMAN'S PROTECTIVE DRESS. CHARLES W. WOOD, New Orleans, La. Filed Apr. 17, 1905. Serial No. 256,056.

Claim.—In a fireman's protective dress, the combination of waterproof clothing, a helmet, a cap over said helmet, a water-pipe connected to said cap, an air-pipe connected to said helmet, and a union joint, said air-pipe being contained within said water-pipe except at or near the point where it enters said helmet, substantially as described.



811,022. CONCRETE FENCE-POST. HERBERT S. YOUNG, Bayrout, N. D. Filed June 1, 1905. Serial No. 263,216.



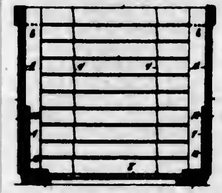
Claim.—1. The combination of a post provided with a recess having opposite walls, a clamping-plate fitted between the walls and adapted to force a wire into the recess to form an abrupt bend for preventing the wire from slipping, and fastening means for adjustably securing the clamping-plate to the post.

2. The combination of a post having a recess and provided with a groove extending across the walls of the recess and forming a wire-receiving seat, and fastening means having a clamping-plate fitting in the recess and forcing the wire into the recess and the groove, whereby an abrupt bend is formed in the wire to prevent the latter from slipping, said clamping-plate being retained from movement by the recess.

3. The combination of a post provided with a longitudinal recess and having transverse grooves extending across the recess and terminating short of the opposite side faces of the post, clamping-plates fitted between the opposite walls of the recess and adapted to force wires into the same to form abrupt bends, and fastening means piercing the post and the clamping-plates and adjustably securing the latter to the former.

811,023. SLATTED CRATE. HENRY H. BACHUS, Detroit, Mich. Filed Apr. 7, 1903. Serial No. 151,514.

Claim.—1. In a slatted box or package, the combination of a horizontally-slatted fabric comprising the walls of the package, the upper slats of the wall being relatively thin and light and the lower slats of the wall being reinforced for their entire length by an additional slat, or slats, forming a double-slatted wall at or adjacent the bottom.

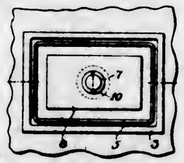


2. In a box, or package, the combination of a slatted fabric forming the walls of the package the slats of the fabric being bound together by metal strands, the slats at the lower edge of the wall being doubled for their entire length to add lateral strength thereto, the metal strands embracing the double slats to bind them firmly together.

3. In a box, or package, the combination of the slatted fabric forming the walls of the package, posts at the corners of said package supporting said slats, a reinforcing-slat added to the inner face of the lower horizontal slat of the wall and extending longitudinally thereof, said posts having recesses in their face to receive said reinforcing-slat.

4. In a box, or package, the combination of a fabric forming the walls of the package, said fabric comprising horizontal slats bound together by metal strands posts uniting the walls at the corners, the slats forming the upper portion of the wall being thin and the slats at the lower portion of the wall being reinforced by additional horizontal slats extending between the posts parallel with and secured to the main slat.

811,024. LUBRICATOR. EDGAR W. BAIRD and JOHN P. DURKIN, Philadelphia, Pa., assignors to Standard Automatic Lubricator Company, Camden, N. J., a Corporation of New Jersey. Filed Dec. 23, 1904. Serial No. 238,066.



Claim.—1. A lubricator having a valve comprising a coil that is closed to prevent feeding while at rest and opened by vibration to permit feeding.

2. A lubricator comprising an oil-receptacle having an outlet, a coiled spring connected with said outlet and normally cutting off the flow thereto from said receptacle, and a weight supported by said spring.

3. A lubricator comprising an oil-receptacle having an outlet, a spring having normally closed coils adapted for preventing flow from said receptacle to said outlet, and means for effecting capillary feeding within said spring.

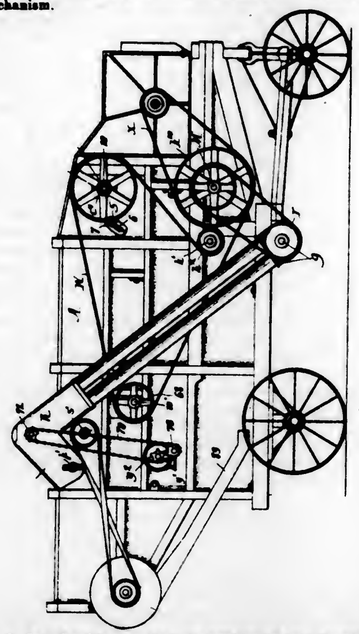
4. A lubricator comprising a receptacle having an opening, a cylindrical spring having normally closed coils connected to said opening, wicking within said spring and a bearing to which said wicking feeds.

5. The combination of a receptacle having an opening, with a valve comprising a coil that normally closes said opening and is operated by vibration.

811,025. THRESHING-MACHINE. BETSY C. BAKER, Minneapolis, Minn. Filed May 11, 1903. Serial No. 156,889.

Claim.—1. In a threshing-machine, a beater comprising a revoluble casing provided with a series of bars extending lengthwise thereof and having inwardly-curved plates extending lengthwise of the beater between said bars, said bars being formed with openings therethrough, and a series of beater-fingers projecting through said bars and a crank-shaft within the casing of said beater whereon said beater-fingers are revolubly mounted.

2. In a threshing-machine, the combination of a threshing-cylinder, its concave, means located in the forward and upper portion of the machine for moving the straw upwardly and rearwardly from the concave, a straw rack or carrier extending along the lower part of the machine, means for delivering an air-blast to the straw as it falls from the rear end of the upper straw-moving mechanism to the front end of the lower straw-moving mechanism, means for collecting the grain beneath the lower straw-moving mechanism, grain-cleaning mechanism located above the rear end of the lower straw-moving mechanism and means for conveying the grain from beneath the lower straw-moving mechanism to the elevated grain-cleaning mechanism.



3. In a threshing-machine, the combination of a threshing-cylinder, its concave, means for moving the straw rearwardly along the upper portion of the machine from said concave, a straw rack or carrier extending along the lower and rear part of the machine, means for delivering an air-blast to the straw as it falls to the front end of the lower straw rack or carrier, a shield extending downwardly from the upper part of the machine opposite the air-blast passage, grain-cleaning mechanism located at the rear of said shield and above the rear end of the lower straw rack or carrier, means for collecting the grain beneath said straw rack or carrier and means for conveying the grain from beneath said lower straw rack or carrier to said elevated cleaning mechanism at the rear of the machine.

4. A threshing-machine comprising a threshing-cylinder and its concave, a grain-receiving pan or conveyer beneath said concave, an auger-casing into which said pan or conveyer discharges, a short straw rack or carrier arranged in the upper part of the machine, an inclined grain-receiving pan or conveyer located beneath said straw rack or carrier and arranged to discharge onto the pan or conveyer beneath the concave, a lower straw rack or carrier arranged along the lower part of the rear of the machine, a grain-conveyer extending beneath said lower straw rack or carrier and arranged to discharge into said auger-casing and means for delivering an air-blast to the straw as it passes from the upper to the lower straw rack or carrier.

5. A threshing-machine comprising a threshing-cylinder, its concave, a beater and its grate at the rear of said cylinder, a short straw rack or carrier arranged adjacent the beater-grate and in position to receive the straw as it passes therefrom, a grain-receiving pan or plate beneath said straw rack or carrier, a fan-casing and fan arranged below said straw rack or carrier and a second straw rack or carrier extending along the rear portion of the machine adjacent its bottom and a conveyer extending beneath said lower straw rack or carrier.

6. A threshing-machine comprising in combination a threshing-cylinder, its concave, means located in the forward and upper portion of the machine for moving the straw rearwardly and upwardly from the concave, a straw rack or carrier extending along the lower part of the machine, means for delivering an air-blast to the straw as it falls from the rear end of the upper straw-moving mechanism to the front end of the lower straw-moving mechanism, a grain-auger casing located in the rear part of the machine above the lower straw rack or carrier, means for elevating the grain, &c., first separated from the straw from below the lower straw rack or carrier to the upper grain-auger casing, a drum or casing arranged to receive the grain from the upper end of said elevating means and extending transversely of the upper part of the machine and provided with an opening through which the grain will be discharged, a shoe located below and at the rear of said drum or casing and provided with one or more sieves, an air-blast pipe arranged at the front of said shoe and serving to deliver a blast of air through the grain as it falls from said drum or casing, a receptacle below said air-blast pipe for the cleaned grain, and a second receptacle adjacent the lower end of the shoe-bottom to receive the material from the shoe.

7. A threshing-machine comprising in combination a threshing-cylinder, its concave, means located in the forward and upper portion of the machine for moving the straw rearwardly and upwardly from the concave, a straw rack or carrier extending along the lower part of the machine, means for delivering an air-blast to the straw as it falls from the rear end of the upper straw-moving mechanism to the front end of the lower straw-moving mechanism, a grain-auger casing wherein the grain, &c., first separated from the straw, is received, an elevator connected with said auger-casing, a drum or casing arranged to receive the grain from the upper end of said elevator and extending transversely of the upper part of the machine above the lower straw-moving mechanism, said drum or casing being provided with an opening through which the grain will be discharged, means for delivering a blast of air through the grain as it falls from said drum or casing, a shoe arranged below and at the rear of said drum or casing and provided with a sieve in its upper portion, and with a receptacle at its rear end to catch the material passing from said sieve, and mechanism whereby the material from said receptacle is returned to the drum or casing to be again subjected to the air-blast.

8. A threshing-machine comprising the combination with the grain-auger casing wherein the grain, &c., first separated from the straw, is received, of an elevator connected with said auger-casing, a drum or casing arranged to receive the grain from the upper end of said elevator, and extending transversely of the upper part of the machine at its rear, and provided with an opening through which the grain will be discharged, means for delivering a blast of air through the grain as it falls from said drum or casing, means for receiving and conveying away the cleaned grain, a shoe extending rearwardly from beneath said drum or casing, and provided at its upper portion with a sieve and at its rear end with a receptacle for the material passing from said sieve, and a cleaner or agitator connected with said receptacle and comprising an expanded casing having revoluble blades therein, and a spout leading from said expanded casing and serving to conduct the material back to the conveyer of the machine.

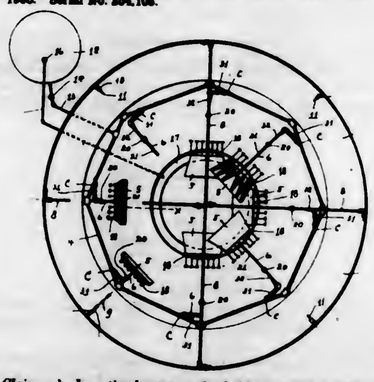
9. A threshing-machine comprising the combination with the grain-auger casing wherein the grain, &c., first separated from the straw is received, of an elevator connected with said auger-casing, a drum or casing arranged to receive the grain from the upper end of said elevator and extending transversely of the upper part of the machine and provided with an opening through which the grain will be discharged, a shoe arranged at the rear of said drum or casing and provided at its upper portion with a sieve and at its rear with a rack or grating and with a receptacle for the material passing off said sieve, said shoe being provided with a downwardly and forwardly inclined bottom, a receptacle to catch the material passing down said bottom, an air-blast pipe arranged below and in front of the discharge-opening of said drum or casing and a receptacle in front of said shoe to receive the clean grain falling from said casing.

10. A threshing-machine comprising a threshing-cylinder, its concave, means for moving the straw rearwardly from said concave for a short distance along the upper part of the machine, a straw rack or carrier located along the lower part of the machine and extending to the rear thereof, an air-blast pipe located at the front of said lower straw-carrier, suitable means for collecting the grain separated from the straw during its passage in the upper, rear part of the machine above said lowermost straw-carrier, conveyer mechanism for raising the grain to said drum or casing, means for delivering an air-blast to the grain as it falls from said drum or casing and a receptacle for catching the grain as it falls from said drum or casing.

11. A threshing-machine comprising a combination of a threshing-cylinder and concave, means located at the rear of the concave and in the upper, front portion of the machine for conducting the straw from the concave, a deflecting plate or shield located about centrally of the machine and extending across the same from the top toward the bottom, a blast-fan located in front of said shield and arranged to force a blast of air through the straw as it falls from the upper straw-moving mechanism, a straw-carrier located in the bottom and rear portion of the machine below said plate or shield for conveying the straw rearwardly from the machine, a grain-auger casing wherein the grain first separated from the straw is received, an elevator leading upwardly and rearwardly from said grain-auger casing, a drum or casing arranged in the upper, rear portion of the machine behind said plate or shield to receive the grain from the upper end of said elevator and extending transversely of the machine and provided with an opening through which the grain will be discharged, a shoe arranged at the rear of and beneath said drum or casing, means for delivering a blast of air through the grain as it falls from said grain-auger casing and separate receptacles for receiving the clean grain and material from said shoe.

12. A threshing-machine comprising the combination with the grain-auger casing, of elevators leading upwardly from the ends of said auger-casing, a drum or casing arranged in the upper part of the machine to receive the grain from said elevators and extending transversely of the machine, the lower part of said drum or casing being provided with an opening of variable width through which the grain will be discharged, reversely-arranged augers for distributing the elevated grain along said drum or casing, means for delivering a blast of air through the grain as it falls from said drum or casing and means for receiving and conveying away the cleaned grain.

811,026. **TIRE-HEATER.** JAMES H. BANCROFT, Toledo, Ohio, assignor of one-half to Charles M. Milroy, Toledo, Ohio. Filed Apr. 6, 1905. Serial No. 254,108.



Claim.—1. In a tire-heater, a tire-bridge provided with a supporting wind-shield, a fuel-supply manifold, branch outlets swivel-jointed and spring-pressed radially inward from the manifold, each outlet having a burner-head and means to raise each head toward the shield.

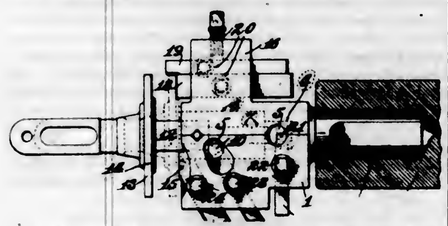
2. In a tire-heater, a vat-like inclosure having a tire-bridge and a circular trough-like starting-pan, a fuel-supply manifold having branch outlets provided with burner-heads and jointed to permit dipping of the heads toward the starting-pan.

811,027. **TRIMMING-TOOL.** GEORGE D. BARLOW, St. Louis, Mo., assignor to The American Brake Company, St. Louis, Mo., a Corporation of Missouri. Filed June 5, 1905. Serial No. 263,853.

Claim.—1. A tool comprising a cutter-head having a longitudinal bore, a spindle-end-trimming cutter carried by the head and projecting into the bore, a bushing carried by and within the bore, said bushing being approximately cylindrical and having a shoulder, a cutter projecting through the head and alining with the shoulder, a cutter having one edge within the bore and the other cutting edge extending slightly beyond the end of the head, and a face-trimming cutter carried by the outer portion of said head; substantially as described.

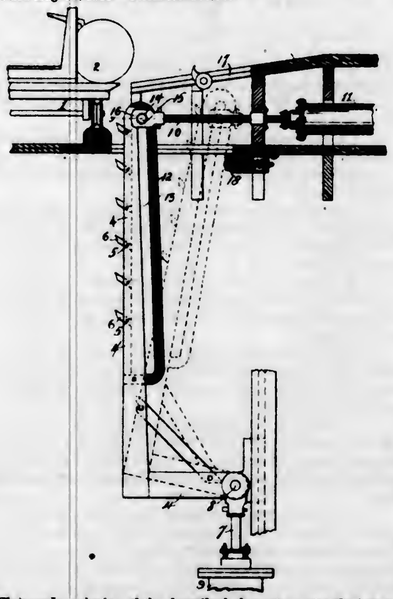
2. A tool comprising a cutter-head having a longitudinal bore,

a spindle-end-trimming cutter carried by the head and projecting into the bore, a bushing carried by and within the bore, said bushing being approximately cylindrical and having a shoulder, a cutter projecting through the head and alining with the shoulder, a cutter having one edge within the bore and the other cutting edge extending slightly beyond the end of the head, a face-trimming cutter carried by the outer portion of said head, and an edge-trimming cutter carried by the said head; substantially as described.



3. In a tool of the class described, the combination with a head having a bore therein, a bushing in the bore having a longitudinal opening alining therewith and of relatively smaller diameter, the opening near the free end of the bushing being larger than the remaining portion, a cutter 21 carried by said head and projecting into the bore, a cutter 9 having its cutting edge adjacent to the wall of the opening in the bushing, and a cutter 15 having one cutting edge adjacent to the wall of the larger portion of the opening in the bushing-block and another cutting edge at the end of the head; substantially as described.

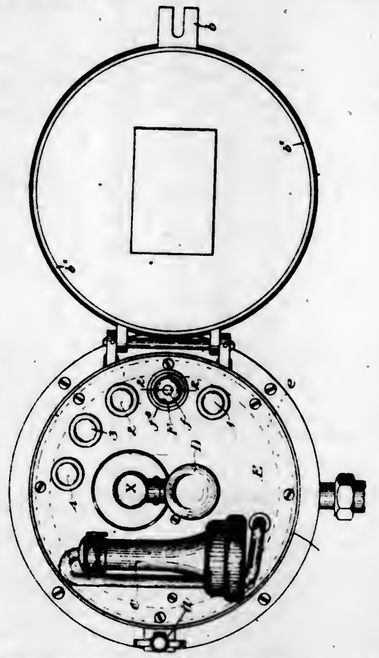
811,028. **LOG-TURNER.** FRED W. BETTNER, Traverse City, Mich. Filed Aug. 26, 1905. Serial No. 276,013.



Claim.—In a device of the described character, a toothed member, a piston-rod pivotally connected with and adapted to impart longitudinal movement to said toothed member, and another piston-rod pivotally and slidably connected with and adapted to impart transverse movement to said toothed member.

811,029. **TELEPHONE FOR SHIPS, MINES, &c.** ARTHUR F. BOARDMAN, Somerville, Mass., assignor to Electric Gas Lighting Company, Boston, Mass., a Corporation of Maine. Filed Apr. 10, 1905. Serial No. 254,648.

Claim.—1. In a telephone, the combination with the case A, its door B and plate E of a telephone-receiver C, telephone-transmitter X, a mouthpiece D for the transmitter, one or more push-button calls, and a contact maker and breaker F composed of the proper attaching and holding devices and the rod f, spring f', spring-contacts f^4, f^4, insulator f^3, holding-nut f^5 and contact-ring f^6; substantially as described and shown.



2. In a telephone, the combination with the case A, door B of a plate E, a waterproof gasket e supporting said plate, a telephone-receiver C, telephone-transmitter X, a mouthpiece D for the transmitter, one or more push-button calls, and a contact maker and breaker F composed of the proper attaching and holding devices and the rod f, spring f', spring-contacts f^4, f^4, insulator f^3, holding-nut f^5 and contact-ring f^6; substantially as described and shown.

811,030. **MACHINE FOR BLACKING SHOES.** FREDERICK H. BREWSTER, Auburn, N. Y. Filed Nov. 3, 1904. Serial No. 231,258.

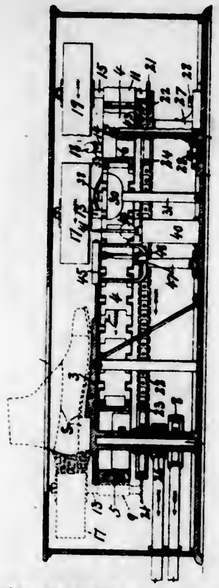
Claim.—1. In a machine for cleaning and blacking shoes, the combination with a foot-rest, of an endless chain or belt traveling around the foot-rest, means to actuate the chain or belt, brushes rotatingly mounted on said chain or belt one in advance of the other, means including a second chain for rotating the brushes, separate driving means for the second chain, and additional means actuated by the first-named chain for applying blacking to one of the brushes.

2. In a machine for cleaning and blacking shoes, the combination with a foot-rest, of an endless chain or belt traveling around the foot-rest, means to actuate the chain or belt, a blacking-brush rotatingly mounted on the chain, means to rotate the brush while the chain is in motion, and additional means to apply blacking to said brush during its rotation.

3. In a machine for blacking shoes, the combination with a foot-rest, of an endless chain or belt traveling around the foot-rest, driving means for the chain or belt, a blacking-brush rotatingly mounted on the chain, a cam on the chain, means actuated by said cam to apply blacking to the brush while in motion, a cleaning-brush rotatingly mounted on the chain or belt, and means connected to rotate both brushes during the movement of the chain or belt.

4. In a machine for cleaning, blacking and polishing shoes, the combination with a foot-rest, of an endless belt traveling around the foot-rest and driving means therefor, a series of brushes rotatingly mounted on the belt one in advance of the other, means operatively

connected to rotate said brushes during the movement of the belt, additional means to apply moisture to one of the brushes, and further means for applying blacking to the moistened brush during its rotation.



5. In a machine for blacking shoes, the combination with a foot-rest, of an endless carrier traveling around the foot-rest and driving means for said carrier, a blacking-dauber yieldingly mounted on the carrier, a receptacle containing blacking, means to cause the dauber to dip into the receptacle during the movement of the carrier, a polishing-brush rotatingly mounted on the carrier and separate means to rotate the brush.

6. In a machine for blacking shoes, the combination with an endless chain and driving means therefor, of a series of brushes rotatingly mounted on the chain, means including a second chain for rotating said brushes during the movement of the first-named chain, separate driving means for the second chain, a spraying device for applying moisture to one of the brushes, means on the first-named chain for actuating the spraying device, and a blacking-holder actuated by the last-named means for applying blacking to the moistened brush.

7. In a shoe-blacking machine, the combination with an endless chain having a series of vertical bearings, of rotary brushes journaled in said bearings, driving means for the chain, additional means for rotating the brushes, a spraying device for applying moisture to one of the brushes, a separate device for applying blacking to the moistened brush, and a cam on the belt for actuating said devices.

8. In a shoe-blacking machine, the combination with a foot-rest, an endless belt traveling around the foot-rest, and driving means for the belt, of brushes rotatingly mounted on the belt, separate means for rotating the brushes, a blacking-holder movable toward and from one of the brushes and means including a cam on the belt in proximity to the last-named brush for moving the blacking-holder toward said brush.

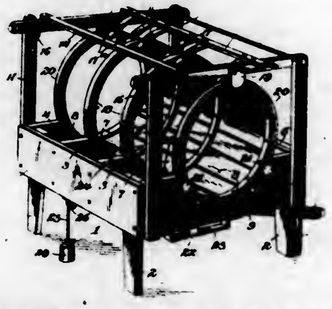
9. In a shoe-blacking machine, an endless belt and separate supporting-drums therefor, in combination with means to rotate one of the drums whereby motion is transmitted to the belt, additional drums each revolving about the axis of one of the first-named drums, a second belt on the additional drums, brushes rotatingly mounted on the first-named belt, and means actuated by the second belt for rotating said brushes.

10. In a shoe-blacking machine, two separate endless chain belts and separate driving mechanisms therefor, a brush rotatingly mounted on one of the belts, and means to transmit motion from the other belt to the brush for rotating said brush.

11. In a shoe-blacking machine, the combination with a foot-rest, of an endless carrier traveling around the foot-rest, driving means for the carrier, brushes mounted on the carrier one in advance of the other, a receptacle containing blacking, a blacking-applying pad mounted on the carrier and having an independent movement into and out of the receptacle, and a fixed cam having operative connection with said pad to cause it to dip into the receptacle once during each cycle of movement of the carrier.

12. In a shoe-blacking machine, the combination with a foot-rest, of an endless belt and driving means therefor, a cleaning-brush, a blacking-brush and a polishing-brush all rotatingly mounted on the belt one in advance of the other, a second belt operatively connected with the brushes to rotate said brushes, separate driving means for the second belt, a device located in front of the foot-rest for applying blacking to the periphery of the blacking-brush, and means on the first-named belt operatively connecting with said device to bring it into action after the cleaning-brush has passed and before the polishing-brush reaches said devices.

811,081. **MACHINE FOR MAKING VENEER-STAVE BARRELS.** GEORGE H. BROWN, Norfolk, Va. Filed Oct. 31, 1904. Serial No. 230,511.



Claim.—1. A barrel-machine embodying a fixed concave form provided with clenching-surfaces and adapted to receive hoops and staves, and means for rotating the same within the form independently thereof.

2. A barrel-machine embodying fixed concave hoop-receiving forms provided with clenching-surfaces, and means for supporting the hoops thereon in the same relation to each other as they occupy in a finished barrel.

3. A barrel-machine embodying fixed concave hoop-receiving forms provided with clenching-surfaces, and means for supporting the hoops thereon in the same relation to each other as they occupy in a finished barrel.

4. A barrel-machine embodying a fixed concave form provided with clenching-surfaces and adapted to receive hoops and staves, said form being arranged to permit the hoops and staves to be rotated independently of it.

5. A barrel-machine embodying fixed concave hoop-receiving surfaces, and a movable member provided with means projecting beyond the said surfaces and the hoops for engaging a stave to partially rotate an unfinished barrel.

6. A barrel-machine embodying fixed concave hoop-receiving surfaces, a slide provided with means projecting between the hoop-receiving surfaces for directly engaging the staves to partially rotate an unfinished barrel, and operating mechanism connected with the slide.

7. A barrel-machine embodying fixed concave hoop-receiving surfaces, a slide provided with a plurality of pins projecting beyond the hoop-receiving surfaces and the hoops to engage a stave for partially rotating an unfinished barrel, and means for operating the slide.

8. A barrel-machine embodying fixed concave hoop-receiving surfaces, a movable member provided with means for directly engaging a stave to partially rotate an unfinished barrel, a lever connected with the said member for moving the same in one direction, and automatically-operable means for moving the said member in the opposite direction to return the same to its initial position.

9. A barrel-machine embodying fixed concave hoop-receiving forms, a slide provided with means for directly engaging a stave for partially rotating an unfinished barrel, a foot-lever for moving the slide in one direction, and a weight for moving it in the opposite direction.

10. A barrel-machine embodying fixed concave hoop-receiving surfaces, and superimposed hoop-supports arranged to engage the upper portion of the hoops for retaining them in the same relation to each other as they occupy in a finished barrel.

11. A barrel-machine embodying fixed concave hoop-receiving surfaces, and superimposed hoop-supports arranged to receive the upper portions of the hoops for retaining them on the said surfaces in the same position as they occupy in a finished barrel, the said hoop-supports being resilient to enable them to be flexed by the staves.

12. A barrel-machine having fixed hoop-receiving surfaces and provided with spaced hoop-supporting fingers for holding the hoops in the same relation to each other as they occupy in a finished barrel.

13. A barrel-machine embodying fixed concave hoop-receiving surfaces, and spaced fingers located above the said surfaces for holding the hoops in the same relation to each other as they occupy in a completed barrel, said fingers being inclined to receive hoops of different diameters.

14. A barrel-machine embodying fixed concave hoop-receiving clenching-surfaces, and a superimposed hinged support provided with means for holding the hoops on the said surfaces in the same relation to each other as they occupy in a finished barrel.

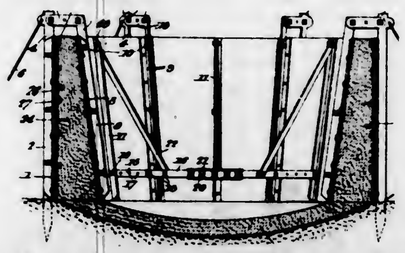
15. A barrel-machine embodying a stand provided with lower fixed concave hoop-receiving surfaces, a hinged frame located above the said surfaces and provided with means for supporting the hoops on the surfaces in the same relation to each other as they occupy in a completed barrel, and end stops projecting from the stand and from the frame and arranged to engage the ends of an unfinished barrel.

16. A barrel-machine, comprising a stand having fixed concave barrel-receiving surfaces and provided with standards arranged in pairs, a frame hinged to one pair of the standards, brackets mounted on the other pair of standards and supporting the frame, and means carried by the frame for supporting the hoops on the surfaces in the same relation to each other as they occupy in a finished barrel.

17. A barrel-machine embodying a frame having fixed concave hoop-receiving surfaces, and a superimposed hoop-engaging roller arranged to receive the upper portion of the hoop for holding the same in position.

18. A barrel-machine embodying a frame having fixed concave hoop-receiving surfaces, means for supporting the hoops on the surfaces in the same relation to each other as they occupy in a finished barrel, and a grooved roller arranged to receive the upper portion of a hoop for holding the same against upward movement.

811,082. **MOLD.** GUSTAV A. BYOR, Edgar, Nebr. Filed May 11, 1905. Serial No. 260,948.



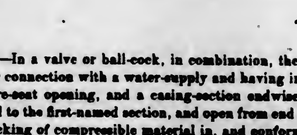
Claim.—1. In a mold of the character described, the combination of inner and outer concentric mold members, posts engaging the members and rising above the tops thereof with their upper ends provided with lapped arms, and fastenings connecting the arms.

2. In a mold of the character described, the combination of inner and outer concentric mold members, the inner member being made up of sections, a centering device within the inner mold member above the bottom thereof, substantially radial braces extending between the centering device and the respective inner mold-sections, and hangers inclined downwardly and inwardly from the inner mold member to the braces and supporting the centering device.

3. In a mold of the character described, the combination of inner and outer concentric mold members, the inner mold member being formed of sections having terminal upright flanges with the flanges of each section connected to the flanges of the adjacent sections, posts secured between each pair of flanges and rising above the top of the mold, and connections between the posts and the outer mold member.

4. In a mold of the character described, the combination of inner and outer concentric mold members, each mold member being made up of flanged sections having the flanges of each section connected to the flanges of the adjacent sections, posts driven into the ground in engagement with the outer face of the outer mold member with their upper ends rising above the top of the mold and provided with arms extending inwardly across the mold members, inner posts secured between the connected flanges of the inner mold member and rising above the top of the mold, each inner post having an arm lapping the arm of the adjacent outer post and secured thereto, a centering device located within the inner mold member and provided with a series of radial seats, radial braces extending inwardly from the inner mold-sections and engaging the respective seats of the centering device, and inclined braces extending downwardly from the inner mold member and connected to the first-mentioned braces.

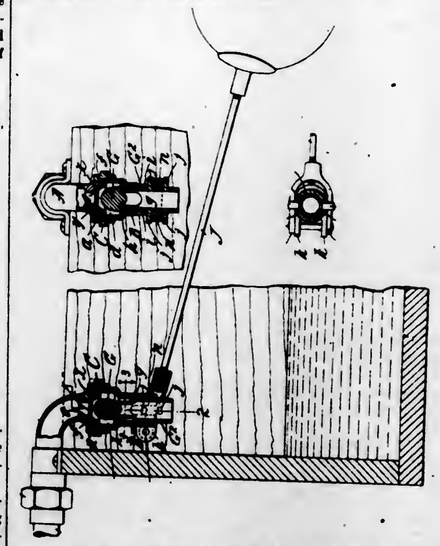
811,033. **PISTOL AND REVOLVER SIGHT.** EMILIO M. CANTO, Santiago, Chile. Filed May 4, 1905. Serial No. 258,917.



Claim.—1. A pistol or revolver provided with a stationary strip forming a sight and extending the full length of the barrel thereof and interrupted intermediate of its length.

2. A pistol or revolver having stationarily mounted upon the upper portion of the barrel thereof a strip forming a sight the same being triangular in cross-section and interrupted intermediate of its length.

811,034. **TANK-VALVE.** DENNIS D. CASEY, Springfield, Mass. Filed July 18, 1904. Serial No. 217,089.



Claim.—In a valve or ball-cock, in combination, the casing A adapted for connection with a water-supply and having in its end a flaring valve-seat opening, and a casing-section endwise adjoined and coupled to the first-named section, and open from end to end, an annular packing of compressible material in, and conformed to the shape of said flaring valve-seat opening having a marginal flange confined between the adjoined end portions of the coupled casing-sections, the primary casing-section being constructed with the annular rib e to serve as a guard for the inner marginal portion of said compressible packing, a tube guided in said secondary section having its upper or rear end portion formed solid and rounded and adapted to fit in said valve-seat opening, having one or more ports,

forwardly of such solid valve-constituting portion, through its tubular wall, and having projections extending through openings in the secondary section, and means engaging said projections for endwise moving the valve-tube.

811,085. ADJUSTABLE WASHER. JOHN H. CHRISTIE, Dobbs Ferry, N. Y. Filed Apr. 26, 1905. Serial No. 257,210.

Claim.—1. An adjustable washer comprising two hollow portions of like bore having outer annular faces at approximately right angles with their bores and of substantial width and having coöperating threads having flat surfaces, and a screw-lock passing through the wall of the outer portion and engageable with the flat face of the thread of the inner portion when said portions are in any of a plurality of relative positions.

2. An adjustable washer comprising two hollow portions of like bore having outer annular faces at approximately right angles with their bores and of substantial width and having coöperating threads, wrench-engaging means on each of said portions, and a locking device for retaining said portions in any of a plurality of adjusted positions.

3. An adjustable washer comprising two hollow portions of like bore having coöperating threads, a locking device for retaining them in any of a plurality of adjusted positions, and a micrometer-scale on their exterior surfaces.

4. An adjustable washer comprising two hollow portions of like bore having coöperating threads, the outer portion having its end face approximately perpendicular to its bore and of substantial width, the inner portion having a collar or exteriorly-extending flange portion, and a locking device for retaining said portion in any of a plurality of adjusted positions.

5. An adjustable washer comprising two hollow portions of like bore having coöperating threads, the outer portion having its end face approximately perpendicular to its bore and of substantial width, the inner portion having a collar or exteriorly-extending flange portion, the exterior diameter of which is approximately equal to that of said outer portion, and a locking device for retaining said portions in any of a plurality of adjusted positions.

6. An adjustable washer comprising two hollow portions of like bore having coöperating threads, the inner portion having a collar or exteriorly-extending flange portion, the exterior diameter of which is approximately equal to that of said inner portion, a micrometer-scale on the adjacent edges of said portions, and a locking device for retaining said portions in any of a plurality of adjusted positions.

7. An adjustable washer comprising two hollow portions of like bore having coöperating threads, the outer portion having its end face approximately perpendicular to its bore and of substantial width, the inner portion having a collar or exteriorly-extending flange portion, wrench-engaging means on said collar, and a locking device for retaining said portions in any of a plurality of adjusted positions.

8. An adjustable washer comprising two hollow portions having outer annular faces at approximately right angles with their bores and of substantial width and having coöperating threads, the outer portion having an interiorly-extending flange, the bore of which is equal to that of the inner portion and the inner portion having an exteriorly-extending flange, and a locking device for retaining said portions in any of a plurality of adjusted positions.

811,086. DECOY. WALTER W. CRAM, Sheldon, Iowa. Filed May 11, 1905. Serial No. 260,573.

Claim.—1. A decoy embodying an anchor and means for securing the anchor within the decoy.

2. A decoy provided with an opening, an anchor and means for securing the anchor within the opening.

3. A decoy provided with a cavity opening externally, an anchor proportioned to form a closure for the cavity, a cord secured to the anchor and means for winding the cord within the decoy.

4. A decoy provided with an aperture within the under side, an anchor proportioned to form a closure for the aperture and to conform substantially to the surface of the decoy, a cord securing the anchor to the decoy and means for adjustably controlling the length of cord between the decoy and the anchor.

5. In a decoy, a winding-reel, an anchor-cord wound upon the reel, a tension elastically engaging the reel and arranged to hold the reel at a predetermined rotary adjustment.

6. In a decoy, a winding-reel, an anchor, a cord wound upon the reel and secured to the anchor, a tension elastically engaging the reel and arranged to retain a predetermined length of cord wound upon the reel.

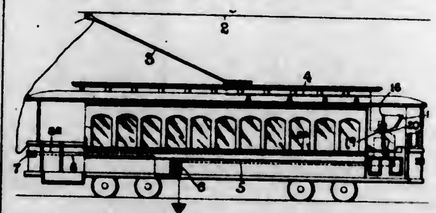
7. A decoy provided with a recess and having a flexibly-connected anchor-weight corresponding in size and shape with said recess so that said anchor-weight may be frictionally contained therein.

8. A decoy provided with a cavity, an anchor-receiving recess and a connecting-passage, a tapered anchor-weight, a flexible connection attached to said anchor-weight and passed through said recess and said passage, and means within said cavity for taking in or paying out said flexible connection.

9. A decoy provided with a cavity, an anchor-receiving recess and a connecting-passage, a tapered anchor-weight, a flexible connection attached to said anchor-weight and passed through said recess and said passage, a spring-actuated winding-drum within said cavity for said flexible connection, a brake-spring for holding said drum against movement and a push-rod for releasing said brake-spring.

10. An anchor-winding device for decoys comprising an outer casing, a push-rod extending therethrough, a spring-actuated winding-drum upon said push-rod, a projection upon one end of said drum, a resilient disk within said casing recessed to form a spring-tongue adapted to be actuated by said push-rod, said tongue being formed with an aperture to receive one of said projections and a coil-spring disposed between said spring-tongue and said casing.

811,087. DANGER-SIGNAL. WILLIAM C. CREVELING, St. Louis, Mo. Filed Dec. 8, 1904. Serial No. 235,975.



Claim.—1. The combination with a car provided with a lamp-circuit, of a storage battery in the car, a storage-battery circuit, a signal, a signal-circuit, a switch for throwing the storage-battery circuit into the lamp-circuit and for including the signal-circuit in the storage-battery circuit, and a separate cut-out for breaking the storage-battery circuit when the switch is in position to include the storage-battery circuit in the lamp-circuit; substantially as described.

2. The combination with a car having a source of electrical energy adapted to be energized through the trolley, of a storage battery, a storage-battery circuit, means for including the storage-battery circuit in the source of electrical energy, a signal-circuit, and means for including the signal in either the source of electrical energy or the storage-battery circuit when the storage-battery circuit is not included in the source of electrical energy; substantially as described.

3. The combination with a car provided with a source of electrical energy, of a storage battery in the car, a storage-battery circuit, a signal-circuit, a switch for throwing the storage-battery circuit into the source of electrical energy, and for including or cutting out the signal-circuit in or from the source of electrical energy, and a separate cut-out for breaking the storage-battery circuit when the switch is in position to include the storage-battery circuit in the source of electrical energy; substantially as described.

4. A danger-signal including an energizing-circuit, a signal-circuit, a storage-battery circuit, a single switch for throwing the energizing-circuit alternately into the signal-circuit and the storage-battery circuit, and a cut-out in one of the circuits; substantially as described.

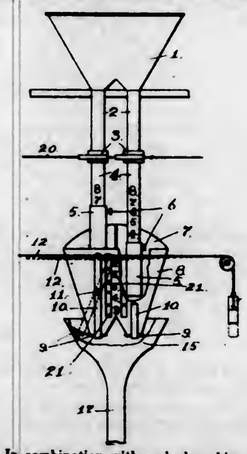
5. A danger-signal including an energizing-circuit, a storage-battery circuit, a signal-circuit, and a switch mechanism for alternately throwing the energizing-circuit in either of the other circuits, said switch mechanism including a lever having an insulated bifurcated end, and a swinging member engaging the bifurcated end of said lever; substantially as described.

6. The combination with a car, of a danger-signal on the car, a signal-circuit, an energizing-circuit, a stationary contact in the path of the signal-circuit, and a swinging contact in the path of the energizing-circuit, said swinging contact being adapted to contact with the stationary contact only when the car is not in motion; substantially as described.

7. A danger-signal including an energizing-circuit, a signal-circuit, a storage-battery circuit, and a single switch for throwing the energizing-circuit alternately into the signal-circuit and the storage-battery circuit, said switch comprising a lever 12 having an insulated bifurcated end, and a pivoted bar having one end in engagement with the bifurcated end of the lever and the other end free to engage a switch-point; substantially as described.

8. The combination with a car having a source of electrical energy and a lamp-circuit in connection therewith, of a storage battery, a storage-battery circuit, a signal-circuit, a switch movable to include the storage-battery circuit in the source of electrical energy, said switch being also movable to a position to include the signal-circuit in the storage-battery circuit and to simultaneously cut out the storage-battery circuit from the source of electrical energy, and a signal in the signal-circuit comprising a casing having a translucent panel, a bell in the casing and included in the circuit, and lamps in the circuit with the bell; substantially as described.

811,088. AUTOMATIC ANIMAL-FEEDER. VAN WYCK A. CROSSIER, San Francisco, Cal. Filed Nov. 26, 1904. Serial No. 234,566.



Claim.—1. In combination with a clock, a bin, a plurality of pipes descending therefrom, valves for opening or closing said pipes, sleeve gages securable over such pipes, a partitioned hopper having openings containing material for seeing the contents, movable slides for opening or closing the base of said hopper and means for the movement of said slides; substantially as described.

2. In combination with a clock, a plurality of pipes, a bin opening therefrom, slide-valves for opening or closing said pipes, sleeve gages securable over such pipes, a plurality of hoppers containing material for seeing the contents thereof, movable slides for opening or closing the bases of said hoppers and means for automatically opening such slides, substantially as described.

3. In combination with a clock a receptacle for grain having openings in its base, pipes descending from such openings, valves for opening or closing such pipes, cylinders movable longitudinally on said pipes, a plurality of hoppers having equidistant openings containing material for seeing the contents thereof, slides covering the open bases of said hoppers, levers and connections thereto for opening said slides, substantially as described.

4. In combination with a clock, a bin having openings in its base, pipes in connection with said bin, valves to open or close said pipes, adjustable sleeves partly covering said pipes, a partitioned hopper having equidistant openings containing material for seeing its contents, levers of unequal length connected to slide to open, or close the base of said hopper and means for the movement of said levers substantially as described.

5. In combination with a clock a bin having openings at its base, pipes leading therefrom, cylinders telescoping on such pipes and securable thereto, a partitioned hopper penetrable by said cylinders, a plurality of levers fulcrumed to said hoppers, slides sustained by said levers and movable laterally, and cords and weights arranged to be released by the clock for the operation of such levers and slides, substantially as described.

6. In combination with a clock, a receptacle for holding grain, said receptacle having orifices for discharging the grain into hoppers beneath the same, means for regulating the amount of grain so discharged, hoppers having translucent openings in their sides for ascertaining the amount of grain therein and said hoppers also having orifices at their bases, slides covering said orifices, and levers and connections for automatically moving said slides for discharging the grain and for closing the same substantially as described.

7. In combination with a clock, a bin and pipes leading therefrom, valves for opening and closing said pipes, cylinders telescoping on such pipes and adjustable thereon, a plurality of hoppers penetrable by said cylinders, slides for opening and closing the open bases of said hoppers, means for operating said slides, and a hopper having a chute leading to a manger, substantially as described.

8. In an automatic animal-feeder the combination of a receptacle for grain having openings at its base, pipes leading from such receptacle, valves for opening and closing such pipes, adjustable sleeves upon such pipes, a plurality of hoppers beneath said sleeves, slides for opening and closing the open bases of said hoppers, levers and connections for the movement of said slides, substantially as described.

9. In an automatic animal-feeder, the combination of a main receptacle opening into pipes leading therefrom, valves in said pipes and means for moving the same, adjustable sleeves upon said pipes, a plurality of hoppers having openings in each penetrable by one of such sleeves, means for automatically opening and for closing the bases of said hoppers, and a receptacle leading from such bases, substantially as described.

811,089. STORM-FRONT FOR VEHICLE-TOPS. CHARLES C. DAUGHERTY, Columbus, Ohio. Filed Dec. 13, 1905. Serial No. 291,968.

Claim.—1. A storm-front for vehicle-tops comprising a middle or front portion and side portions, the upper edge of the middle portion being inelastic at its middle and ends but provided near its ends with elastics and with hooks for engagement with the upper corners of the top.

2. A storm-front for vehicle-tops, comprising a middle or front portion, and side portions, the upper edge of the middle portion being in elastic at its middle and ends but provided near its ends with

elastics and with hooks to engage the upper corners of the vehicle-top and a clip near the middle of the upper edge of the front to engage the valance.

3. A storm-front for vehicle-tops comprising a middle or front portion, and side portions, the upper edge of the middle portion being inelastic at its middle and ends but provided near its ends with elastics and with hooks to engage the upper corners of the vehicle-top, and a light secured in the area below the middle portion of the upper edge of the front.

4. A storm-front for vehicle-tops comprising a middle or front portion, and side portions, the upper edge of the middle portion being inelastic at its middle and ends but provided near its ends with elastics and with hooks to engage the upper corners of the vehicle-top, and a flexible light secured in the area below the middle portion of the upper edge of the front.

5. In combination with the ends of the upper edge of a storm-front, a single-piece hook having a shank at its upper side, an inwardly-bent extension below the hook and a finger-piece on the inwardly-bent extension.

811,040. **SINTERING COMMINUTED ORE OR FLUE-DUST.** GEORGE L. DAVISON, Chicago, Ill., assignor to American Sintering Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 4, 1905. Serial No. 285,941.

Claim.—1. The process of sintering comminuted ore or flue-dust which consists in mixing the ore or flue-dust with a small percentage of comminuted fluor, then passing the mixture gradually through a furnace and heating it until the mixture fuses sufficiently to cohere, and agglomerating the mixture into lumps by agitation while thus in partially-fused condition.

2. The process of sintering comminuted ore or flue-dust which consists in mixing the ore or flue-dust in substantially dry condition with a small percentage of dry or substantially dry comminuted fluor, then passing the mixture gradually through a rotary furnace and heating it to a temperature which causes the mixture to partially fuse and causing the mixture to agglomerate into lumps by tumbling it repeatedly while thus in partially-fused condition.

3. The process of continuously sintering comminuted ore or flue-dust which consists in preparing a mixture of the ore or flue-dust with approximately one per cent. of comminuted fluor, then passing such mixture gradually and continuously in controlled quantities through a furnace and gradually heating it while passing through the furnace to a temperature at which the mixture fuses sufficiently to cohere and effecting an agglomeration of the mixture into lumps by repeated tumbling of the material while in partially-fused condition.

811,041. **CLUTCH.** JOHN R. DONSON, Ypsilanti, Mich., assignor to Michigan Machinery Mnfg. Company, Ypsilanti, Mich., a Corporation of Michigan. Filed June 27, 1904. Serial No. 214,206.

Claim.—1. A clutch comprising a shaft, a pair of separated bearings in which said shaft is journaled and in fixed relation to each other, coöperating clutch members sleeved on said shaft between said bearings, one of said bearings being revoluble and the other longitudinally slidable upon said shaft, a spring between said slidable member and its adjacent bearing, a peripheral cam on said slidable member, and a rock-arm having means rigidly secured thereto for engaging with said cam to cause the longitudinal movement of said slidable member against the tension of said spring and out of engagement with the coöperating clutch member.

2. A clutch comprising a shaft, a pair of separated bearings in which said shaft is journaled, said bearings being in fixed relation to each other, a driven wheel sleeved upon said shaft adjacent to one bearing, a sleeve feathered to said shaft between said driven wheel and the other bearing, coöperating clutch-faces on said sleeve, a driven wheel, a spring between said sleeve and its adjacent bearing for yieldingly pressing the former into engagement with said driven wheel, a peripheral cam on said sleeve, and a gravity rock-arm having means rigidly secured thereto for engaging with said cam to cause the latter to disengage said sleeve from said driven wheel.

3. In a clutch, the combination with the driven wheel of a shaft on which said wheel is journaled, a sleeve feathered to said shaft and together with said driven wheel forming coöperating clutch members, a tension device for moving said sleeve toward said driven wheel, a peripheral cam on said sleeve, and a gravity rock-arm having means rigidly secured thereto for engagement with said peripheral cam to disengage said clutch members.

4. In a clutch, the combination with a revoluble clutch member and a coöperating slidable clutch member, of a peripheral cam on said slidable member, a rock-arm, an antifriction-roll, a bearing for said roll rigidly connected to said rock-arm, whereby the same will rock therewith and engage said cam.

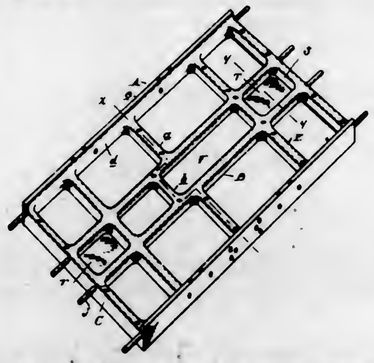
5. In a clutch, the combination with a revoluble clutch member of a coöperating slidable clutch member, a peripheral cam on said slidable member, the rock-arm P, the antifriction-roll M, adjustably secured thereto the journal O having the eccentric shank *f* and clamping means for said shank in different positions of adjustment.

6. The combination of the driving-shaft of the gear-wheel loose thereon and having a toothed hub forming one member of a clutch, of the toothed sleeve feathered to the shaft forming the other member of the clutch, and the ring S′ between the ends of the feathers and the hub of the wheel, and the notches T′ in said ring engaging the end of the feathers or keys, as and for the purpose described.

7. A clutch for presses or the like comprising a frame, a shaft extending outwardly therefrom, a pair of separated bearings in which said shaft is journaled, an upwardly-extended bracket on the frame for the outer bearing, a driven wheel sleeved upon said shaft adjacent the inner bearing, a sleeve feathered to said shaft between said driven wheel and the outer bearing, coöperating clutch-faces on said sleeve and driven wheel, a peripheral cam on said sleeve, and a gravity rock-arm pivoted to the upper end of the said bracket, one end thereof being free and having means rigidly secured thereto for engaging said cam to cause the latter to disengage said sleeve from said driven wheel.

8. A clutch of the character described comprising a driven wheel and a sleeve, a shaft for said wheel and sleeve, coöperating clutch-faces on said sleeve and driven wheel, a peripheral cam on said sleeve and a gravity rock-arm pivoted adjacent one end only to a relatively fixed member, the opposite end of said arm being free to move by gravity and having means connected thereto and movable therewith for engaging said cam to cause the latter to disengage said sleeve from said driven wheel.

811,042. **HAND-CAR FRAME.** JAMES DONOVAN, Three Rivers, Mich., assignor, by mesne assignments, to Sheffield Car Company, Three Rivers, Mich., a Corporation of Michigan. Filed Apr. 10, 1905. Serial No. 254,901.



Claim.—1. In a light car, a frame comprising longitudinal sills and ties, struck from a single sheet of metal.

2. In a light car, a frame comprising side sills, two separated intermediate sills, and connecting-ties, struck from a single sheet of metal.

3. In a light car, a frame comprising inverted channel-sills and ties, struck from a single piece of metal.

4. In a light car, a frame comprising sheet-metal intermediate sills, laterally-extending integral ties and side sills, the ties connecting to the side sills below the top thereof.

5. In a light car, a frame formed of a single sheet of metal and comprising longitudinal intermediate sills, ties and side sills, the ties connecting to the side sills below the top.

6. In a light car, a frame, longitudinal inverted channel-sills, longitudinal stiffening members secured in the channel, and ties connecting the sills.

7. In a light car, a sheet-metal frame comprising inverted channel sills and ties, and tubular stiffening members extending through the channels of the sills.

8. In a light car, a frame comprising inverted channel sills and ties, struck from a single piece of sheet metal, and stiffening tubular members secured in the channels of the sills.

9. In a light car, a frame comprising sills and ties in inverted channel form, struck from a single sheet of metal, stiffening-bars extending through the channels of the sills, and through the sides of the end ties.

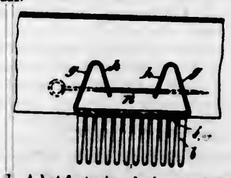
10. In a light car, such as a hand-car, an integral sheet-metal floor-frame having vertical flanges.

11. In a light car, such as a hand-car, a metallic frame comprising integral channel sills and ties.

12. In a light car, such as a hand-car, a metallic frame comprising sills and ties of inverted channels, the side sills projecting above the plane of the top of the frame.

13. In a light car, a frame comprising sills and ties, struck from a single sheet of metal, and sections such as S between the sills and ties having the bottom plate T.

811,043. **HAT-FASTENING DEVICE.** ELOUID DUPLESSIS, Sorel, Canada, assignor of one-third to George Michel Badeau and one-third to Joseph Amédée Therien, Sorel, Canada. Filed Feb. 20, 1905. Serial No. 246,551.



Claim.—1. A hat-fastening device consisting of a resilient carrier adapted to be fastened to the hat and constructed to present a bowed portion, and a pivoted rigid comb-plate carried by such carrier and constructed to present a straight fold or channel inclosing and fitting revolubly and snugly upon the bowed portion of the carrier for the purpose of enabling the comb-plate to be retained by the carrier in different angular positions relatively to such carrier.

2. A hat-fastening device comprising a resilient carrier consisting of a length of wire bent to present a bowed portion and attachment portions, and a rigid comb-plate formed with a straight fold inclosing and fitting revolubly upon the bowed portion of the wire for the purpose of enabling the comb-plate to be retained in different angular positions relative to such carrier.

3. A hat-fastening device consisting of a resilient wire having its main length bowed and the ends thereof bent toward one another and then back toward the bowed portion and formed with depressions near their ends, a rigid comb-plate consisting of a curved comb with the back thereof folded upon itself to present a straight groove inclosing the bowed portion of the carrier, and means whereby said carrier is fastened to a hat.

4. A hat-fastening device consisting of a resilient wire having its main length bowed and the ends thereof bent toward one another and then back toward the bowed portion and formed with depressions near their ends, a rigid comb-plate consisting of a curved comb with the back thereof folded upon itself to present a straight groove inclosing the bowed portion of the carrier, and extended and tapered to provide a thumb-piece, and a hat-pin having its point bent for fastening the device to a hat.

811,044. **PAINT AND VARNISH REMOVER.** CARLETON ELLIS, Montclair, Essex, assignor to Chemical Chemical Company, New York, N. Y., a Corporation of West Virginia. Filed Dec. 10, 1903. Serial No. 184,603.

Claim.—1. As a new article of manufacture, a substantially neutral paint and varnish remover comprising a wax; a solvent for the wax; and a gelatinizer containing about forty per cent. acetone, some methyl alcohol and the balance higher ketones.

2. A paint and varnish remover comprising benzole, methyl acetone and wax.

3. A paint and varnish remover comprising methyl acetone, other paint and varnish solvents, and a wax.

4. A paint and varnish remover, comprising methyl acetone; other paint and varnish solvents; a wax; and a wax solvent.

811,045. **SAFETY-POCKET.** ARCHIBALD M. PITSKER, Atkinson, Ill. Filed Sept. 20, 1905. Serial No. 279,278.

Claim.—The combination with a pocket, of oppositely-disposed spring-strips secured to the mouth of the pocket for holding it closed, and a rubber tube secured to the face of one of said strips.

811,046. **SAFETY-CATCH FOR ELEVATORS.** ANDREW FLESHER, Taylorville, Ill. Filed Sept. 21, 1905. Serial No. 279,476.

Claim.—1. The combination with a mine-shaft having a wood curbing and vertical guides on two opposite sides thereof, of a cage having channeled shoes on two opposite sides, to fit said guides, and safety-catches on the remaining two opposite sides of the cage and extending substantially the width thereof, and adapted to directly engage the shaft-curbing.

2. The combination with a shaft having a curbing and having vertical guides arranged on two opposite sides thereof, of a cage having channeled shoes on two opposite sides adapted to slidably embrace said guides, and safety-catches on the remaining two opposite sides of cage, said catches including oscillatory members extending substantially the width of the cage, and provided with points adapted to embed themselves in the curbing of the shaft, said members being spring-actuated, and means connecting the members with the hauling-cable of the cage, whereby the members are held out of contact with the curbing when the hauling-cable is under tension.

3. The combination with a shaft having a curbing and vertical guides on two opposite sides thereof, of a cage having means slidably engaging said guides, journaled wings extending across substantially the full width of two opposite sides of the cage and provided with points adapted to be embedded in the curbing, means connecting the wings with the hauling-cable, whereby said wings are held out of contact with the curbing and close to the cage, when the hauling-cable is under tension, and springs engaging the wings to automatically project them outwardly when the tension on the hauling-cable is released.

4. The combination with a shaft having vertical guides and a curbing composed of penetrable material, of a cage having means to slidably fit said guides, shafts extending substantially the width of two opposite sides of the cage, said sides being those which are disposed at right angles to the sides which engage the guides, wings journaled on the shafts and provided with penetrating-points adapted to be embedded in the curbing, said wings having crank-arms extending from one end, chains connecting said crank-arms with the hauling-cable whereby the wings are folded close to the cage when the hauling-rope is under tension, and springs coiled on the shafts, each having one end bearing on the cage and the other end bearing under the wing to automatically project the wing into contact with the curbing when the tension is removed from the hauling-cable.

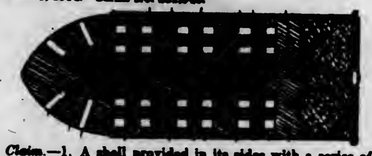
811,047. **FOLDING TRANSPORTATION POULTRY-COOP.** LEWIS D. FOWLER, Oklahoma, Okla., assignor of one-half to Isaac A. Knox, Oklahoma, Okla. Filed Apr. 10, 1905. Serial No. 254,713.

Claim.—1. In a folding transportation poultry-coop, the combination with a floor-base, having inwardly-folding sides and swinging ends hinged thereto, a top moving upward and downward with the ends, and hinged thereto, of a latch consisting of a spring-arm secured to the end of the coop and a shoulder near the end of said

spring-arm adapted to abut against the inner face of the side wall to hold it in the raised position, substantially as described.

2. In a folding transportation poultry-coop, the combination with a rectangular base, a rectangular top, and inwardly-folding sides hinged to the base, of swinging ends hinged to the base and to the top, flanges on the side edges of the end members and spring-latches having shoulders disposed adjacent said flanges, the side walls of the coop being clamped between said flanges and shoulders in the raised position, substantially as described.

811,048. SHELL. ALBERT H. PFIMMER, New York, N. Y. Filed Nov. 8, 1904. Serial No. 231,963.



Claim.—1. A shell provided in its sides with a series of openings and having a passage in communication with each of said openings for setting off the charges therein, and a shell fitted in each of said openings and in turn provided in its sides with openings to receive an explosive and projectiles, substantially as set forth.

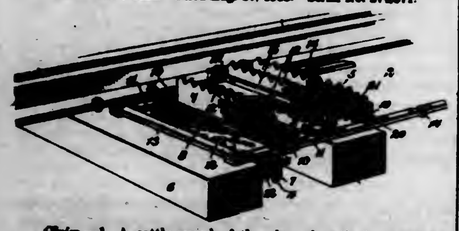
2. A main shell comprising a cylindrical body having a conoidal-shaped end and having openings around the sides of the pointed end disposed at different relative angles and having radial openings in the sides of its body, an explosive and a projectile in each of the openings in the point, and a shell and explosive in each of the side openings, each of the shells being provided with a plurality of openings in each of which is placed an explosive and a projectile, the main shell having a passage in communication with all of the openings and having a slow-burning powder or fuse placed therein.

3. In combination, a casing adapted to receive an explosive, a shell within said casing and having openings in its sides to receive a plurality of projectiles, and means for limiting the movement of the shell with reference to the casing when the explosive is fired, substantially as set forth.

4. In combination, a casing having an extended base and adapted to receive an explosive, a shell arranged within the casing and provided in its sides with a plurality of openings to receive an explosive and projectiles, and means for limiting the movement of the shell within the casing when the explosive is set off.

5. In combination, a casing having a base at one end and an inner flange at the opposite end, an explosive supplied to the casing, and a shell having a series of openings in its side to receive an explosive and a projectile, said shell having an outer rim to engage with the inner rim of the casing and limit the outward movement of the shell, substantially as set forth.

811,049. CATTLE-GUARD. JOHN L. FRIEDMAN and JOHN GRABAR, Lawton, Okla. Filed Aug. 17, 1905. Serial No. 274,571.



Claim.—1. A cattle-guard of the class described, comprising large rotary members spaced apart and arranged between the cross-ties of a track, and small superimposed rotary members located between the large rotary members and arranged above the cross-ties, the tops of the said small rotary members being arranged in substantially the same plane as the tops of the large rotary members.

3. A cattle-guard of the class described, comprising large rotary members operating in the spaces between the cross-ties, and small superimposed rotary members arranged in pairs in spaces between the large rotary members for operation above the cross-ties.

4. A cattle-guard of the class described, comprising a frame secured to the cross-ties of a railroad-track and provided with bearings, large rotary guard members located in the bearings and arranged between the cross-ties, bearing-brackets extending upward from the frame and located above the cross-ties, and small rotary members supported by the bearing-brackets and located between the large rotary members.

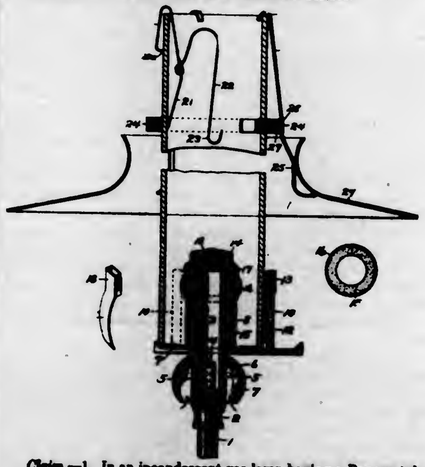
5. A cattle-guard of the class described, comprising a frame having side bars provided with bearings, large rotary members operating between the cross-ties of a railroad-track and mounted in the bearings of the frame, substantially inverted-U-shaped bearing-brackets mounted on the frame between the said bearings and provided at their tops with bearings arranged in pairs, and small rotary guard members arranged in pairs between the large guard members and journaled in the bearings of the brackets.

6. A cattle-guard of the class described, having rotary guard members, each composed of a polygonal shaft having flat faces, and radially-arranged blades extending from the shaft and having their inner edges bent at right angles to form flanges which are secured to the said faces of the shaft.

7. A cattle-guard of the class described composed of a series of rotary members, some of which are mounted on the ties and others of which are located between the ties.

8. A cattle-guard of the class described composed of a series of rotary members, some of which are mounted on the ties and others of which are located between the ties, all of said members having their tops in the same horizontal plane.

811,050. INCANDESCENT GAS-LAMP. LOUIS C. FULLER, Kansas City, Mo. Filed June 9, 1905. Serial No. 264,518.

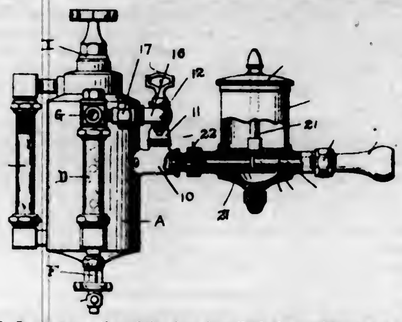


Claim.—1. In an incandescent gas-lamp having a Bunsen tube, an outer tube sleeved thereon and a chimney-holder secured to said outer tube, the combination of a heat-insulating bushing mounted upon said outer tube, and a tip-holder mounted upon said bushing; whereby the heat communicated by the flame to the tip-holder will be insulated from the chimney-holder.

2. In a mantle gas-lamp, a mantle-holder formed of a single piece of wire and comprising a looped hook adapted to engage the upper edge of a chimney, a downwardly-extending leg adapted to bear against the inner side of a chimney, and a depending hook adapted to support a mantle; substantially as described.

811,051. FILLING ATTACHMENT FOR SIGHT-FEED OILERS. FRANK B. GARDNER, Worcester, Mass. Filed Nov. 2, 1901. Renewed June 26, 1905. Serial No. 267,449.

Claim.—1. In a construction of the class described, the combination of a sight-feed oiler, an oil-supply pump, and connections from the oil-supply pump for refilling the sight-feed oiler or for furnishing a supply of oil directly to the outlet of the sight-feed oiler.

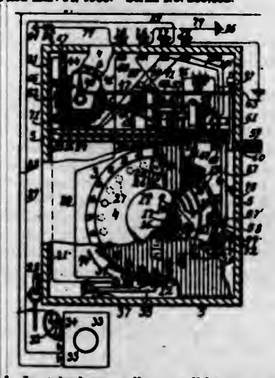


2. In a construction of the class described, the combination of a sight-feed oiler, a supply-pump, and valve-controlled passages for connecting the oil-supply pump to refill the sight-feed oiler or to furnish a direct supply of oil to the part to be lubricated, as desired.

3. In a construction of the class described, the combination of a sight-feed oiler, a pressure-pipe therefor, an oil-supply pump, and valve-controlled passages for connecting the oil-supply pump to refill the sight-feed oiler or to furnish a direct supply of oil to the part to be lubricated, as desired, said parts being combined so that when the pump is operated to refill the sight-feed oiler, the water from the sight-feed oiler will be forced back into the pressure-pipe.

4. In a construction of the class described, the combination of an oiler comprising a body portion, a pressure-pipe leading thereto, a sight-feed passage leading therefrom, and an attachment comprising an oil-reservoir consisting of a base-piece with a pump-cylinder therein, a glass body portion secured on the base-piece, a hand-operated pump-piston mounted in the pump-cylinder, and two valve-controlled passages leading from said pump's cylinder, one passage being connected to refill the body portion of the oiler, and the other passage being connected to furnish a direct supply of oil when it is not desired to have the same pass through the sight-feed passage of the oiler.

811,052. TELEPHONE-CALL. PETER T. GEYERMAN, Brewster, Minn. Filed Nov. 14, 1905. Serial No. 287,082.



Claim.—1. In telephone-calls, a call-box; a ratchet-wheel mounted on a shaft journaled in the box, and a stop-pin projecting from the wheel; a plate located parallel with one face of the wheel and having a circle of holes through it corresponding in number to the number of teeth on the wheel; a knob having a pointer and fixed to a hollow shaft which is mounted to rotate and to slide longitudinally on the aforesaid shaft; a crank-arm having a grooved hub and fixed to the hollow shaft and carrying a pin which is fitted to pass through any one of the said holes in the plate into the path of the pin on the wheel; a normally closed selecting-circuit connecting a number of these call-boxes; a selecting device in each circuit; means for revolving the said wheel and means whereby the wheel breaks the said circuit at the passage of each tooth in revolving.

2. In telephone-calls, a call-box; a ratchet-wheel therein carrying a stop-pin; means for revolving the wheel and means actuated by the wheel to operate selecting mechanism; a plate located adjacent to one face of the said wheel and having a series of holes through it; a knob and pointer, and a dial for the pointer outside of the box, and a stopping-pin connected with the knob and fitted to engage any one of the holes in the said plate.

3. In telephone-calls, a call-box; a ratchet-wheel therein carrying a stop-pin; a stopping-pin mounted on an arm having a grooved hub and connected with an operating-knob, and a shifter comprising a rock-shaft, an arm therefrom engaging the said grooved hub; another arm thereof and a wire adapted to engage the receiver-support of a telephone.

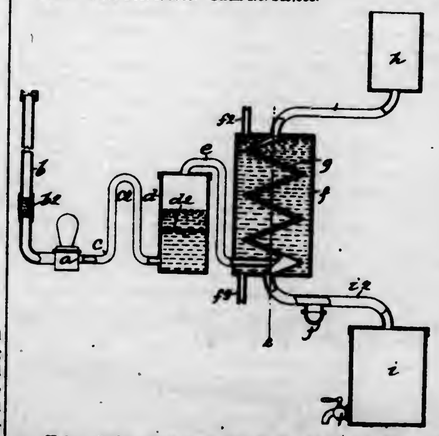
4. In telephone-calls, a call-box; a ratchet-wheel and drum and means for revolving the same in the box; the drum having in it a stop-notch the rear wall of which is inclined wedge-like to the circle of revolution; a lever having a hook on one arm to engage the said notch; a pair of contact-springs adjacent to the other arm of the lever, and an open-call circuit connected with the springs, the opening of the circuit being between the springs; a push-pin passing through the side of the box, and a bar hung between the push-pin and lever.

5. In telephone-calls, a call-box; a ratchet-wheel and drum in the box; the drum having a stop-notch in it, the rear wall of which is inclined to the circle of revolution; a lever having at one end a hook to engage the said notch; the normally open springs of a calling-circuit one of which springs is located in the path of the other end of the said lever; means for pushing the lever enough to bring the hook up to the incline but not enough to close the springs, and means for revolving the drum whereby the lever is actuated to close the said springs.

6. In telephone-calls, a shaft journaled in a box and carrying a ratchet-wheel and a wheel with a single notch in it; a spring around the shaft and connected at one end therewith and at the other end with the ratchet-wheel; a pawl for the single-notched wheel; a crank fixed to the shaft; a latch substantially as described pivoted in the box to engage the crank and a pin in a fixture of the ratchet-wheel to engage the latch.

7. In telephone-calls, a normally closed selecting-circuit including a contact-spring; a rotary shaft; step-by-step selecting mechanism operating the said shaft; a wheel upon the shaft carrying a stop-pin; a lever carrying a stopping-pin and pivoted to a fixture; and a push-pin connected with the said lever and adapted to engage the said spring to break its contact substantially as described.

811,053. APPARATUS FOR AERATING, PURIFYING, AND COOLING MILK. DEXTER M. GIFFORD and JAMES HALL, Brooklyn, N. Y. Filed Feb. 1, 1905. Serial No. 243,693.

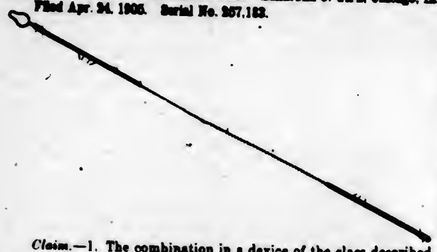


Claim.—1. In an apparatus for treating milk in the manner described, a closed cooler-tank provided with an inclosed zigzag passage which extends therethrough, a water-tank arranged adjacent to the cooler-tank and the top portion of which is in communication with one end of said passage, an air-pump in communication with

the bottom of the water-tank and an air-supply tube in communication with said pump, substantially as shown and described.

2. In an apparatus for treating milk in the manner described, a closed cooler-tank provided with an inclosed zigzag passage which extends therethrough, a water-tank arranged adjacent to the cooler-tank and the top portion of which is in communication with one end of said passage, an air-pump in communication with the bottom of the water-tank and an air-supply tube in communication with said pump, said air-supply tube being also provided with means for purifying air, substantially as shown and described.

811,054. **EXTENSIBLE CHAIN.** EMANUEL C. GIPP, Chicago, Ill. Filed Apr. 24, 1905. Serial No. 257,183.



Claim.—1. The combination in a device of the class described, of a spirally-coiled spring-wire, means within the coil thereof for limiting its extension, end tubes, one of which is rigidly attached to one and the other to the opposite end of said coil, and a series of non-telescoping disconnected tubes slidably mounted upon said coil between said end tubes, whereby when any two of said tubes are grasped and pulled apart, the members of each separated group may be caused to abut successively against each other and in turn against the end tube, thus transferring the pull to the ends of the coil and insuring uniformity of stretch throughout the length of the latter.

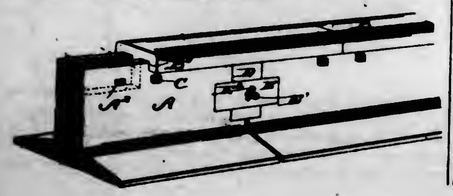
2. The combination with a spiral coil of spring-wire, of overlapping limiting-wires inclosed therein, said wires being provided with end hooks whereby one wire may be attached to one and the other to the opposite end of said coil, means for locking said hooks in position, and means for slidably connecting the overlapping portions of said wires whereby they may slide upon each other within predetermined limits.

3. The combination with a spiral coil of spring-wire, of overlapping limiting-wires inclosed therein, said wires being provided with end hooks whereby one wire may be attached to one and the other to the opposite end of said coil, caps for securing said hooks in position, means for permanently securing said caps to said coil, and means for slidably connecting said wires to limit the movement thereof in opposite directions.

4. The combination with a spiral coil of spring-wire, of overlapping limiting-wires provided with end hooks whereby one wire may be attached to one and the other to the opposite end of said coil, caps for securing said hooks in position, means for permanently securing said caps to said coil, means for slidably connecting the overlapping portions of said wires to limit their opposite movement, and a series of disconnected tubes surrounding said coil between said caps.

5. The combination with a spiral coil of spring-wire, of overlapping limiting-wires inclosed therein, said wires being provided with end hooks whereby one wire may be attached to one and the other to the opposite end of said coil, means for slidably connecting the overlapping portions of said wires to limit their endwise movement, end loops having their bodies projected within the ends of said coil, offsets upon said bodies and tubes surrounding said ends, said tubes being crimped upon said coil and offsets for locking said end loops in position.

811,055. **RAILROAD-RAIL.** CONRAD F. GRAFF, St. Louis, Mo. Filed May 3, 1905. Serial No. 259,204.

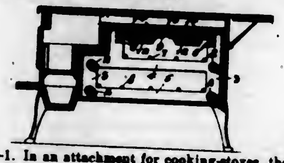


Claim.—1. A rail comprising overlapping tread and base sections, the base-sections being cut out at the ends and recessed on the sides, a block fitting said cut-out portions and recessed on the sides, plates fitting said recesses, each plate overlapping the block, and means for locking the plates in position.

2. A rail comprising a tread having a depending web, a base longitudinally grooved to receive the web, said base being recessed on each side adjacent the ends, a block adapted to fit between two base-sections, and recessed on the sides, said block being bifurcated to straddle the web, and tie-plates fitting in the recesses of the bases and block.

3. A rail of the kind described comprising a tread portion having a depending web and depending side flanges, a base cut away at each end and grooved to receive the web, said base and tread having alining perforations, a bolt adapted to pass through said perforations, a block adapted to fit in the cut-out portions of adjoining bases, said block and bases having alining recesses, a tie-plate adapted to fit said recesses and having an integral pin adapted to pass through the block, an opposing tie-plate perforated for the passage of the pin, and means for locking the pin in place.

811,056. **COOKING-STOVE ATTACHMENT.** GEORGE F. GREEN, Bonita, Tex., assignor of one-half to Ernest S. Jones, Kerens, Tex. Filed Mar. 6, 1905. Serial No. 248,610.



Claim.—1. In an attachment for cooking-stoves, the combination with a series of supporting-frames secured together adapted to be inserted into an oven and having supporting notches or recesses in their upper sides, of open wire shelves or racks supported by said frames, a fender-plate adapted to engage the supporting notches or recesses in the upper ends of said frames whereby said plate is adjustably supported above said racks, and water-pans connected to the under side of said plate, substantially as described.

2. In an attachment for cooking-stoves, the combination with a series of supporting-frames secured together adapted to be inserted into an oven and having supporting notches or recesses in their upper sides, of open wire shelves or racks supported by said frames, a fender-plate adapted to engage the supporting notches or recesses in the upper ends of said frames whereby said plate is adjustably supported above said racks, water-pans connected to the under side of said plate, said pans being cut away at their upper side edges to form discharge-openings through which the water in said pans evaporates, and means whereby said pans may be filled, substantially as described.

3. In an attachment of the character described, the combination with a series of open supporting-frames, spaced apart and held together by means of shouldered bolts and clamping-nuts and having supporting notches or recesses in their upper sides, of upper and lower pan-racks each formed of a single piece of wire bent to form an open shelf having right-angularly-bent ends to engage the outer supporting-frames, a suitably-braced sheet-metal fender-plate adapted to engage one pair of the said supporting-notches formed in the upper ends of each of said supporting-frames, whereby said plate may be supported at different levels above said pan-shelves, and water-pans connected to the under side of said fender-plate, substantially as described.

811,057. **ELECTRIC SIGN.** CARL HALLER, Chicago, Ill. Filed Apr. 29, 1905. Serial No. 257,961.

Claim.—1. An electric sign comprising lamp-sockets, a plate whereto they are attached, said plate being apertured at intervals and said sockets substantially filling said apertures; and a sign-letter open back and front and secured to the front of said plate and laterally inclosing said sockets, said letter consisting of a strip of sheet metal continuous from top to bottom and running peripherally of the letter-outline.

2. An electric sign comprising a plate; a letter-outline shell consisting of a continuous strip of metal running along and forming the outline of the letter, the strip being secured at the rear edge to the front of said plate, and said letter-outline being open back and front; and lamp-sockets secured to said plate within the boundary of the letter-outline substantially as described.

3. An electric sign comprising a foundation-plate, electric-lamp bulbs secured thereto in front thereof, and a letter-outline shell open back and front and secured to said foundation-plate for laterally inclosing said lamp-bulbs, said bulbs being thereby adapted to illuminate the inner surfaces of said shells and such portion of the back plate as is inclosed within the same, and the letter-outline shell consisting of a strip of metal continuous from top to bottom and running peripherally around the letter-outline.

4. In combination, sockets for electric-lamp bulbs; a plate whereto said sockets are affixed, said plate being apertured at the point of attachment of the sockets and being otherwise imperforate and the sockets being approximately coextensive with the apertures in said plate and the major portion of the socket lying behind said plate; and a sign-letter open back and front and secured to the front of said plate, said sign-letter consisting of a strip of sheet metal continuous from top to bottom and running peripherally around the letter-outline, the said sockets being located within said letter-outline.

5. In an electric sign the combination of a foundation-plate, letter-outline shells consisting of strips of sheet metal bent to letter-outline, the rear edge of each strip being bent to form a flange for attachment to said foundation-plate and the front edge of the strip being beaded over for stiffness; and lamp-sockets secured to said foundation-plate within the letter-shells, the major portion of said sockets lying behind said plate.

6. In an electric sign the combination of a foundation-plate, letter-outline shells consisting of strips of sheet metal bent to letter-outline, the rear edge of each strip being bent to form a flange for attachment to said foundation-plate, and the front edge of the strip being beaded over for stiffness; lamp-sockets secured to said foundation-plate within the letter-shells, the major portion of said sockets lying behind said plate; and a back plate fastened a slight distance behind said foundation-plate for housing said lamp-sockets.

811,058. **ELECTRIC SIGN.** CARL HALLER, Chicago, Ill. Filed Apr. 29, 1905. Serial No. 257,962.

Claim.—1. In an electric sign, the combination of a sheet-metal shell forming the outline of a letter, and a diaphragm extending from wall to wall of the shell, said shell having a ridge formed therein between the front and back edges thereof for supporting said diaphragm substantially as described.

2. In an electric sign, the combination of a sheet-metal shell forming the outline of the letter and having an inwardly-projecting ridge formed between the front and back edges thereof; an apertured diaphragm adapted to rest against said ridge; and lamp-sockets secured within said shell back of said diaphragm.

3. In an electric sign, the combination of a sheet-metal shell forming the outline of the letter and having an inwardly-projecting ridge formed between the front and back edges thereof, the walls of the letter-shell being formed of a continuous sheet of metal bent to proper form; an apertured diaphragm adapted to rest against said ridge; and lamp-sockets secured within said shell back of said diaphragm.

4. In an electric sign, a one-piece sheet-metal letter-outline shell having a ridge formed therein and stiffened in front by a beading formed therein; in combination with lamp-sockets, and a diaphragm adapted to fit within the shell against the said ridge and substantially cover said sockets.

5. In electric sign, the combination of a sheet-metal shell forming the outline of the letter, and having an inwardly-projecting ridge formed between the front and back edges thereof, the walls of the letter-shell being formed of a continuous sheet of metal bent to proper form and having a stiffening-beading formed integral therewith at the front edge thereof; an apertured diaphragm adapted to rest against said ridge; and lamp-sockets secured within said shell back of said diaphragm, substantially as described.

6. In an electric sign, the combination of a sheet metal forming the outline of the letter and having an inwardly-projecting ridge formed between the front and back edges thereof; an apertured diaphragm adapted to rest against said ridge; lamp-sockets secured within said shell back of said diaphragm; and a back plate secured to the rear edges of the shell for housing said sockets.

7. In an electric sign, the combination of a sheet-metal shell forming the outline of the letter, and having an inwardly-projecting ridge formed between the front and back edges thereof; a diaphragm adapted to rest against said ridge; a back plate; and lamp-sockets mounted on said back plate, the walls of the shell having marginal flanges formed integral therewith at the rear edge thereof for the attachment of said back plate, and said diaphragm having apertures for the penetration of the lamps or sockets.

811,059. **ELECTRIC SIGN.** CARL HALLER, Chicago, Ill. Filed Apr. 29, 1905. Serial No. 257,963.

Claim.—1. In an electric sign, the combination with lamp-sockets, of a sheet-metal shell forming the outline of a letter and having a ridge formed between its front and rear edges; and a diaphragm adapted to fit within said shell and lie against the said ridge therein and carry said lamp-sockets.

2. In an electric sign the combination with a diaphragm and lamp-sockets mounted thereon, of a letter-shell formed of sheet metal of a single continuous piece from the front to the rear edges; and a ridge impressed from the metal of the shell for supporting said diaphragm.

3. In an electric sign, the combination with a diaphragm and lamp-sockets mounted thereon, of an open-front letter-shell formed of a strip of sheet metal bent into the form of a letter-outline and having a ridge formed therein between the front and rear edges for supporting said diaphragm.

4. In an electric sign, the combination with a diaphragm and lamp-sockets mounted thereon, of an open-front letter-shell formed of a strip of sheet metal bent into the form of a letter-outline and having a ridge formed therein between the front and rear edges for supporting said diaphragm, said sheet being of a single continuous piece from the front to the rear edge thereof.

5. In an electric sign, the combination with a diaphragm and lamp-sockets mounted thereon of an open-front letter-shell formed of a strip of sheet metal bent into the form of a letter-outline and having a ridge formed therein between the front and rear edges for supporting said diaphragm, said shell having a beading at the front for stiffening it.

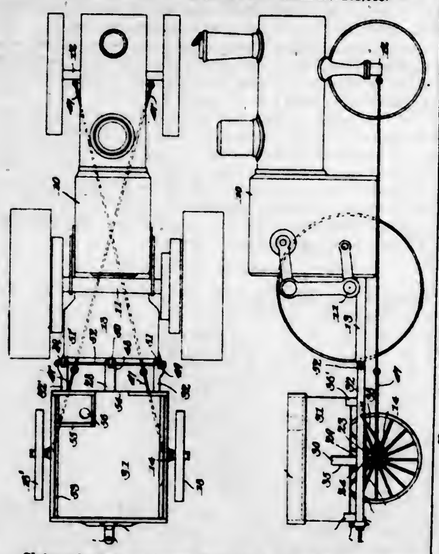
6. In an electric sign, the combination with lamp-sockets, of a sheet-metal shell forming the outline of a letter and having a ridge formed between its front and rear edges; and a diaphragm adapted to fit within said shell and lie against the said ridge therein and carry said lamp-sockets; said sockets lying chiefly on the rear side of the diaphragm for the purpose described.

7. In an electric sign, the combination with a diaphragm and lamp-sockets mounted thereon of an open-front letter-shell formed of a strip of sheet metal bent into the form of a letter-outline and having a ridge formed therein between the front and rear edges for supporting said diaphragm, and a back plate secured to the rear edge of the letter-shell whereby a chamber is formed behind the diaphragm for containing said sockets and their wiring connections.

8. In an electric sign, the combination with a diaphragm and lamp-sockets mounted thereon and lying chiefly on the rear side thereof, of an open-front letter-shell consisting of sheet metal formed of a

continuous piece from front to rear and having a ridge impressed therein between the front and rear edges of the shell for retaining the diaphragm, said shell having narrow marginal flanges formed at the rear edges thereof; and a back plate secured to said flanges substantially as described.

811,060. TRACTION-ENGINE TENDER. HERMAN HAMANN, Beavercreek, Minn. Filed Aug. 24, 1905. Serial No. 275,060.



Claim.—1. In a traction-engine tender, a wheeled axle, a saddle carried above and upon the axle, a semicylindrical tank mounted and carried intermediate its ends upon and in the saddle, curved supports spaced upon each side of the saddle and conforming to the convexity of the tank and frame-pieces carried upon the axle and supporting the curved supports.

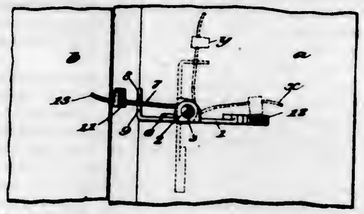
3. In a traction-engine tender, a wheeled axle, a draw-bar, a saddle carried above and upon the axle and disposed in a plane parallel therewith, a semicylindrical tank mounted and carried intermediate its ends upon and in the saddle, frame-pieces extending transversely of the axle and upon each side of and parallel with the draw-bar and curved supports under each end of and conforming to the convexity of the tank and carried upon the frame-pieces and draw-bar.

3. In a traction-engine tender, a wheeled axle, a draw-bar extending transversely of the axle, frame-pieces spaced upon opposite sides of parallel to and connected with the draw-bar, rollers journaled upon the axle and supporting the frame-pieces, a saddle carried above the axle and upon the draw-bar and frame-pieces, a semicylindrical tank mounted and carried intermediate its ends upon and in the saddle and curved supports under each end of and conforming to the convexity of the tank and carried upon the draw-bar and frame-pieces.

4. In a traction-engine tender, a wheeled axle, a draw-bar pivoted upon the axle midway of its ends, a keeper attached to the draw-bar and pivoted to the under side of the axle, rollers journaled upon the axle adjacent the wheels, frame-pieces disposed parallel with and secured to the draw-bar and carried upon the rollers, a saddle disposed over and in a plane parallel with the axle and upon the draw-bar and frame-pieces, and curved supports under each end of and conforming to the convexity of the tank and carried upon the draw-bar and frame-pieces.

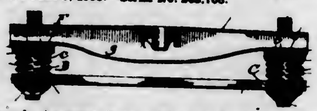
811,061. ALARM. GEORGE A. HILL, Chicago, Ill. Filed Oct. 26, 1904. Serial No. 230,022.

Claim.—1. In an alarm device, the combination of a frame having oppositely-arranged perforated lugs and provided at one end with a detent and at its opposite end with a contact, a pivot-screw passed through the lugs and provided with a projecting threaded end portion, a spring coiled on the pivot-screw between the lugs with an end portion engaged with the frame and with an arm provided with a holder for receiving a cap, said arm having an extended portion for engagement by a door or window when opened and being adapted for engagement by the detent to hold the spring under tension, and being also adapted, when released from said detent, for pivotal movement to strike the cap upon said contact.



2. In an alarm device, the combination of a frame having oppositely-arranged lugs and provided at one end with a detent and at its opposite end with a contact, a pivot part passed through the lugs, a spring coiled on the pivot part between the lugs with an end portion engaged with the frame and an arm provided with a holder to receive a cap, said arm having an extended portion for engagement by a window-sash when moved and being adapted for engagement by the detent to hold the spring under tension and being also adapted, when released from the detent, for pivotal movement to strike the cap upon the contact and an auxiliary pivot-screw passed through the frame for engagement with a window-casing and whereon said frame is adapted to be swung in or out of position for operation.

811,062. RAILWAY-CAR TRUCK. JAMES M. HOPKINS, Chicago, Ill. Filed June 5, 1905. Serial No. 263,706.



Claim.—1. A car-truck comprising side frames having openings therein, spring-planks with springs thereon, spring-caps interlocked with said side frames and an integral bolster projecting through the openings of the side frames and having its ends flanged or offset to engage said spring-caps.

2. A car-truck comprising side frames having openings therein, spring-planks with springs thereon, spring-caps interlocked with said side frames and an integral bolster projecting through the openings of the side frames and having its ends provided with downwardly-projecting flanges engaging said spring-caps.

3. A car-truck comprising metal side frames having openings therein, the portions of said side frames surrounding said openings being formed integral, spring-planks with springs thereon, spring-caps interlocked with said side frames and an integral bolster projecting through the openings of the side frames and having its ends provided with downwardly-projecting flanges engaging said spring-caps.

811,063. ANNUNCIATOR. WALTER R. HOBBINS, Cleveland, Ohio, assignor to The Williams Telephone & Supply Company, Cleveland, Ohio, a Corporation of West Virginia. Filed Dec. 5, 1904. Serial No. 235,617.

Claim.—1. In an annunciator, the combination of a pivoted shutter, a vibratory retaining and releasing device for said shutter comprising a pair of forks adapted in one position of said device to permit the passage therebetween of the adjacent portion of the shutter and in another position to engage such portion of the shutter, and means for vibrating said device, substantially as specified.

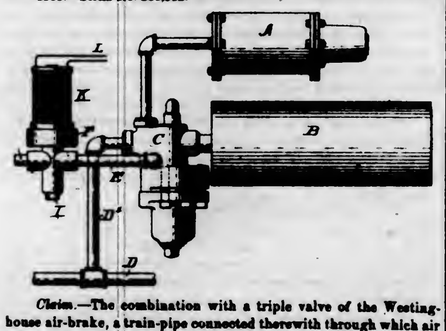
2. In an annunciator, the combination of a pivoted shutter, a vibratory releasing and retaining device for said shutter comprising a pair of forks adapted in one position of said device to permit the passage therebetween of the adjacent portion of the shutter and in another position to engage such portion of the shutter, each of said forks being inclined from the outer extremity thereof toward the body of the device and such inclined surface being beveled, and means for vibrating said device, substantially as specified.

3. In an annunciator, the combination of a pivoted shutter having a rounded portion provided with a beveled edge, a vibratory retaining and releasing device for said shutter comprising a pair of forks positioned and adapted in one position of the device to permit the passage therebetween of the rounded portion of said shutter and in another position to engage such portion of the shutter, each of said forks being inclined from the outer extremity thereof toward the body of the device and such inclined surface being beveled, and means for vibrating such device, substantially as specified.

4. In combination with the hammer-stem of a polarized ringer, an indicator for use therewith comprising a base-plate, a shutter pivoted adjacent to said base-plate with a tendency to move away therefrom, a retaining and releasing device for said shutter, said device being pivoted and having at one end means engaging said stem and at the other end a pair of forks arranged to permit the passage of the shutter therebetween when the stem is vibrating and to retain said shutter when said stem is not vibrating, substantially as specified.

5. The combination of a bell, a hammer, a stem for said hammer, an indicating device for said bell, said device comprising a base-plate having a lower plane portion adapted to be secured to a suitable support and an upper plane portion offset from said lower plane portion, a pivoted shutter adapted to be folded up into vertical position with its outer surface substantially in the plane of the upper portion of said base-plate and having a tendency to fall away therefrom, a member pivoted to the upper portion of said base-plate and having a portion connected with the hammer-stem and a portion adapted to engage the outer surface of said shutter when the stem is at rest and to disengage said surface when the stem is in an intermediate position, substantially as specified.

811,064. AIR-BRAKE. EDWIN T. HUGHES, Gladstone, Colo., assignor of one-fourth to Vincent J. O'Brien, one-fourth to Willis E. Kinney, and one-fourth to James M. Ragan, Silverton, Colo. Filed Oct. 9, 1905. Serial No. 281,912.

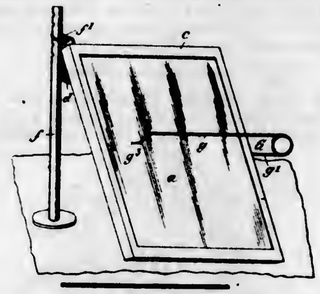


Claim.—The combination with a triple valve of the Westinghouse air-brake, a train-pipe connected therewith through which air is supplied to the triple valve and in which the pressure is at times reduced and which is the sole means for establishing and cutting off communication between the auxiliary reservoir and the brake-cylinder; an exhaust-passage leading from the said triple valve; a valve-casing applied thereto, a valve for opening and closing said exhaust-passage without in any way affecting the passage between the auxiliary reservoir and brake-cylinder, and electromagnetic devices for operating said exhaust-valve.

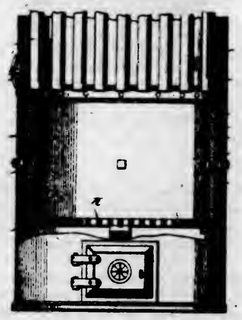
811,065. COPYING APPARATUS. FERDINAND JAGERS, New York, N. Y. Filed Nov. 4, 1905. Serial No. 285,882.

Claim.—1. In a copying apparatus, a mirror, a slate at the back thereof, and a surrounding frame, combined with a U-shaped tracer adapted to straddle the frame and to simultaneously engage the mirror and slate, substantially as specified.

2. In a copying apparatus, a mirror, a slate at the back thereof, and a surrounding frame, combined with a U-shaped tracer composed of a front arm having a tracing-point, a rear arm having a pencil-holder, and an integral connecting coiled spring, substantially as specified.



811,066. STEAM-BOILER. MYER JANOWITZ, Sioux City, Iowa, assignor to Rose Janowitz, Sioux City, Iowa. Filed May 25, 1905. Serial No. 263,233.



Claim.—In an upright-flue boiler, the combination with an outer shell extended below the lower flue-sheet and around the fire-box, of a fire-pot within said shell and spaced at all points therefrom, comprising a cast-iron lining and a backing of non-heat-conducting material.

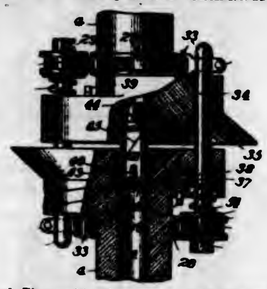
811,067. CORN-HUSKER. MARTIN M. JOHNSON and EDWARD G. JOHNSON, Malta, Ill. Filed Apr. 28, 1905. Serial No. 257,891.

Claim.—1. A corn-husker, comprising a flexible band, means for securing the band around the hand and wrist, and a plate consisting of a substantially oblong body portion having its front end extended laterally at one side and provided in rear of such extension with a laterally-projecting tongue, the front half of the plate being also curved longitudinally to fit the hand, and the rear half of the plate being substantially straight in longitudinal section to form a solid wrist-protecting portion, and being extended from a point below to a point above the wrist-joint to prevent the wrist from bending thereat.

2. In a corn-husker, the combination of a plate provided with perforations, a hook provided at one side of its shank with an integral projecting lug adapted to fit in a perforation of the plate, said shank being also provided with a threaded perforation, and a screw extending through a perforation of the plate and engaging the perforation of the shank.

3. In a corn-husker, the combination of a plate having a plurality of perforations, a hook provided with a lug arranged to engage the perforation, said hook being also provided with a threaded opening, a screw extending through the plate from the inner face thereof and engaging the threaded perforation of the hook, and a flexible lining covering the inner face of the plate and provided with a slit adapted to afford access to the screw.

811,068. COUPLING APPARATUS FOR CARS. GEORGE B. KELLY, Dorrancetown, Pa., assignor of one-half to Joel M. Arnold, Wilkesbarre, Pa. Filed July 19, 1904. Serial No. 217,213.



Claim.—1. The combination with a car, of braking means mounted thereon, a second car, and a hose-coupling between said cars adapted to be connected and disconnected, and including means whereby the braking means is operated upon the parting of said cars when said coupling has not been disconnected, said brake-controlling means of the coupling being inoperative upon said parting if said coupler has been disconnected, substantially as described.

2. The combination with a car, of brakes thereon, a second car, a hose-coupling between said cars and means whereby the draft upon said coupling operates to apply said brakes, substantially as described.

3. The combination with a car, of braking means mounted thereon, a second car, a draft-coupling between said cars, and a hose-coupling between said cars, including means whereby said brakes are applied upon a draft between said cars when said draft-coupler is disconnected and said hose-coupling has not been disconnected, said braking means remaining inoperative if the hose-coupler has been disconnected, substantially as described.

4. The combination with a car, of braking means mounted thereon, a second car, a draft-coupling between said cars, a hose-coupling between said cars, means whereby said brakes are applied upon a draft between said cars when said draft-coupler is disconnected and when said hose-coupling has not been disconnected, said braking means remaining inoperative if said hose-coupler has been disconnected, and common means for disconnecting said couplings, substantially as described.

5. The combination with a car, of a longitudinally-movable coupler-section thereon, and means for adjusting the longitudinal position of said coupler-section, substantially as described.

6. The combination with a car, of an adjustable bracket supported thereon, and a coupler-section spring-supported at a plurality of longitudinally-displaced points by said bracket, substantially as described.

7. The combination with a car, of an adjustable bracket supported thereby, and a coupler-section pivoted to said bracket and spring-supported at a plurality of longitudinally-displaced points, substantially as described.

8. In a hose-coupler having two sections, the combination with a pin secured to each section, means in each section for latching the pin of the other section, and common means for releasing both of said pins from said latching means, substantially as described.

9. In a hose-coupler section, the combination with a pin, of a latch for securing a pin from the opposing section of the coupler, means for moving said latch, and means operatively related to said means for turning said pin, substantially as described.

10. In a hose-coupler the combination with a pin projecting from one section, of a latch in the other section adapted to secure said pin against pull, and means operated by the draft upon the coupler for releasing said pin, substantially as described.

11. In a hose-coupler, the combination with a pin projecting from one section, of means in the other section for securing said pin, camming means whereby draft upon said pin operates to turn and thereby release said pin, and a spring tending to force said pin in the opposite direction, substantially as described.

12. The combination with a car, of a train-pipe thereon for controlling the brakes, a valve controlling said train-pipe, a coupler-section comprising a projecting pin at one side of the passage through said coupler-section and means whereby said pin controls said valve, substantially as described.

13. The combination with a car provided with fluid-pressure brake devices, of a coupler-section connected with the car and having formed therein a passage extending from a pressure-duct of the brake mechanism through one face of said coupler-section, a valve arranged within and adapted to normally close said passage and provided with a projecting pin or stud, and means for automatically applying pressure to the pin of the corresponding valve of a similar coupler-section when said sections are accidentally disengaged substantially as and for the purpose described.

14. The combination with a car provided with fluid-pressure brake devices, of a coupler-section mounted on the car and provided with ducts communicating with the pressure-ducts of the brake devices, valves arranged within said ducts of the coupler-section and adapted to be automatically opened when said section is engaged by a similar section, said coupler-section having a passage adapted to connect one of the pressure-ducts therein with the atmosphere, and a valve controlling said passage and adapted to be operated from the exterior of the coupler, substantially as and for the purpose described.

15. The combination with two cars each provided with fluid-pressure brake devices, of a coupling between said cars comprising a section mounted on each car and provided with ducts adapted to form part of the brake devices, means for automatically connecting the ducts of one section of the coupler with the corresponding ducts in the other coupler-section as said sections are engaged, each of said coupler-sections having a passage adapted to connect one of said pressure-ducts with the atmosphere, a valve controlling each of said passages, and means for automatically actuating said valve when the coupler-sections are unintentionally disengaged, substantially as and for the purpose described.

16. The combination with a car provided with fluid-pressure brake devices, of a coupler-section having therein ducts forming part of the brake devices, and provided with a passage adapted to connect one of said ducts with the atmosphere, a valve controlling said passage, and means on the coupler-section for engaging a similar section on another car, said means being adapted to automatically actuate said valve when unintentionally disengaged from said second coupler-section, substantially as and for the purpose described.

17. The combination with a car, of a brake train-pipe thereon, a valve controlling said train-pipe, a coupler-section comprising a projecting pin, means whereby the draft upon said coupler-section operates to release said pin and means whereby the draft upon said pin operates to actuate said valve, substantially as described.

18. The combination with a car, of brakes thereon, a second car, a hose-coupler between said cars comprising sections adapted to be connected together and means whereby draft on said coupler operates to disconnect said sections and apply said brakes, substantially as described.

19. In a hose-coupler, the combination with means for accomplishing the connection and disconnection of said coupler, of a drip-valve operatively related to each section of said coupler, springs acting to hold said valves closed, and means for positively opening said valves when the coupler-sections are disconnected, substantially as described.

20. In a hose-coupler having two sections, the combination with a drip-valve on one section, of a drip-valve on the other section, said valves being so constructed and located in said sections that when said sections are in connected position said valves mutually operate to close each other, substantially as described.

21. In a hose-coupler section, the combination with a central portion having a duct, of a pin upon one side of said portion, a pin-engaging latch upon the other side of said portion, means for moving said latch into unlatched position, means for moving said pin into unlatched position, said means being operatively connected together, substantially as described.

22. In a hose-coupler section, the combination with a pin, of a latch for securing a pin from the opposing section of the coupler, means for moving said latch, and means operatively related to said means for moving said pin, substantially as described.

23. In a hose-coupler section, the combination with a central body portion having a duct, of a spring-latch mounted to turn upon said body portion, a pin, and gearing connecting said pin and latch, substantially as described.

24. In a hose-coupler section, the combination with a central body portion having a duct, of a funnel upon one side of said body portion, a spring-latch behind said funnel, a gear connected to said latch and rotatably mounted upon said body portion, a pin on the opposite side of said body portion from said funnel, and a gear engaging with said pin and the aforesaid gear, substantially as described.

25. The combination with a car, of a coupler-section, springs suspended therefrom at a pivotal point and also spring-supported at a plurality of points longitudinally displaced from said pivot, substantially as described.

26. The combination with two cars having fluid-operated brakes, of a separable coupling for connecting the brake mechanism of one car with that of the other, and including means whereby the brakes on both cars will be operated upon the parting of said cars when said coupling has not been disconnected, such brake-controlling means of the coupling being inoperative if the coupler has been disconnected.

811,069. TURPENTINE-GUTTER. JOHN W. KENNEDY, Cecil, Ga. Filed June 5, 1905. Serial No. 263,236.

Claim.—A device of the character described consisting of a pair of gutters, a right-angularly-disposed flange formed on one edge of said gutters, said flange being adapted to be forced into the tree, tacks or similar fastening devices adapted to be driven through said troughs under the flange and into the tree, and a guide-wire connected at one end to one of the troughs and its opposite end to a suitable receptacle whereby the sap will be conducted from said gutters to said receptacle, substantially as described.

811,070. RULE ATTACHMENT. JOHN KRALUND, New York, N. Y. Filed June 5, 1905. Serial No. 263,688.

Claim.—1. A body-plate with lips arranged angularly in combination with a slide having lips at a similar angle and a spring urging the slide into the angle adapted to serve with a folding rule as herein specified.

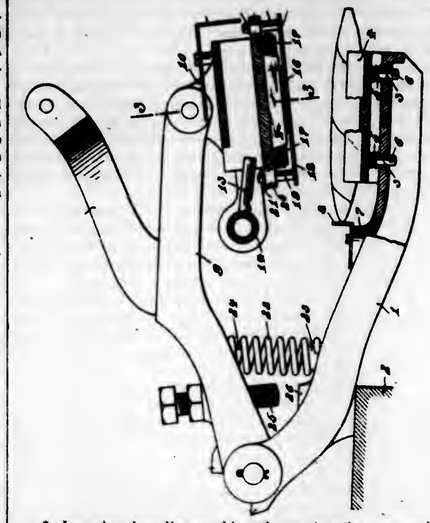
2. A body-plate with lips arranged angularly, and a rivet set therein with a raised head in combination with a slide having lips at a similar angle and a post with a raised head and a thumb-piece, each part having a slot mid-spaced between said lips and an actuating-spring all adapted to serve as herein specified.

3. A body-plate with lips arranged angularly in combination with a slide having lips at a similar angle, means for guiding the slide and a spring coiled around the rivet on the body and acting with its equal ends each against the inner face of one of the lips on the slide, adapted to serve as herein specified.

811,071. CIGAR-BRANDING MACHINE. BERNARD LEHRMAN, Philadelphia, Pa. Filed May 8, 1905. Serial No. 259,668.

Claim.—1. In a cigar-branding machine, the combination of a movable branding-die and a resiliently-supported vertically-movable cigar-holding element beneath the die for cooperating therewith.

2. In a cigar-branding machine, the combination of a movable branding-die, a vertically-movable cigar-holding element beneath the die, and resilient means for controlling the movement of said element operating to press the cigar upwardly against the die.

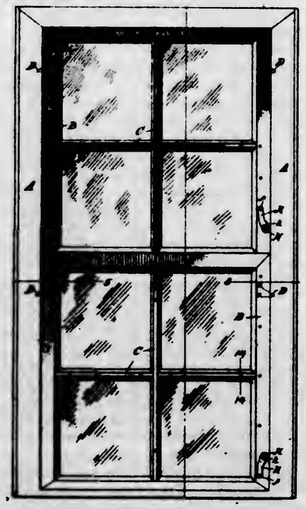


3. In a cigar-branding machine, the combination of movable branding-dies, a plurality of independently-movable cigar-holding elements beneath the dies, resilient means for controlling said movement operating to maintain pressure between the cigars and the dies.

4. In a cigar-branding machine, the combination of a movable branding element, a plurality of independently-movable cigar-holding elements beneath the branding element, and spring means for controlling said independent movement.

5. In a cigar-branding machine, the combination of a branding-die, a cigar-holding element beneath the die for cooperating therewith and a member operating intermediate the cigar-holding element and the branding-die for disengaging the cigar from said die.

811,072. FIREPROOF METAL WINDOW. ROBERT C. LEE, Chattanooga, Tenn., assignor to John E. Annis, Chattanooga, Tenn. Filed Sept. 18, 1905. Serial No. 278,068.



Claim.—1. In combination with a frame member and a sash member, of a guide carried by one of the members and working in a groove in the other member, means for supporting the guide so that it will be capable of free normal movement toward the grooved member, means whereby this movement is restricted, whereby when the sash member is open it shall have a free sliding action in the frame member, and means whereby the guide may be positively forced against the grooved member when the sash is closed.

2. In combination with a window-frame and a sash working therein, of a guide-strip carried by the sash and engaging a groove in the frame, means for supporting this guide-strip in such manner that it will have a free normal movement when the sash is open, whereby the sash may be freely restricted in the frame, means for limiting said movement of the guide-strip, and means whereby the guide-strip may be forced against the frame to lock the sash against movement in the frame.

3. A rib for a window-sash consisting of an outer hollow section provided with longitudinal flanges along its inner sides, an inner hollow section slotted along its outer side for the reception of said flanges and connecting screw-bolts passing through the inner section and between the flanges and into the outer section.

4. A rib for a window-sash consisting of an outer hollow section inclosing a nut-carrying strip and provided with longitudinal flanges, an inner hollow section engaging over said flanges, and screw-bolts passing through the inner section and between the flanges and screwed into said nuts, for the purpose set forth.

5. The combination of a hollow sheet-metal window-frame divided vertically into two weight-compartments by a stiffening-web whose edges are rigidly attached to the opposite walls of the frame, an opening being formed in the lower part of each of the inner walls of the upright members of the frame, and a slidable cover for said opening, said cover being confined between the inner wall of the upright member and the inner edge of the stiffening-web.

6. In combination with a window-frame, a slidable sash working in grooves therein, one of the edge walls of the sash being movable to and from the frame, pivotal links supporting said movable wall so that it shall have a free movement to and from the frame, means for restricting this movement, whereby the sash may slide freely in the frame without becoming disengaged therefrom, and means for releasing the movable wall so that it may be drawn back into the sash-frame to permit the sash to be removed from the window-frame.

7. In combination with a window-frame, of a sash adapted to slide therein and carrying a movable edge wall, means for supporting this edge wall so that it shall have a free normal play to and from the frame while the sash is open, means for projecting this movable wall toward the frame to lock the sash against movement in the frame, and means whereby the movable wall is limited in its movement and may be released for withdrawal back into the sash, said means consisting of a pin attached to the movable wall and projecting through a slot in the adjacent wall of the sash, and a movable locking-arm carried by the sash and having a slotted end in engagement with said pin, for the purposes set forth.

8. In combination with a window-frame, a sash working and guided therein, and means for tightening the sash against rattling and a device for actuating said means by the act of closing the sash.

9. In combination with a window-frame provided with grooves a sash provided with flanges working in said grooves, said flanges being movable to and from the frame, and means operated by the closing of the sash to project the flanges tightly against the frame to lock the sash against rattling and ingress of air.

10. In combination with a vertical window-frame, a sash vertically guided therein and carrying in one of its rails a gravitating strip carrying flanges adapted when projected beyond the edge of the sash to engage the window-frame, and a depending part adapted by the closing down of the sash to project said flanges and tighten the sash against rattling.

11. In combination with a frame member, a sash member sliding therein, a guide carried by one of the members and working in a groove in the other member, and a device for projecting the guide member upon the casing of the sash member.

12. In combination, a window-frame, a sash slidable therein a guide carried by the sash and adapted to engage the window-frame this guide being movable to and from the window-frame, and a device connected to the guide and projecting beyond the end of the sash whereby when the sash is closed the guide member will be forced tightly against the window-frame.

13. In combination, a window-frame, a sash, a guide-carrying strip inclosed in the sash-bar and movably supported therein, a device whereby the guide-carrying strip may be locked in its projected position, or permitted to recede into the sash-bar, and means for automatically tightening the guide against the window-frame when the sash is closed.

14. In combination with a window-frame, a sash working in grooves therein, one of the edge walls of the sash being movable to and from the window-frame, means for actuating the movable edge-wall for the purpose set forth, a bracket attached to a stationary part of the sash and projecting through an opening in said movable wall, weight-chains connected to the sash, one of the chains being connected to the projecting end of said bracket.

811,078. **ROOF-CARLINE.** ARTHUR LITSCHUTZ, St. Louis, Mo., assignor of one-half to Herbert W. Wolff, St. Louis, Mo. Filed Apr. 20, 1905. Serial No. 256,573.

Claim.—1. A metal roof-carline having a body formed of two folds of sheet metal connected at their lower edges, continuous flanges extending laterally from the upper edge of said body, and pressed-metal stops in said flanges extending above the upper face thereof and forming purlin-seats.

2. A metal roof-carline having a body, two continuous flanges extending laterally from the upper edge of said body and shaped to conform to the outline of the roof of the car, and stops integral and continuous with said flanges but extending above the same and forming purlin-seats.

3. A metal roof-carline having a body formed of two folds of sheet metal connected at their lower edges, flanges extending laterally from the upper edge of said body and forming purlin-seats, and brackets pressed from the metal of said body and flanges for supporting said purlin-seats.

4. A metal roof-carline the sides of which lie in intersecting planes and are provided with horizontally-extending flanges, said flanges being provided with upwardly-projecting stops forming purlin-seats, pressed brackets for said seats, and stops adapted to abut against the side plates.

811,074. **DISINFECTING COMPOUND.** MATTHEW J. MANIX, Kansas City, Mo. Filed Apr. 21, 1905. Serial No. 256,816.

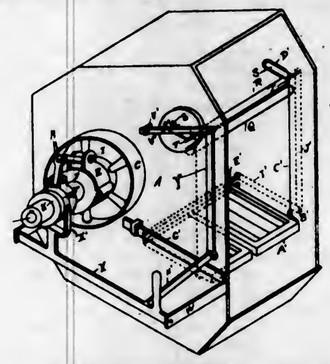
Claim.—1. A disinfecting compound comprising potassium chlorate, sulfur, strontium nitrate, shellac, potassium nitrate and sawdust.

2. A disinfecting compound comprising potassium chlorate two ounces, sulfur two ounces, strontium nitrate six ounces, shellac one ounce, potassium nitrate one ounce, sawdust fifteen ounces, kneaded into a paste and permitted to dry in pasteboard tubes.

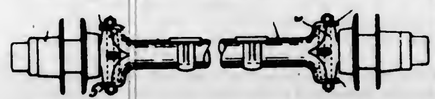
811,075. **STOP-MOTION FOR FULLING-MACHINES.** ARTHUR D. MANSELL, Newport, Me., assignor to The Leavitt Automatic Stop Motion Company, a Corporation of Maine. Filed May 20, 1905. Serial No. 261,727.

Claim.—1. In a stop-motion for fulling-machines, a pivotally-mounted guide-rock, two bars positioned between said guide-rock and the drawing-rolls, one movable away from the other, and means operable by said rock to stop the machine.

2. In a stop-motion for fulling-machines, a pivotally-mounted guide-rock, two bars positioned in front of the drawing-rolls, one movable away from the other, a rod having one end attached to the guide-rock and the other end provided with a loop through which the end of said movable bar passes and in the bottom of which it rests and means operable by said rock, rod and movable bar to stop the machine.



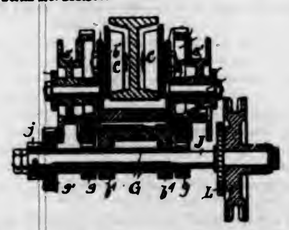
811,076. **FRONT AXLE FOR AUTOMOBILES.** FREDERICK C. MILLER, Cincinnati, Ohio. Filed Apr. 13, 1905. Serial No. 255,576.



Claim.—1. A front axle for automobiles, consisting of a tube, the ends of which have been slitted and swaged apart to form jaws.

2. A front axle for automobiles, consisting of a tube, the ends of which have been slitted and swaged apart to form jaws, the slitted edges of the tube forming arched side walls to the jaws.

811,077. **HOIST.** EDWARD Y. MOORE, Cleveland, Ohio. Filed Nov. 2, 1905. Serial No. 285,577.



Claim.—1. In a hoist, the combination of a frame having a pair of side members, supporting-wheels on the inner sides of said members, elevating-wheels carried on the outer sides of said members, a cross-shaft extending through the frame below said supporting-wheels, and gears on said cross-shaft connected with gears on the elevating-wheels.

2. The combination with a beam having flanges extending in opposite directions, of a hoist located beneath and on opposite sides of said beam, said hoist having supporting-wheels adapted to ride on the upper sides of said flanges, journals for the elevating-wheels opposite the respective sides of the supporting-beam, and elevating-wheels on such journals.

3. The combination of a beam having a flange along its lower edge, a hoist having supporting-wheels adapted to ride on said flange, said hoist having elevating-wheels journaled on its sides opposite the supporting-wheels and a driving-shaft extending crosswise beneath the beam and operatively connected with the elevating-wheels.

4. In a hoist, in combination, a frame having side walls and a connecting part, supporting-wheels carried on the inner faces of side walls, elevating-wheels carried on the outer faces of the side walls, and a driving-shaft extending crosswise of the frame and operatively connected with the elevating-wheels.

5. In a hoist, the combination of a frame having a pair of side members, supporting-wheels carried on the inner faces of said side members, studs projecting outwardly from the side members, elevating wheels supported on said studs, and means for rotating said elevating-wheels.

6. In a hoist, in combination, a U-shaped frame having sides and an under connecting part, supporting-wheels carried on the inner faces of the sides, studs projecting outwardly from the sides, bosses on the outer sides supporting said studs, elevating-wheels journaled on said studs, and recessed on their inner faces to clear the bosses, and means for rotating said elevating-wheels.

7. In a hoist, the combination of a frame carrying bosses on its outer sides, studs projecting outwardly from said bosses, wheels on said studs and recessed on their inner faces to clear the bosses, gear-teeth formed on the periphery of said wheels outside of said recesses, driving mechanism geared with said wheels by means of said gear-teeth, and the flexible elevating member mounted on said wheels.

8. In a hoist, the combination of a frame, bosses on the outer sides thereof, studs projecting from said bosses, elevating-wheels on said studs, said wheels being formed with gear-teeth and an annular external groove for the reception of a flexible elevating member, a shaft journaled in said frame, and pinions on said shaft meshing with said gear-teeth.

9. In a hoist, the combination of a frame having a pair of side members, supporting-wheels carried on the inner faces of said side members, studs projecting outwardly from the side members, wheels supported on said studs and having gear-teeth and formed to receive the flexible supporting member, and means engaging said gear-teeth for rotating them.

10. In a hoist, the combination of a frame having a pair of side members, supporting-wheels carried on the inner faces of said side members, studs projecting outwardly from the side members, wheels supported on said studs and having gear-teeth and formed to receive the flexible supporting member, a shaft journaled in the frame, and a pair of pinions on said shaft meshing with said gears.

11. In a hoist, the combination of a frame made in two halves, each half comprising a side member and an under member, and bolts connecting the two halves to make a U-shaped structure, supporting-wheels carried on the inner faces of the side members, studs projecting from the outer faces of the side members, geared elevating-wheels journaled on said studs, a cross-shaft journaled in said frame beneath the side members and carrying a pair of pinions meshing with the gear, and means for rotating such cross-shaft.

12. In a hoist, the combination of a frame, supporting-wheels carrying the same, elevating-wheels mounted on opposite sides of the frame, a cross-shaft journaled in said frame and carrying a pair of pinions meshing with gear-teeth on the elevating-wheels, said shaft being hollow, another shaft occupying said hollow shaft and carrying a pinion, an idle gear meshing with such pinion, a pinion rigid with said idle gear, and a gear on said hollow shaft meshing with such idle pinion.

13. In a hoist, the combination of a frame made in two halves, each half comprising a side member and an under member, bolts connecting the two halves to make a U-shaped structure, studs projecting from the outer faces of the side members, elevating-wheels journaled on said studs and having gear-teeth, a cross-shaft journaled in downwardly-extending lugs of said frame beneath the side members, a pair of pinions on said shaft meshing with said gear-teeth, said shaft being hollow, another shaft occupying said hollow shaft, and gearing connecting said shafts.

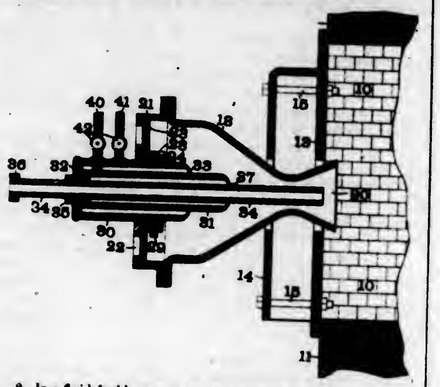
14. In a hoist, in combination, a frame having sides and a cross connecting part, supporting-wheels carried on the inner faces of the sides, studs projecting outwardly from the sides, bosses on the outer sides supporting said studs, elevating-wheels journaled on said studs, and means for rotating said elevating-wheels.

15. The combination with a beam having flanges extending in opposite directions, of a hoist located beneath and on opposite sides of said beam, said hoist having supporting-wheels adapted to ride on the upper sides of said flanges, said hoist having a pair of opposed elevating-wheels opposite the respective sides of the supporting-beam, whereby the head-room is diminished.

811,078. **FLUID-FUEL BURNER.** FREDERICK L. MCGAHAN and EDWARD C. PLAGER, St. Louis, Mo.; said Plager assignor to said McGahan. Filed Feb. 11, 1905. Serial No. 245,301.

Claim.—1. In a fluid-fuel burner, a mixing-chamber, a steam-ope-

duit opening into said chamber for discharging a jet of steam therein, a fluid-fuel conduit opening into said chamber and projecting beyond said steam-jet, and an air-conduit passing through said steam and fuel conduits and opening into said chamber between the mouth of said fluid-fuel conduit and the mouth of said mixing-chamber.



2. In a fluid-fuel burner, a mixing-chamber having a contracted throat and flaring outlet, a cap carried by said mixing-chamber, air, steam and fuel conduits carried by said cap and discharging in said mixing-chamber, said cap being provided with an air-inlet surrounding said steam and fuel conduits, and a valve controlling said inlet.

3. In a fluid-fuel burner, a mixing-chamber having a contracted throat and a flaring outlet, a hot-air chamber, a hot-air conduit connecting said hot-air chamber and mixing-chamber, an adjustable air-pipe extending beyond the discharge end of said hot-air conduit, a fuel-conduit discharging into said mixing-chamber between the discharge end of the hot-air conduit and the air-pipe, and a steam-conduit also discharging into said mixing-chamber.

4. In a fluid-fuel burner, a mixing-chamber, a hot-air chamber, a hot-air conduit connecting said hot-air chamber and mixing-chamber, a steam-pipe projecting into said mixing-chamber, a fluid-fuel conduit discharging into said mixing-chamber beyond said steam-pipe, and an air-pipe discharging beyond the discharge end of said fuel-conduit.

5. In a fluid-fuel burner, the combination with a mixing-chamber having a contracted throat and a flaring outlet, of a steam-conduit projecting into and terminating within said chamber, a fuel-conduit extending through said steam-conduit and terminating beyond the same and in said mixing-chamber, and an air-pipe extending through said fuel-conduit and terminating in said flaring outlet.

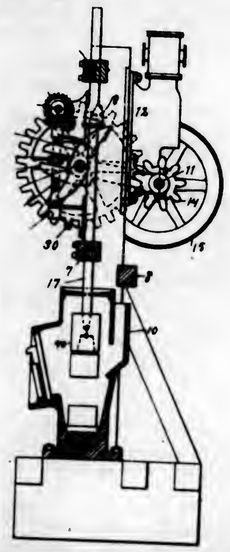
6. The combination with a plate forming part of the inclosing wall of the furnace, of a hot-air chamber carried by said plate, a mixing-chamber extending through said hot-air chamber, steam and fuel conduits terminating in said mixing-chamber, and an air-conduit connecting said hot-air chamber with said mixing-chamber.

7. The combination with a plate forming part of the inclosing wall of a furnace, of a hot-air chamber carried by said plate, a mixing-chamber provided with a contracted throat and a flaring outlet and extending through said hot-air-chamber, a cap carried by said mixing-chamber, a steam-conduit extending through said cap, a fuel-conduit extending through said steam-conduit, an air-pipe extending through said fuel-conduit and longitudinally adjustable, and an adjustable air-inlet in said cap.

8. The combination with a plate forming part of the inclosing wall of a furnace, of a hot-air chamber carried by said plate, a mixing-chamber provided with a contracted throat and a flaring outlet and extending through said hot-air chamber, a cap carried by said mixing-chamber, a steam-conduit extending through said cap, a fuel-conduit extending through said steam-conduit, an air-pipe extending through said fuel-conduit and longitudinally adjustable, an adjustable air-inlet in said cap, and a hot-air conduit connecting said hot-air chamber and said mixing-chamber.

811,079. STAMP-ACTUATING MECHANISM FOR ORE-CRUSHERS. WALTER S. MCKINNEY, Chicago, Ill. Filed May 28, 1906. Serial No. 318,222.

Claim.—1. In a stamp-actuating mechanism, the combination of a driving-gear, a cam-shaft, a cam upon said shaft, driving connections between the driving-gear and cam-shaft, and supports adjustably supporting said cam-shaft to move bodily in an arc concentric with the axis of the driving-gear.



2. In a stamp-actuating mechanism, the combination of a driving-gear, a cam-shaft, a gear and cam upon said shaft, said latter gear arranged to mesh with the driving-gear, links supports adjustably supporting said cam-shaft to move bodily in an arc concentric with the axis of the driving-gear, and a stamp-stem carrying a tappet mounted adjacent to said cam-shaft.

3. In a stamp-actuating mechanism, the combination of a main shaft and driving-gear thereon, a cam-shaft arranged to extend parallel with the main shaft, a gear and cam on said cam-shaft, said latter gear arranged to intermesh with the gear of the main shaft, links pivotally supported concentrically with the main shaft and supporting at their swinging ends the cam-shaft, adjusting devices operatively connected with said links, and a stamp-stem provided with a tappet, arranged to reciprocate adjacent to said cam-shaft.

4. In a stamp-actuating mechanism, the combination of a main shaft and driving-gear thereon, a cam-shaft arranged to extend parallel with the main shaft, a gear and cam on said cam-shaft, said latter gear arranged to intermesh with the gear of the main shaft, links pivotally supported concentrically with the main shaft and supporting at their swinging ends the cam-shaft, vertically-disposed adjusting-screws operatively connected with the ends of the links, and a stamp-stem provided with a tappet, arranged to reciprocate vertically adjacent to said cam-shaft.

5. In a stamp-actuating mechanism, the combination of a main shaft and driving-gear thereon, a cam-shaft arranged to extend parallel with the main shaft, a gear and cam on said cam-shaft, said latter gear arranged to intermesh with the gear of the main shaft, links pivotally supported concentrically with the main shaft and supporting at their swinging ends the cam-shaft, vertically-disposed adjusting-screws operatively connected with the ends of the links, a gear upon each adjusting-screw, a cross-shaft arranged to extend transversely of said adjusting-screws, gears upon said cross-shaft operatively engaging the gears of the respective adjusting-screws, and means for locking said cross-shaft in adjusted position.

6. In a stamp-actuating mechanism, the combination of a suitable main frame comprising three upright standards and a bed-plate connected to and extending between two of said standards, a motor mounted upon said bed-plate, a main drive-shaft operatively connected with the motor, and journaled to extend across the central standard and the standard remote from the bed-plate, a driving-gear upon said main shaft, a pair of links mounted to oscillate upon said main shaft at points adjacent to the intermediate standard and the standard remote from the bed-plate respectively, a cam-shaft journaled in the outer ends of said links to extend parallel with the main shaft, vertical adjusting-screws supported upon said standards in

vertical register with the supporting-links and having screw-threaded engagement with the latter, a miter-gear upon each adjusting-screw, a cross-shaft provided with miter-gears engaging the respective gears of the adjusting-screws, a ratchet-and-pawl mechanism for locking said cross-shaft in adjusted position, a driven gear upon said cam-shaft intermeshing with the gear of the main shaft, a plurality of cams upon said cam-shaft, and a plurality of stamp-stems supported to reciprocate vertically adjacent to the cam-shaft.

811,080. MOLD FOR MAKING BUILDING-BLOCKS. HENRY NOAH, Baxter, Iowa. Filed June 13, 1905. Serial No. 265,421.

Claim.—1. In a separable front for a building-block mold, a front side having hinged ends and a hinged top.

2. In a separable front for a building-block mold, a front side having hinged ends and a hinged top and a hinged bottom.

3. In a separable front for a building-block mold, a front side having hinged ends, a hinged top, a hinged bottom and a metal plate detachably connected with the pieces hinged to the front side.

4. In a separable front for a building-block mold, a front side having hinged ends and a hinged top and a hinged bottom, a turn-button pivoted to the front face of the side to engage the edge of the hinged top, for the purposes stated.

5. In a separable front for a building-block mold, a front side having hinged ends and a hinged top and a hinged bottom and turn-buttons pivoted to the outside face of the front side.

6. In a separable front for a building-block mold, a front side having hinged ends and a hinged top and a hinged bottom and turn-buttons pivoted to the outside face of the front side and means for locking them.

7. In a separable front for a building-block mold, a front side having hinged ends and a hinged top and a hinged bottom and turn-buttons pivoted to the outside face of the front side, a lever pivoted to the front side and connected with the turn-buttons by links for locking them.

8. In a separable front for a building-block mold, a front side having hinged ends and a hinged top, a rear side and two ends provided with dowels to enter apertures in the bottom of the mold and means to lock all the parts together.

9. In a separable front for a building-block mold, a front side having hinged ends and a hinged top, a rear side and two ends provided with dowels to enter apertures in the bottom of the mold, eccentrics adjustably connected with the ends to engage the outside faces of the front and rear sides of the mold for clamping the sides to the ends.

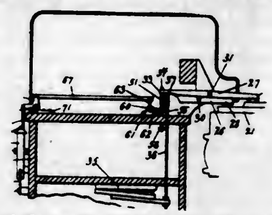
10. In a mold for making building-blocks, a bottom, a front side having hinged pieces at its ends, a rear side, ends fitted between the hinged pieces and the rear side, links pivoted to the ends and eccentric clamps pivoted to the links to engage the outside faces of the parallel sides and means to support the outer ends of the links and clamps.

811,081. SUSPENDERS. FRANK B. NORRIS, Helena, Mont. Filed May 15, 1905. Serial No. 260,582.

Claim.—1. An improvement in suspenders, consisting of two main straps or webs, having free looped ends, each end provided with an adjusting-buckle and a cast-off, and a cross-strap provided with an adjusting-buckle, in combination with two suspender-cords, buttoning at the ends only, to buttons placed on the sides of the garment supported, each cord being engaged by the cast-offs at each end of the same web, only.

2. An improvement in suspenders, consisting of two main elastic webs, each web having free adjustable looped ends, each end provided with a cast-off, a cross-web in two segments, one attached to each web, a buckle adjustably connecting the two cross-segments, in combination with two cords, buttoning at the ends only, each cord being slidably engaged by both the cast-offs of one of the webs.

811,082. MECHANICAL PIANO-PLAYER. JAMES O'CONNOR, New York, N. Y. Filed Feb. 17, 1904. Serial No. 193,948.



Claim.—1. In a mechanical piano-player, the combination with automatic devices for selectively operating the key-fingers, of means for moving the key-fingers a portion of their stroke in advance of the action of the automatic devices.

2. In a mechanical piano-player, the combination with automatic devices for selectively operating the key-fingers, of means for moving a predetermined section of the key-fingers a portion of their stroke in advance of the action of the automatic devices.

3. In a mechanical piano-player, the combination with automatic devices for selectively operating the key-fingers, of means for independently moving predetermined key-fingers a portion of their stroke in advance of the action of the automatic devices.

4. In a mechanical piano-player, the combination with a series of key-fingers, of a plurality of bars, each adapted to engage a predetermined number of the key-fingers to move them a portion of their stroke, and means for independently operating each bar.

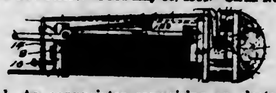
5. In a mechanical piano-player, the combination with a series of key-fingers, of a plurality of bars, each adapted to engage a predetermined portion of the key-fingers to move them simultaneously a portion of their stroke, and means convenient to the hand of the performer for operating the bars independently.

6. In a mechanical piano-player, the combination of means for varying the amplitude of movement of the key-fingers to modify their effect on the piano-keys, and means for independently adjusting the zone of movement of the individual key-fingers.

7. In a mechanical piano-player, the combination, with a series of key-fingers, of a plurality of bars each mounted in operative relation to a predetermined set or section of the fingers, and a series of adjusting-screws for independently adjusting the zone of movement of the individual key-fingers.

8. In a mechanical piano-player, the combination with a series of key-fingers, of a plurality of bars each mounted in operative relation to a predetermined set or section of the key-fingers, a series of adjusting-screws for independently adjusting the zone of movement of the individual key-fingers, and means for independently operating each bar to vary the amplitude of movement of the keys of the respective sections.

811,088. ANNUNCIATOR. HALVOR M. OLSEN, Chicago, Ill., assignor to American Electric Telephone Company, Chicago, Ill., a Corporation of New Jersey. Filed May 16, 1901. Serial No. 60,798.



Claim.—1. An annunciator comprising an electromagnet, a frame secured to the forward end of said magnet, a target pivoted upon said frame, a convex cover secured to the forward end of the frame in front of the target, said cover being provided with an opening adapted to expose the face of the target, the curvature of the cover corresponding to the arc described by the forward end or face of the target, and an armature arranged to raise the forward end of the target.

2. An annunciator comprising an electromagnet, a convex cap

secured to the forward end of the magnet structure and provided with an opening, the pivoted target having a convex face adapted to swing in close proximity to the curved inner surface of said cap, and an armature for actuating said target.

3. In an annunciator, a supporting-plate having an aperture therein, a target having an arc-shaped face and a rearwardly-extending arm or arms projecting through said aperture, and pivoted on said support, an arc-shaped covering for said target having an aperture or window through which the target may be displayed, a magnet and armature in the rear of said supporting-plate, connections between the said armature and extended target-arms to operate the target.

4. In an annunciator, a supporting-plate having an aperture therein, an arc-shaped target having rearwardly-extending arms projecting through said aperture, and pivoted on said plate, a covering over the same similar in form to the target and having an opening therefor, a rivet or pin between the ends of the target-arms, a magnet in the rear of said supporting-plate, an armature therefor, an arm carried by said armature and adapted to act upon the rivet or pin and the target-arms to operate the same.

5. In an annunciator, two supporting-plates spaced apart, the front plate having an aperture therein, a target having a segmental face and rearwardly-extending arms, said arms being pivoted to said apertured plate at the center of the curve of the face and extending beyond the pivot and having a pin therethrough, a magnet secured to the rear face of the other supporting-plate, a longitudinal armature therefor, an arm affixed to said armature and extending down between the said plates, said arm having a foot portion adapted to bear upon said pin to operate the target upon the operation of the magnet and armature.

6. The combination of a convex cap provided with an opening, a pivoted target arranged back of said cap, the indicating end of said target being normally depressed, an electromagnet arranged back of said target, and an armature extending lengthwise above the magnet and provided with an arm adapted to engage the rear end of said target, the armature when attracted operating to raise the forward end of the target.

7. The combination of an electromagnet, two plates separated by four short members and rigidly connected with the forward end of the magnet, a convex cap secured to the outer of said plates and provided with an opening, a pivoted target arranged back of said cap, and an armature having a forwardly-extending arm adapted to engage said target.

8. An annunciator, comprising a magnetic core having a relatively flat pole-piece disposed in the plane of one end and having its other end extended, an armature provided with a rear vertical portion suitably mounted on the extended rear end of the core and having its horizontal portion overlying the pole-piece, a finger on the forward end of the armature, a spring tending normally to keep the armature raised, and a target hung on the forward end of the magnet structure and held in a normally lowered position, said target having a rearwardly-extending projection underlying the said finger, whereby said target is raised when the armature is attracted.

9. An annunciator comprising a magnetic core having a relatively flat pole-piece disposed in the plane of one end, an armature provided with a rear vertical portion suitably mounted at the other end of the magnet and having its horizontal portion overlying the pole-piece, the forward end of said armature being provided with a finger, a target hung from the forward end of the magnet structure, and a spring-switch tending normally to keep the armature raised, said target being normally down and having a rear projection underlying the said finger, whereby the target is raised when the armature is attracted.

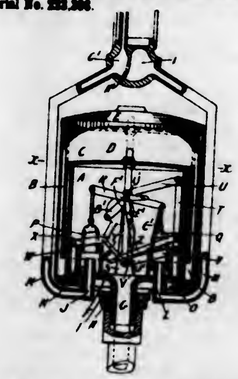
10. An annunciator, comprising an electromagnet, pieces of insulation secured to the opposite ends of said magnet, pole-pieces also secured to the opposite ends of said magnet, an armature mounted upon the rear end of the magnet structure and having its horizontal portion overlying both pole-pieces, parallel terminal strips rigidly secured to said pieces of insulation at opposite sides of the magnet, a shutter carried by the forward end of the magnet structure and operated by said armature, and switch-contacts carried by said terminal strips beneath the armature and operated by the latter.

11. An annunciator comprising an electromagnet, pieces of insulation secured to opposite ends of said magnet, an armature suitably mounted upon the rear end of the magnet structure and having its horizontal portion overlying the magnet, a shutter engaged and operated by the forward end of the armature, terminal strips secured to said pieces of insulation at opposite sides of the magnet, and switch-contacts carried by the said terminal strips beneath the armature and opened and closed by the latter.

12. In a signaling device, the combination with a magnet having a coil, insulating-supports at each end of the coil, a core therefor, end pieces affixed to said core, an armature extending longitudinally of the coil and coöperating with the end pieces, electrical contacts carried by said insulating-supports, one of said contacts being of spring material to return the armature to normal position, means to close the said contacts in the initial movement of the armature, and the signal-indicating device operated by said armature in its forward movements.

13. In an annunciator, the combination with a magnet of a core and end pieces therefor, insulating-blocks between the end pieces and the coil, longitudinal strips secured to said insulating-pieces, stationary contact on one strip, a spring-contact on the other strip and adapted to coöperate with the stationary contact, an armature extending longitudinally of the coil pivoted at one end and adapted to be retracted by said spring-contact, and a signaling device operated by said armature.

811,084. **REGULATOR FOR GAS-LAMPS.** OLE M. J. OLSEN and WALTER GAYNS, Parramatta, New South Wales, Australia. Filed Sept. 6, 1904. Serial No. 223,206.



Claim.—1. In apparatus controlled by gas-pressure for lighting and extinguishing gas-burners, a fixed chamber in combination with a removable foundation-plate inclosed by the same and provided with a centrally-situated gas-passage, two gas-outlet tubes and valves or bells P and Q respectively governing the same substantially as set forth.

2. In apparatus controlled by gas-pressure for lighting and extinguishing gas-burners, a chamber, a foundation-plate inclosed thereby and two gas-outlet tubes in combination with mercury-chambers, movable bells adapted to both seal and unseal the said gas-conducting tubes, mechanism connecting the said bells together in order that the ascent of one bell may lower the other and externally-situated gas-pipes substantially as set forth.

3. In combination with an inclosed removable foundation-plate provided with a centrally-situated gas-passage, a union and two gas-outlet tubes, a standard, a pendulum carried thereby, a looped lever, a balance-lever, bells suspended from the said balance-lever, two side standards, levers carried by said side standards, a movable gas-bell, a central stem for the same and connecting-rods adapted to be operated by the said stem substantially as and for the purpose set forth.

4. The bell of a gas-regulator in combination with a fixed chamber covered thereby, a container concentric with said chamber and exteror to said bell, a removable foundation-plate inclosed by said chamber, and the operative mechanism governing the supply of gas to the burners and mounted on said plate, which consists of a central stem, upper and lower parallel bars carried thereby, a fixed side standard to which the opposite ends of said parallel bars are connected, an oppositely-situated side standard, a lever carried by the latter side standard and a connecting-rod of this lever which is attached to the central stem and to a lower parallel bar substantially as and for the purpose set forth.

5. In mechanism operated by a movable gas-bell for regulating the operation of gas-burners, the combination of a suspended pendulum, a looped lever, a stop on said lever adapted to coöperate with the said pendulum, an independent lever adapted to engage with the said looped lever, a pair of devices closing and opening the supply-pipes of two burners alternately, a balance-lever and attachments connecting the said devices together in order that the ascent of either device will coincide with the lowering of the other in opening and closing the said pipes substantially as set forth.

6. In a gas-regulator, the combination of a gas-bell with upper and lower parallel bars, the central stem of said bell, a balance-lever arranged exteriorly to said stem to allow of its upward and downward movements and devices suspended from the ends of the said balance-lever for closing and opening the supply-pipes of two burners alternately, an independent lever, a connection between the said independent lever and the said balance-lever, a looped lever engaged by said independent lever and a suspended pendulum mounted on the said stem and arranged for contact with a stop on said looped lever substantially as set forth.

811,085. **PROCESS OF RECOVERING VALUES FROM SULFID ORES.** EDWIN C. POHLE, Reno, Nev. Filed June 1, 1905. Serial No. 263,223.

Claim.—1. The process of recovering values from sulfid ores containing gold, and silver, which consists in mixing the ore with a chlorid, subjecting the mixture to heat in an oxidizing atmosphere, cooling the product, leaching the mass with water, to remove the contained bodies soluble therein, leaching the residue with a solution of a cyanid of an alkali metal, and, finally, precipitating the gold and silver from the solution.

2. The process of recovering values from sulfid ores containing gold and silver, which consists in mixing the ore with a chlorid subjecting the mixture to the flame of combustion with an excess of air, conducting off the gaseous products, condensing and collecting the metallic vapors, cooling the solid products, leaching the mass with a solution of a cyanid of an alkali metal, and precipitating the gold and silver from the solution, substantially as described.

3. The process of recovering values from sulfid ores containing gold, silver and base metals, which consists in mixing the ore with a chlorid, subjecting the mixture to the flame of combustion with an excess of air, conducting off the gaseous products, condensing and collecting the metallic vapors, cooling the solid products, leaching the mass with water to remove the contained bodies soluble therein, leaching the residue with a solution of a cyanid of an alkali metal and precipitating the gold and silver from the solution, substantially as described.

4. The process of recovering values from sulfid ores containing gold and silver which consists in mixing the ore with a chlorid, subjecting the mixture to the flame of combustion with an excess of air, conducting off the gaseous products, condensing and collecting the metallic vapors, cooling the solid products, leaching the mass with a solution of a cyanid of an alkali metal and precipitating the gold and silver from the solution substantially as described.

5. The process of recovering values from sulfid ores containing gold and silver which consists in mixing the ore with a chlorid, subjecting the mixture to heat in an oxidizing temperature, cooling the product, leaching the mass with water to remove the contained bodies soluble therein, leaching the residue with a solvent of gold and silver, and finally precipitating the gold and silver from the solution.

6. The process of recovering values from sulfid ores containing gold and silver, which consists in roasting the ore in contact with the flame of combustion with an excess of air, conducting off the products of combustion and resulting vapors by a forced draft, condensing the metallic vapors and filtering them from the permanent gases, substantially as described.

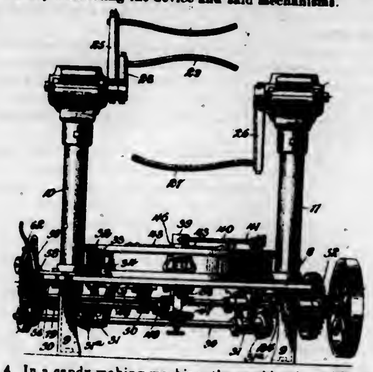
7. The process of recovering values from sulfid ores containing gold and silver, which consists in mixing the ore with a chlorid, subjecting the mixture to the flame of combustion with an excess of air, conducting off the products of combustion and resulting metallic vapors by a forced draft, condensing the metallic vapors and filtering them from the permanent gases, substantially as described.

811,086. **CANDY-MAKING MACHINE.** GUST PRATTS, Flint, Mich. Filed Mar. 14, 1905. Serial No. 250,056.

Claim.—1. In a candy-making machine, the combination with a base, of mixing mechanism mounted thereon, pulling mechanism also mounted on the base, and driving means for said mechanism also mounted on the base.

2. In a candy-making machine, the combination with a base, of mixing mechanism mounted thereon, pulling mechanism also mounted on the base and located over the mixing mechanism, and driving means for said mechanisms mounted beneath the base.

3. In a candy-making machine, the combination with supporting means including a base and standards, of mixing mechanism mounted on the base, pulling mechanism mounted on the standards, a driving device, and gearing mounted on the supporting means and detachably connecting the device and said mechanisms.



4. In a candy-making machine, the combination with supporting means including a base, legs and standards, of mixing mechanism mounted on the base, pulling mechanism mounted on the standards, a driving device mounted beneath the base, and separate sets of gearing detachably connecting the driving device and said mechanism.

5. In a candy-making machine, the combination with supporting means including a base having depending legs and upstanding standards, of mixing mechanism mounted on the base, pulling mechanism mounted on the standards, a drive-shaft having a gear, separate gearing connected to the mixing mechanism and the pulling mechanism and including idlers in mesh with the gear, and swinging supports journaled on the supporting means and carrying the idlers, said supports moving said idlers into and out of engagement with the gear on the shaft.

6. In a candy-making machine, the combination with a base, of mixing and pulling mechanisms mounted thereon, a driving-shaft having a gear, counter-shafts respectively connected to the mixing and pulling mechanisms and having gears disposed contiguous to the gear on the driving-shaft, swinging supports, idlers carried by said supports, said idlers meshing with the gear on the driving-shaft and the gears on the counter-shafts, and means for holding the supports in different relations.

7. In a candy-making machine, the combination with a base, of rotatable mixing mechanism centrally mounted thereon, gearing for the same extending centrally beneath the base and including bevel gear-wheels, rotatable pulling mechanism mounted on the base above the mixing mechanism, gearing for the same including bevel-gears located beneath opposite side portions of the base, a drive-shaft extending beneath the base, power mechanism connected to one end of the drive-shaft, counter-shafts respectively geared to the bevel-gears of the mixing mechanism and the bevel-gears of the pulling mechanism, a gear-wheel mounted on one end of the drive-shaft, gears secured to the adjacent ends of the counter-shafts, swinging supports journaled on said counter-shafts, idlers carried thereby and meshing with the counter-shaft gears, said idlers being movable into and out of the gear of the drive-shaft when the supports are swung, and means for securing the supports against movement.

8. In a candy-making machine, the combination with a base having an upright support, of separate pulling-arms of different lengths journaled on the support and having substantially horizontal and coincident journal-axes, outstanding candy engaging and supporting elements carried by the arms and having upright paths of movement, a drive-shaft journaled beneath the base, and connections between the drive-shaft and arms for rotating the arms simultaneously in opposite directions, said connections being associated with the support.

9. In a candy-making machine, the combination with a base having an upstanding support, of concentric substantially horizontal shafts journaled on the upper portion of the support, pulling-arms carried by the shafts and provided with outstanding candy-supporting elements having upright paths of movement, and means for operating the shafts, said means including a substantially horizontal driving-shaft journaled on the base and having gear connections with the concentric shafts.

10. In a candy-making machine, the combination with a base, of a tubular standard mounted thereon, concentric shafts journaled on the standard, pulling-arms of different lengths carried by the shafts and having candy-engaging means, an upright shaft journaled in the standard, and gearing connecting the shaft and the shafts carrying the arms.

11. In a candy-making machine, the combination with a base, of spaced upright tubular standards secured thereto, shafts journaled in the standards, coacting arms carried by the shafts, upright shafts journaled in the standards, gearing connecting the upright and arm carrying shafts, and means located beneath the base for rotating the upright shafts.

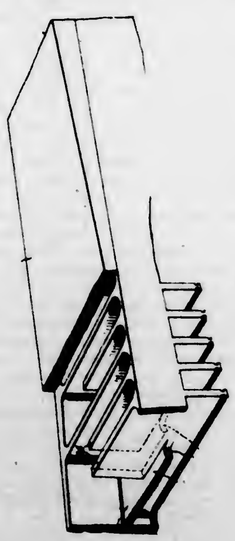
12. In a candy-making machine, the combination with spaced supports, of oppositely-rotatable shafts on one of the supports, pulling-arms carried by the shafts and being thus rotatable in opposite directions, said arms having candy-engaging portions, and another pulling-arm journaled on the other support and having its axis of rotation substantially parallel to the axes of rotation of the first-mentioned arms, said last-mentioned arm being provided with a candy-engaging portion having a path of movement intersecting the paths of movement of the candy-engaging portions of said first-mentioned rotatable arms.

13. In a candy-making machine, the combination with spaced standards, of concentric shafts journaled on one standard, pulling-arms of different lengths carried by the shafts, another shaft journaled on the other standard, a pulling-arm carried by the latter shaft and coacting with the arms of the first-mentioned shafts, means for rotating the concentric shafts in different directions and also for rotating the single shaft.

14. In a candy-making machine, the combination with a base, of spaced standards mounted thereon, journal-boxes carried by the upper ends of the standards, concentric shafts journaled in one of the boxes, an upright shaft located in the standard and geared to the concentric shafts for driving the same in opposite direction, a shaft journaled in the box of the other standard, an upright shaft journaled in said standard and geared to the shaft for rotating the same, pulling-arms carried by the shafts in the boxes and having intersecting paths of movement, and gearing located beneath the base for driving the upright shafts.

15. In a candy-making machine, the combination with spaced supports, of concentric shafts journaled on one of the supports, pulling-arms carried by the shafts and having different paths of movement, another pulling-arm journaled on the other support and having a path of movement that intersects the paths of movement of the first-mentioned arms, and means for rotating the shafts and last-mentioned arm.

811,087. REED-ORGAN. PERCY C. PRESTON, Denison, Tex. Filed Sept. 1, 1905. Serial No. 276,753.

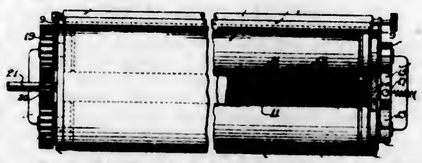


Claim.—1. In a reed-board, reed-cells, resonance-cells arranged above the reed-cells and separated therefrom by horizontally-disposed wind-guards or partitions that terminate short of the front ends of the cells, partitions dividing the resonance-cells into groups, the members of each group being in communication with each other.

2. In a reed-board, reed-cells and resonance-cells, a horizontally-disposed wind-guard or partition separating the reed-cells from the resonance-cells and terminating in advance of the front ends of said cells, the partitions which divide the resonance-cells having their rear ends cut away to place the cells in communication with each other, the lengths or depths of such partitions being determined by the positions of the cells in the register.

3. In a reed-organ, reed-cells and resonance-cells, a horizontally-disposed wind-guard or partition separating the reed-cells and resonance-cells from each other, and terminating short of the front ends of said cells, partitions dividing the resonance-cells into groups, and intermediate partitions dividing each group into separate cells, the rear ends of said intermediate partitions being cut away to place the cells of each group in communication with each other

811,088. ELECTRIC DRYING AND IRONING APPARATUS. GEORGE W. RICHARDSON, Wissahickon, Pa., assignor of one-half to Stephen T. Major, Norristown, Pa. Filed Mar. 28, 1905. Serial No. 252,592.



Claim.—1. In apparatus of the class described, drying and ironing mechanism comprising a plurality of rollers coacting to press and dry material passed therethrough, each of said rollers comprising a brass ironing-cylinder, a resistance-coil therein adjacent thereto, bearings for said rollers, a conductor connected to and revolving with each of said rollers, means for insulating each of said conductors from the respective cylinders and bearings, and a brush making contact with each of said conductors in combination with a casing having end walls disposed between said ironing-cylinders and brushes, substantially as specified.

2. In apparatus of the class described, a casing having a passage therethrough, and a plurality of rollers journaled in said casing and coacting to press material in said passage, the respective rollers comprising a brass ironing-cylinder and a resistance-coil located in and concentric to said cylinder, substantially as specified.

3. In apparatus of the class described, a casing having closed ends, ironing-rollers journaled in said ends, the body of said casing conforming to said rollers and forming passages thereto and therefrom, and a resistance-coil in each of said rollers, substantially as specified.

4 In apparatus of the class described a casing having closed ends, ironing-rollers journaled in said ends, and a guideway in said casing between pairs of said rollers, said casing having an inlet to and an outlet from said rollers and guideway, substantially as specified.

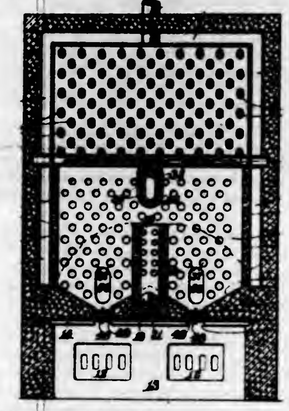
5. In apparatus of the class described, a casing having closed ends, ironing-rollers journaled in said ends, plates supported by said casing and forming a guideway between pairs of said rollers, and feeding mechanism for carrying material to said rollers, substantially as specified.

6. In apparatus of the class described, a casing having closed ends, ironing-rollers journaled in said ends, heat-insulating material in said casing about said rollers, mechanism for connecting and operating said rollers together, a guide leading to said rollers, and a feed-roller coacting with said guide, substantially as specified.

811,089. HOT-AIR HEATING SYSTEM. WILLIAM H. ROGERS, Cambridge, Mass. Filed Aug. 5, 1905. Serial No. 272,611.

Claim.—1. In a heating system, the combination of a fire-pot, a central retort therein extending upwardly from the floor of said fire-pot into which it opens at the top and provided with means for emitting gas from the interior thereof through the side walls, and means for supplying said retort with a combustible capable of generating gas.

2. In a heating system, the combination of a fire-pot, a central retort therein opening at the top into said fire-pot and provided with a plurality of perforations through the side walls thereof, and means for supplying said retort with combustibles.



3. In a heating system, the combination with a fire-pot having a solid floor inclined toward openings therein, of a retort interposed between said openings extending upwardly from the floor of said fire-pot and provided with means for emitting gas from the interior thereof through the side walls, and means for introducing into said retort combustibles capable of generating gas.

4. In a heating system, the combination with a fire-pot having a solid floor inclined toward openings therein, of a retort interposed between said openings extending upwardly from the floor of said fire-pot and provided with means for emitting gas from the interior thereof through the side walls, and means for supplying combustibles through the bottom of said retort.

5. In a heating system, the combination of a fire-pot provided with means for supplying air to said fire-pot through its side walls and having a solid floor inclined toward openings through which the ashes may be ejected, a central retort for said fire-pot provided with perforations in its side walls for the emission of gas from the interior thereof, and means for supplying combustibles through the bottom of the retort.

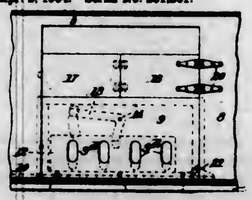
811,090. SUSPENDER-HOOK. FREDERICK A. RITCHIE, St. John, Canada. Filed May 16, 1904. Serial No. 208,302.

Claim.—1. In a device of the character described, a suspender-end having at its lower terminal a slotted tab, in combination with a tubular sheet-metal clamp located on the end and having a hook bent upwardly from the material of said clamp.

2. In a garment-supporter, the combination with a suspender-end terminating in an eye, of a clasp embracing the end directly adjacent to the eye, and an upstanding garment-engaging hook carried by the clasp and extending longitudinally of the end.

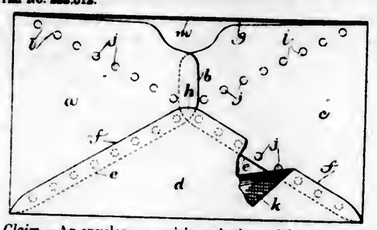
3. In a garment-supporter, the combination with a suspender-end having a terminal eye, of a supporting device formed of sheet metal and comprising a loop element composed of oppositely-extending clasp-wings that embrace the end relatively above the eye, and an upstanding garment-engaging hook element carried by the loop element.

811,091. GRAIN-CAR DOOR. CORNELIUS L. ROGERS, Pekin, Ill. Filed Apr. 2, 1904. Serial No. 201,301.



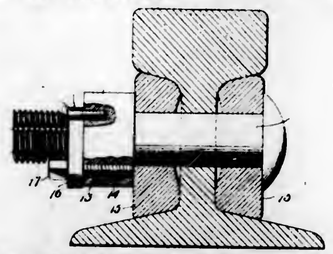
Claim.—The combination in a grain-car door, of a lower sliding door, and an upper door formed of sections hinged together, said upper door being hinged to the door-post by rising hinges and adapted to drop when closed upon the upper edge of the sliding door.

811,092. SAFETY-ENVELOP. HENRY P. ROBERTS, Boston, Mass., assignor to Charles F. Howe, Boston, Mass. Filed Aug. 29, 1904. Serial No. 223,512.



Claim.—An envelop comprising a body, end flaps, and a bottom flap, and a main sealing-flap, the end flaps being provided with a series of tongues lying wholly within the edges of the flaps and entirely covered by the bottom flap and main sealing-flap when said flaps are sealed onto the end flaps, the said tongues being united to the envelop by narrow necks materially less in section than the section of the tongues, and the tongues being so disposed that the alternating tongues project in opposite directions.

811,093. LOCK-NUT. WILLIAM L. ROBERTS, Norfield, Miss. Filed Aug. 7, 1905. Serial No. 273,092.



Claim.—1. In a nut-lock the combination with a bolt having a plurality of spaced channels disposed transversely of its threads, a nut engaging the threaded end of the bolt and provided with a threaded aperture extending entirely through the nut parallel to the bolt-receiving aperture therein, a set-screw engaging said threaded aperture and bearing against the face of the structure upon which the nut bears, and a detent swinging upon the outer end of said set-screw and engaging said bolt-channels one at a time by its free end, the detent being clamped in position upon the nut and the nut being clamped in position upon the structure upon which it bears by the action of the set-screw.

2. In a nut-lock the combination with a bolt having a plurality of spaced channels disposed transversely of its threads, a nut engaging the threaded end of the bolt and provided with a threaded aperture extending entirely through the nut parallel to the bolt-receiving aperture therein, a set-screw engaging said threaded aperture and bearing against the face of the structure upon which the nut bears, a detent swinging upon the outer end of said set-screw and engaging said bolt-channels one at a time by its free end, and a stop-pin adapted to be inserted in said nut rearwardly of said detent when the detent is in engagement with the bolt.

811,094. MATTRESS. WILLIAM ROBERTSON, Chicago, Ill. Filed Oct. 17, 1904. Serial No. 228,843.

Claim.—1. A mattress comprising a core consisting wholly or in part of electrically-conducting material, a layer of fabric such as felt inclosing said material, a covering fabric investing the same, and an electrical conductor embedded in said conducting material.

2. A mattress comprising a central mass of fine resilient long metal shavings, a thin layer of felt covering the same, an investing fabric such as ticking affording a cover, an electrical conductor in

contact with said shavings, and means projecting through the investing material adapted to convey electricity to the patient treated.

4. In a filling and packing machine, the combination with a plunger or rammer, of means for supplying filling material to the ar-

two-part mold, of a transverse bar rigidly held in position, and means for clamping said mold to said bar.

Claim.—1. A telephone-transmitter comprising a front plate composed of two sheet-metal parts pressed into the desired shapes

contact with said shavings, and means projecting through the investing material adapted to convey electricity to the patient treated.

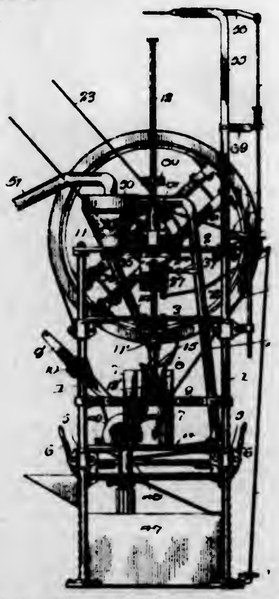
3. A mattress comprising a central mass of incombustible conducting material, an inclosing fabric therefor, an electrical conductor extending through said fabric into said material, a conducting-sheet and a plurality of points thereon adapted to project into said material.

4. A mattress comprising a filling consisting wholly of non-combustible, electrically-conducting material, and means for passing an electric current through said material.

5. A mattress comprising a central core of non-combustible electrical conducting material, an absorbent covering therefor, a tick inclosing said material and covering, an electrical conductor embedded in said material and projecting through the tick, a conducting-sheet and a plurality of contact-points thereon adapted to project through the tick into said conducting material.

6. In a device of the class described the combination with a central core of metallic shavings, of a covering therefor, an electrical conductor embedded in said shavings and projecting through said coverings, a plurality of electrical conductors adapted to project through the covering into contact with said shavings and a flexible sheet having a plurality of points thereon and suspended above said core.

811,095. **MACHINE FOR STUFFING CUSHIONS.** ALBERT L. ROOP and FANNIE C. ROOP, Philadelphia, Pa. Filed Dec. 12, 1904. Serial No. 236,416.



Claim.—1. In a filling and packing machine, the combination with means for inserting the material into the article to be filled, of means for stopping said machine when the material has reached a certain height in said article.

2. In a filling and packing machine, the combination with a plunger or rammer, means for supplying material to the article to be filled, and means for stopping the machine when the material has reached a certain height.

3. In a filling and packing machine, the combination with a reciprocating plunger or rammer, of means for supplying material to the article to be filled, and means engaging said plunger or rammer to stop the machine when the material has reached a certain height.

4. In a filling and packing machine, the combination with a plunger or rammer, of means for supplying filling material to the article to be filled, and means located in the path of said plunger or rammer for stopping the machine when the material has reached a certain height.

5. In a filling and packing machine, the combination with a plunger or rammer, of means for supplying material to the article to be filled, a belt-shifter, and means engaging said plunger for operating said belt-shifter to stop the machine when the material has reached a certain height.

6. In a filling and packing machine, the combination with a plunger or rammer, of means for supplying filling material, a lever, one end of which is located in the path of said plunger or rammer, a belt-shifter, and means connecting said lever with said belt-shifter for stopping the machine when the material has reached a certain height.

7. In a filling and packing machine, the combination with a plunger or rammer, of means for supplying material to the article to be filled, a spring-controlled belt-shifter, a catch connected with said belt-shifter, and means operated by said plunger for releasing said catch when the filling material has reached a certain height.

8. In a filling and packing machine, the combination with a plunger or rammer, and means for supplying material to the article to be filled, a spring-controlled belt-shifter, a catch operating upon said belt-shifter, a lever, one end of which is located in the path of said plunger, and connections between said catch and lever, whereby the machine is stopped when the material has reached a certain height.

9. In a filling and packing machine, the combination with means for filling the article to be filled, driving mechanism, a brake operating upon said driving mechanism, and means connected with said filling means and said brake for operating said brake when the filling material has reached a certain height.

10. In a filling and packing machine, the combination with a plunger or rammer, of driving mechanism, a machine-brake operating upon said driving mechanism, and means operated by said plunger and connected with said brake for applying the latter when the filling material has reached a certain height.

11. In a filling and packing machine, the combination with a plunger or rammer, of driving mechanism, means for shutting off the power of said driving mechanism, said means being operated by said plunger, a machine-brake for said driving mechanism, and connections between said means for shutting off the power and said brake for applying the latter to stop the machine.

12. In a filling and packing machine, the combination with a plunger or rammer, of driving means for shutting off the power when the filling material has reached a certain height, a machine-brake acting upon said driving mechanism, and connections between the means for shutting off the power and said brake for operating the latter to stop the machine.

13. In a filling and packing machine, the combination with a plunger or rammer, driving mechanism, a belt-shifter for said driving mechanism, means between said belt-shifter and said plunger for operating said belt-shifter when the material has reached a certain height, machine-brake acting upon said driving mechanism, and means carried by said belt-shifter for operating said brake.

14. In a filling and packing machine, the combination with a plunger or rammer, of driving mechanism therefor, a belt-shifter for said driving mechanism, actuated by said plunger, a brake acting upon said driving mechanism, a cam-plate carried by said belt-shifter, a spring, and connections between said cam-plate and said spring for operating the latter to stop the machine.

15. In a filling and packing machine, the combination with a plunger or rammer, driving mechanism therefor, a spring-controlled belt-shifter operating upon said driving mechanism and operatively connected with the said rammer, a machine-brake upon said driving mechanism, a cam-plate carried by said belt-shifter, and means between said cam-plate and said brake for operating the latter to stop the machine.

16. In a filling and packing machine, the combination with a plunger or rammer, of driving mechanism therefor, a spring-controlled belt-shifter for said driving mechanism, a latch for holding said belt-shifter in its normal position to operate the machine, a cam-plate carried by said belt-shifter, a machine-brake acting upon said driving mechanism, and connections between said brake and said cam-plate for operating said brake.

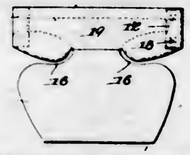
17. In a filling and packing machine, the combination with a device for engaging the article to be filled, of a transverse bar rigidly held in position, and means for clamping said device to said bar.

18. In a filling and packing machine, the combination with a two-part mold, of a transverse bar rigidly held in position, and means for clamping said mold to said bar.

19. In a filling and packing machine, the combination with a two-part mold, of a transverse bar rigidly held in position, a member pivoted to said bar, and means for producing pressure between the parts of said mold.

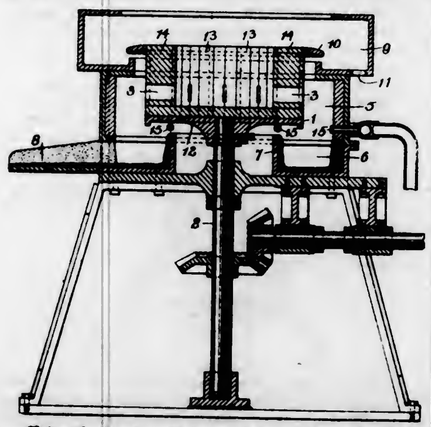
20. In a filling and packing machine, the combination with a two-part mold, of a transverse bar rigidly held in position, a clamping member pivoted to said bar, and a hand-screw carried by said member, and adapted to produce a pressure between the parts of said mold.

811,096. **NECK-MUFFLER.** JAMES C. SCOTT, Portsmouth, Ohio, assignor to Scott Muffler Co., Portsmouth, Ohio. Filed Feb. 1, 1905. Serial No. 243,714.



Claim.—A muffler comprising a central multi-ply neck-encircling portion, a single-ply chest-protecting flap separated therefrom through out a greater portion of its length by garment-receiving slits, facings carried by the terminals of the neck-encircling portion and having fastening devices combined therewith, and a single-ply narrow flap included between the plies of the neck-encircling portion and having its terminals engaged by the threads that combine the facings with the device.

811,097. **APPARATUS FOR TREATING MOLTEN METAL.** JOSEPH S. SEAMAN, Pittsburg, Pa. Filed May 23, 1904. Serial No. 209,311.



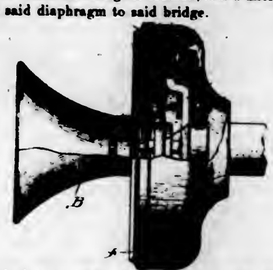
Claim.—1. An apparatus for treating metal having in combination an open-topped rotatable basin having radial ports or passages in its side wall, a receiving vessel inclosing the basin and provided with a spout and a catch-basin surrounding the upper portion of the separating-basin, substantially as set forth.

2. An apparatus for treating metal having in combination, a basin having removable wall-sections provided with ports or passages, means for rotating said basin, a receiving vessel surrounding the basin and provided with a spout, substantially as set forth.

3. An apparatus for treating molten metal having in combination a rotatable basin having radial ports or passages, a receiving-receptacle surrounding the basin and having an outlet and blast-pipes arranged to direct jets of air against the metal in the receptacle, substantially as set forth.

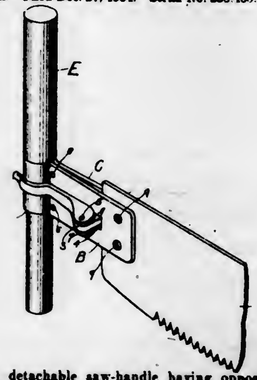
811,098. **TELEPHONE-TRANSMITTER.** MICHAEL SHIVER, Chicago, Ill., assignor to American Electric Telephone Company, Chicago, Ill., a Corporation. Filed Dec. 30, 1904. Serial No. 238,992.

Claim.—1. A telephone-transmitter comprising a front plate composed of two sheet-metal parts pressed into the desired shapes and rigidly secured together, one of said parts having an internally-threaded boss, a mouthpiece screwed into said boss, a diaphragm having its marginal portions resting against the other sheet-metal part, a bridge suitably secured to the sheet-metal part on which the diaphragm rests, a casing fitted upon the periphery of the sheet-metal part to which the bridge is secured, and a microphone device connecting said diaphragm to said bridge.



2. A telephone-transmitter comprising a front plate composed of two sheet-metal parts, one of said parts being pressed into such shape as to provide it with a hollow annular portion and a radially and inwardly projecting flange, and also with a peripheral bead or relatively narrow flange, and the other sheet-metal part being provided centrally with an internally-threaded boss and a peripheral flange pressed or reamed down upon the said bead or narrow flange of the other part; a mouthpiece screwed into said threaded boss, a diaphragm resting against the shoulder or seat provided by said inwardly-projecting flange, a bridge secured to said hollow annular portion, a microphone device connecting said diaphragm with the said bridge, and a casing fitted upon the said hollow annular portion of the front plate and bearing against the shoulder provided by the said pressed or reamed front portion of the front plate.

811,099. **DETACHABLE SAW-HANDLE.** JACOB L. SHEETS, Stella, Wash. Filed Dec. 27, 1904. Serial No. 238,450.

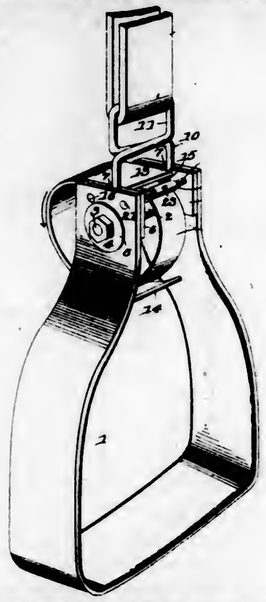


Claim.—A detachable saw-handle having oppositely-located saw-securing plates, integral at one end, free at the other, with studs on one plate adapted to pass through openings in a saw and in the opposite plate, and in particular, provided with a horizontally-operating cam-fastening lever D of suitable form and dimensions pivotally mounted on the outside of the plate B in a lug 3 which is fixedly secured to the inside of the plate C and adapted to freely pass through an opening in the plate B all substantially as described.

811,100. **SAFETY-STIRRUP.** FRANK T. SHIPTON, Kinsmanick, Ohio. Filed Aug. 5, 1905. Serial No. 272,898.

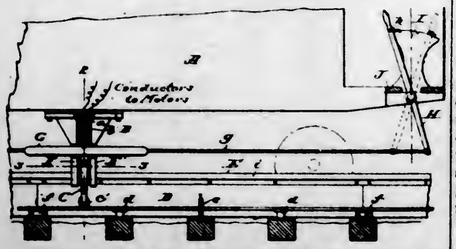
Claim.—1. A stirrup having the upper portion of its arms provided with oppositely-inclined seats and with slots alining with the seats, in combination with a loop having arms to engage the slots and inclined locking-toes to engage the seats, a pivoted detent to hold the arms within the slots, and means coacting with the detent to hold the parts in operative position.

2. A stirrup having its arms provided with oppositely-inclined seats and plates secured thereto and provided with slots alining with the seats, in combination with a loop having arms engaging the slots and provided with inclined locking-toes engaging the seats, a pivoted detent to hold the arms within the slots, and a spring combined with the detent for holding the parts in operative position.



3. The combination with a stirrup having its arms provided with oppositely-inclined seats, of plates secured to the inner sides of the arms and having slots alining with the seats, a loop having resilient arms to engage the slots and oppositely-inclined locking-toes to engage the seats, a pivoted detent having a part normally to engage with the arms, and having a curved tripping-arm disposed between the members of the stirrup, and a curved spring having one end combined with the stirrup and the other end secured to the tripping-arm.

811,101. **ELECTRIC SURFACE AND ELEVATED TROLLEY-RAILWAY.** CHARLES D. SMITH, Fond du Lac, Wis. Filed Mar. 2, 1903. Serial No. 145,849.



Claim.—1. The combination with a vehicle-body, of a frame depending therefrom, a vertical slot in said frame, a contact-arm adapted for vertical travel in said slot, an actuating-bar extending transversely through said frame, and inclined surfaces on said actuating-bar for engaging said contact-arm, whereby said arm may be raised.

2. The combination with a vehicle-body, of a frame depending therefrom, a vertical slot through said frame, a contact-arm adapted for vertical travel in said slot, a spring tending to push said arm downwardly, and an actuating-bar extending transversely through said frame, said bar being provided with inclined surfaces for engaging said contact-arm, whereby said arm may be raised against the pressure of said spring.

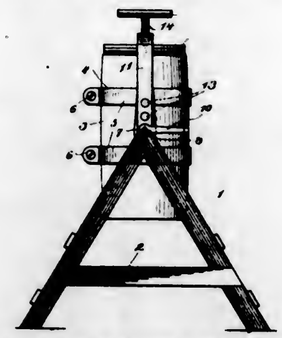
3. The combination with a vehicle-body, of a frame depending therefrom, a vertical slot through said frame, a contact-arm adapted for vertical travel in said slot, a reduced shank portion on said arm, a spring encircling said shank portion and tending to press said arm downwardly, an actuating-bar extending transversely through said frame, inclined surfaces on said actuating-bar, and a roller on said arm for engaging said inclined surfaces, transverse movement of said actuating-bar with respect to said arm causing said arm to be raised.

4. The combination with a vehicle-body, of a frame depending therefrom, a vertical slot extending through said frame, a contact-arm adapted for vertical travel in said slot, a compression-spring in said slot interposed between said arm and said frame and tending to press said arm downwardly, a horizontal slot extending transversely through said frame and said vertical slot, an actuating-bar disposed in said horizontal slot, a roller on said contact-arm, inclined surfaces on said actuating-bar for engaging said roller, and levers on said vehicle associated with said actuating-bar, actuation of said levers causing said roller to travel over an inclined surface to cause said contact-arm to be raised.

5. The combination with a vehicle-body, of a frame depending therefrom, a vertical slot in said frame, a contact-arm adapted for vertical travel in said slot, a conductor for engaging with said contact-arm, and a horizontal actuating-bar having inclined surfaces for engaging said contact-arm, horizontal motion of said actuating-bar causing said contact-arm to be raised from the said conductor.

6. The combination of a vehicle-body, a frame depending therefrom, a vertical slot through said frame, a contact-arm having vertical travel in said slot, a contact-wheel at the lower end of said arm, a conductor, a compression-spring in said slot disposed between said arm and said frame for compressing said contact-wheel into engagement with said conductor, an actuating-bar extending transversely through said frame, a roller on said arm, and an inclined surface on said actuating-bar for engaging said roller to raise said arm from the conductor upon horizontal movement of said actuating-bar.

811,102. **CHURN.** JOHN G. SMITH, Kaltonburg, Tenn. Filed Aug. 4, 1905. Serial No. 272,695.



Claim.—In a device of the character described, the combination of two open bands and means for adjusting the same, side pieces connecting said bands together, journals carried by said side pieces, a cap or head engaging portion provided with perforations and arranged to be passed on the said journals on said side pieces, and a screw carried in said cap or head engaging portion arranged to engage the cap or head of the receptacle, substantially as described and for the purposes set forth.

811,103. **ROTARY ENGINE.** ALONZO B. STEVENS, Dallas Center, Iowa. Filed May 4, 1905. Serial No. 259,267.

Claim.—1. In a rotary steam-engine, a solid semicircular piston, having one square end and one outwardly curved, on a shaft in concentric position with a circular chamber having a second chamber communicating therewith and an abutment-valve in the second chamber to continuously engage the piston at each revolution as set forth.

2. In a rotary engine, a circular cylinder having a rectangular chamber communicating therewith, a driving-shaft in the center of the circular cylinder and a solid semicircular piston on the shaft to rotate within the circular chamber of the cylinder and one end of the piston square and the other end curved outwardly and an abutment-valve pivoted in the rectangular chamber to contact with the piston as the piston revolves in the circular chamber.

3. In a rotary engine, a circular cylinder having a rectangular chamber communicating therewith, a driving-shaft in the center of the circular cylinder and a semicircular piston, square at one end and curved outwardly at the other end, on the shaft to rotate within the circular chamber of the cylinder, an abutment-valve pivoted in the rectangular chamber to contact with the piston as the piston revolves in the circular chamber and a rotary valve connected with the rectangular chamber to admit steam into the rectangular chamber at each revolution of the shaft and piston.

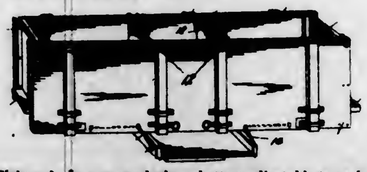
4. In a rotary engine, a circular cylinder having a rectangular chamber communicating therewith, a driving-shaft in the center of the circular cylinder and a semicircular piston, having a square shoulder at one end outwardly curved at the other end, on the shaft to rotate within the circular chamber of the cylinder, an abutment-valve pivoted in the rectangular chamber to contact with the piston and the hub of the piston as the piston revolves in the circular chamber, a rotary valve connected with the rectangular chamber to admit steam into the rectangular chamber at each revolution of the shaft and piston and means to actuate the rotary valve during an interval in each revolution of the shaft.

5. In a rotary engine, a circular cylinder having a rectangular chamber communicating therewith, a driving-shaft in the center of the circular cylinder and a semicircular piston, square at one end outwardly curved at its other end, on the shaft to rotate within the circular chamber of the cylinder, an abutment-valve pivoted in the rectangular chamber to contact with the piston and the hub of the piston as the piston revolves in the circular chamber, a rotary valve connected with the rectangular chamber to admit steam into the rectangular chamber at each revolution of the shaft and piston, a crank on the end of the rotary valve, an eccentric on the end of the driving-shaft and an arm pivotally connected with said crank and said eccentric to actuate the rotary valve during an interval in each revolution of the shaft.

6. A circular cylinder having a rectangular extension, a central partition to produce two circular steam-chambers and two rectangular steam-chambers, a driving-shaft in concentric position with the two circular chambers, a semicircular piston in each circular chamber fixed to the shaft and one end of each piston square and the other end curved outwardly, an abutment-valve pivoted in each rectangular chamber to engage a piston and means to alternately admit steam into the rectangular chamber.

7. In a rotary engine, a circular cylinder having an angular extension, a driving-shaft in the center of the circular portion of the cylinder, a piston having a square shoulder and also an outwardly-curved shoulder fixed to the shaft and an abutment-valve pivoted in the angular part of the cylinder to engage the piston as set forth.

811,104. **WAGON-BODY.** DAVID STEVENS, Ogden, Utah. Filed Apr. 5, 1905. Serial No. 254,613.



Claim.—1. In a wagon-body, a bottom adjustable to an incline at each end and provided with an opening adjacent the middle thereof, a laterally-extending, inclined chute beneath the opening and means for controlling the discharge of material from either end of the body through the opening and into the chute.

2. In a wagon-body, a bottom adjustable to an incline at each end and provided with an opening adjacent the middle thereof, a laterally-extending, inclined chute beneath the opening, means for adjusting the chute to extend upon either side and means for controlling the discharge of material from either end of the body through the opening and into the chute.

3. A wagon-body having three compartments arranged longitudinally, means provided in the middle compartment for opening the bottom thereof, means for raising the opposite ends of the bottoms of the end compartments and means to control the passage of material from the end compartments to the middle compartment and through the opening.

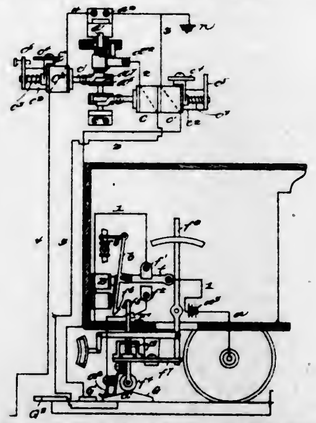
4. A wagon-body divided transversely by two hinged partitions into three compartments, means for raising the opposite ends of the bottoms of the end compartments, means for opening the bottom of the central compartment and means for controlling the flow of material from either end compartment into the central compartment by moving one hinged partition.

5. A wagon-body having an opening through the bottom adjacent the middle, a removable closure for said opening, two removable rods passing transversely across the body and through the sides, a partition pivotally mounted upon each of said rods and proportioned to contact with the bottom adjacent the sides of the opening and means for detachably securing the partitions in vertical positions to divide the body into three compartments.

6. A wagon-body having an opening through the bottom adjacent the middle, two removable rods passing transversely across the body and through the sides, a partition pivotally hinged upon each of said rods and proportioned to contact with the bottom adjacent the opening, means for holding the partition in a vertical position, means for raising the opposite ends of the bottom to form an incline from the opening to each end and means for swinging either of the partitions to control the flow of material from either end through the opening.

7. A wagon-body having an opening in the bottom and a closure for the opening forming a substantially plane surface with the bottom, partitions arranged and proportioned to be placed transversely across the body adjacent the opening and to form a central compartment, rods arranged to pass through the sides of the body and secure the partitions pivotally therein, means for raising the ends of the bottom forming an incline from adjacent the partitions and a chute disposed below the opening and extending laterally from the body.

811,105. **RAILWAY SIGNALING.** SAMUEL D. STRONG, Philadelphia, Pa. Filed Aug. 29, 1891. Serial No. 404,146.



Claim.—1. A railway having a plurality of stations, a circuit making and breaking device at each station controlling a safety appliance, two separate sets of oppositely-located contact-plates at each station, a normally closed partial circuit extending from one of the contact-plates of one set through the circuit-breaker of a distant station in advance of the same and adapted when operated to break the said partial circuit, a partial circuit extending from another contact-

plate of the same set through the same distant circuit-breaker and adapted when energized to further break the first partial circuit, a partial circuit extending from the third contact-plate of the same set to a circuit-breaker behind the same so as to reëstablish the same if broken, a normally closed partial circuit extending from one of the contact-plates of the other set to a circuit-breaker of a distant station behind the same and adapted when operated to break said partial circuit, a partial circuit extending from another contact-plate of the same set to the same distant circuit-breaker and adapted when energized to further break the first-mentioned partial circuit, a partial circuit extending from the third contact-plate of the same set to a circuit-breaker in advance of the same and adapted to restore the same if broken, a generator with connections, and circuit-making devices on a train making contact with either of said sets of contact-plates according to the direction of movement of the train, and thereby complete the corresponding partial station-circuits, substantially as set forth.

2. In a railway having a plurality of stations, the combination of a step-by-step circuit-breaking device at each station, two magnets or solenoids for operating the same, two contact-plates at each station, a partial circuit connected with one of said contact-plates and extending through one of said magnets or solenoids and adapted to be broken by said circuit-breaker, a safety device under the control of said circuit, a second partial circuit connected with the other of said contact-plates and extending through the other magnet or solenoid, a generator with connections and contact-making devices on a train making contact with said contact-plates to complete said partial circuits, and a switch controlled by the safety device for supplying current to the second partial circuit only when the safety device is operated, substantially as set forth.

3. In a railway having a plurality of stations, the combination of a step-by-step circuit-breaking device at each station, two magnets or solenoids for operating the same, two contact-plates at each station, a partial circuit connected with one of said contact-plates and extending through one of said magnets or solenoids and adapted to be broken by said circuit-breaker, a magnet B on the train and adapted to be looped in said partial circuit, a latch *b*, the position of which is controlled by said magnet, a hooked arm F adapted to be moved upward at each station and engaging with the latch *b* when the magnet B is deënergized, a safety device controlled by the latch *b*, a second partial circuit connected with the other of the contact-plates and extending through the other magnet or solenoid at the circuit-breaker, a generator with connections and contact-making devices on a train making contact with said plates to complete said partial circuits, and a switch connected to the latch *b* for supplying current to the second partial circuit only when said latch is operated, substantially as set forth.

4. In a railway having a plurality of stations, the combination of a step-by-step circuit-breaking device at each station, two magnets or solenoids for operating the same, two contact-plates at each station, a partial circuit connected with one of said contact-plates and extending through one of said magnets or solenoids and adapted to be broken by said circuit-breaker, a magnet B on the train and adapted to be looped in said partial circuit, a latch *b*, the position of which is controlled by said magnet, a hooked arm F adapted to be moved upward at each station and engaging with the latch *b* when the magnet B is deënergized, connections between said latch and the throttle-valve of an engine, a second partial circuit connected with the other contact-plate and extending through the other magnet or solenoid at the circuit-breaker, a generator with connections and contact-making devices on a train making contact with said plates to complete said partial circuits, and a switch connected to the latch *b* for supplying current to the second partial circuit only when said latch is operated, substantially as set forth.

5. In a railway having a plurality of stations, the combination of a circuit making and breaking device at each station having two magnets or solenoids for effecting the breaks, and a single magnet or solenoid for effecting the reverse movements of said device, and three contact-plates at each station with each of which a partial circuit connects, one of said partial circuits controlling the safety device and extending through one of the breaking magnets or solenoids which when operated will break said partial circuit, the second partial circuit extending through the other breaking magnet or solenoid so that a second train entering the block will further break the first-mentioned circuit, and the third partial circuit extending through the resetting magnet or solenoid of a distant station, a generator with connections and circuit-making devices on a train engaging said contact-plates to complete the corresponding partial station-circuits, substantially as set forth.

6. In a railway having a plurality of stations, the combination with a circuit making and breaking device at each station having two magnets or solenoids for effecting the breaks, and a single magnet or solenoid for effecting the reverse movements of said device, three contact-plates at each station with each of which a partial circuit connects, one of said partial circuits controlling the safety device and extending through one of the breaking magnets or solenoids, which when operated will break said partial circuit, the second partial circuit extending through the other breaking magnet or solenoid, so that a second train entering a block will further break the first-mentioned circuit, and the third partial circuit extending through the resetting magnet or solenoid of a distant station, and a generator with connections, of two contact-making devices on a train, one of which engages the first contact-plate to break the said first partial circuit whereby the safety device is operated and the other of which engages the second contact-plate, and a switch operated in connection with the safety device for supplying current to the second contact-plate only when the first circuit is broken, substantially as described.

7. In a railway having a plurality of stations, the combination with a circuit-making device at each station having two magnets or solenoids for effecting the breaks, and a single magnet or solenoid effecting the reverse movements of said device, three contact-plates at each station with each of which a partial circuit connects, one of said partial circuits controlling the safety device and extending through one of the breaking magnets or solenoids, which when operated will break said partial circuit, the second partial circuit extending through the other breaking magnet or solenoid, so that a second train entering the block will further break the first-mentioned circuit, and the third partial circuit extending through the resetting magnet or solenoid at a distant station, and a generator with connections of two contact-making devices on a train, one of which engages with the first contact-plate to break said first partial circuit, and the other of which engages with the second contact-plate, of a magnet B to be looped in the first partial circuit, a latch *b*, the position of which is controlled by said magnet, a hooked rod F adapted to be moved upward at each station for engaging the latch *b* when the magnet B is deënergized, and a switch *f* for cutting the second partial circuit into circuit with the source of supply when said latch is moved downward for actuating the safety device, substantially as described.

8. In railway signaling, the combination of a step-by-step circuit-breaker and a semaphore at each station, means for setting said semaphore, an electromagnetic latch for tripping the same, a tripping-circuit extending from a distant station to the circuit-breaker and in circuit with the magnetic tripping device of the semaphore when the parts of the circuit-breaker are in normal condition, and contact devices operated by the circuit-breaker for grounding said tripping-circuit when the circuit-breaker is not in normal condition, substantially as and for the purpose set forth.

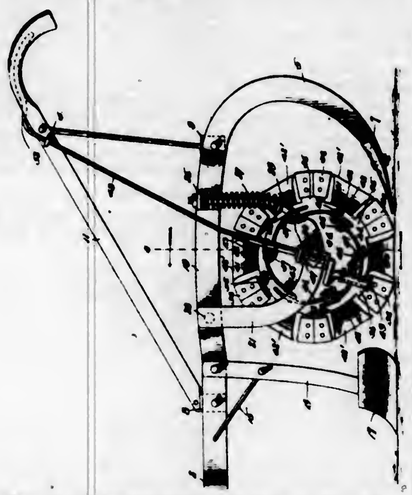
9. In railway signaling, the combination of a step-by-step circuit-breaker carrying two fingers K, K^3, which normally are in contact, a second finger K^4 with which the finger K^3 makes contact when the same is separated from the finger K, a semaphore at each station, means for setting the same, an electromagnetic tripping device for tripping said semaphore, a tripping-circuit extending in series with the fingers K^3, and K′, and with said tripping device, and a ground connected with said finger K^4 whereby when the circuit-breaker is in normal condition the tripping-circuit will extend through said tripping device, while if the said circuit-breaker is not in normal condition the said tripping-circuit will be grounded and will not affect the tripping device, substantially as set forth.

10. A railway having station electromagnetic devices, contact-plates and circuit connections, a semaphore, electromagnetic devices for setting the semaphore to one position, separate locking mechanism for holding said semaphore in said position, electromagnetic devices for releasing said locking devices for returning said semaphore to normal position, said electromagnetic locking and releasing devices being included in the circuits of the station-electromagnets, substantially as set forth.

11. In combination with station electromagnetic circuit connections for automatically stopping a railway train or engine, a semaphore, electromagnetic devices included in said circuit connections for setting the semaphore to a signaling position, locking devices for holding it in said position, and electromagnetic devices included in said circuit connections for releasing said locking devices and restoring the semaphore to normal position, substantially as set forth.

12. A station electromagnetic appurtenance comprising a magnet having a circuit-breaker, a second electromagnet having a circuit-breaker, the former or first-named magnet acting to open both circuit-breakers simultaneously, and the second-named magnet to correspondingly close the same, one of said breakers when opened automatically making a separate ground connection for said magnet, substantially as set forth.

811,106. **COTTON-CHOPPER.** WILLIAM H. SUTTON, Camden, Ark., assignor of one-half to John T. Swank, Camden, Ark. Filed June 17, 1905. Serial No. 265,795.



Claim.—1. A chopper-carrying drum having radial earth-engaging blades, and chopping elements movable between said blades.

2. A chopper-carrying drum having radial earth-engaging blades, and chopping elements movable between alternate pairs of blades.

3. A chopper-carrying drum having radial earth-engaging blades, and chopping elements movable between said blades in a plane parallel to the axis of the drum.

4. In a cotton-chopper, a member movable transversely of the row of plants and having a plurality of chopping elements connected therewith.

5. In a cotton-chopper, a drum supported for rotation, a member supported slidably by the drum, and a plurality of chopping elements connected with said member.

6. In a cotton-chopper, a drum supported for rotation and having radial earth-engaging blades, in combination with a member supported slidably by said drum to move transversely of the row of plants, and a plurality of chopping elements connected with said member.

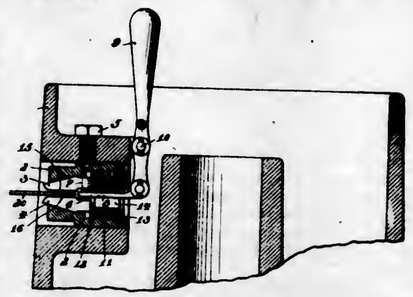
7. In a cotton-chopper, a drum supported for rotation and having radial earth-engaging blades, a spring-actuated member supported slidably by the drum, a plurality of chopping elements connected with said member to operate between two of the earth-engaging blades, and means for forcing said member against the action of its actuating-spring.

8. A drum supported for rotation and having radial earth-engaging blades, a member supported slidably by said drum to move transversely of the row of plants, a plurality of chopping elements connected with said member, a spring engaging said member to move it in one direction, a lever pivoted upon the drum and having pivotal connection with the sliding member, and movably-supported operating means for said lever.

9. A frame, resiliently-supported hangers pivoted upon said frame, a shaft supported by the hangers, a drum mounted for rotation upon the shaft, chopper-carrying spring-actuated rods supported slidably in the drum, levers pivoted upon the latter and having pivotal engagement with the rods, a yoke pivoted upon the drum-carrying shaft, and a rock-shaft having a bearing in the yoke and having a terminal crank carrying a roller.

10. A frame having outwardly-offset portions, hangers pivotally connected therewith one of said hangers being provided with an offset portion whereby it is spaced from the body of the frame at the pivotal connecting-point, a drum supported in the hangers, chopper-carrying members supported by said drum for sliding movement parallel to the axis thereof, and operating means for said chopper-carrying members supported upon the side of the drum adjacent to the hanger having the offset pivotal member.

811,107. **GRIPPING MEANS FOR WIRE-DRAWING DEVICES.** HUGH L. THOMPSON, Waterbury, Conn. Filed May 24, 1905. Serial No. 262,070.



Claim.—1. In a wire-drawing machine, the combination of a block, and gripping mechanism therefor comprising journaled elements having wire-engaging faces in planes at right angles with the axes of their rotation and having axes of rotation substantially parallel with the axis of the block.

2. In a wire-drawing machine, the combination of a block, and gripping mechanism connected therewith comprising journaled elements movable to and away from each other in lines parallel with the axes of their rotation, and having axes of rotation substantially parallel with the axis of the block.

3. In a wire-drawing machine, the combination of a block, gripping-jaws secured thereto, a wire-engaging element journaled in each jaw, said elements having axes of rotation substantially parallel with the axis of the block.

4. In a wire-drawing machine, the combination of a block, a pair of coöperating gripping-jaws secured to said block, each provided with a journaled element having an engaging face slightly above the surrounding surface of the jaw, said journaled elements having axes of rotation substantially parallel to the axis of the block.

5. In a wire-drawing machine, the combination of a block, and gripping mechanism connected therewith comprising a pair of gripping-jaws, means for moving said jaws toward and away from each other, and coöperating oppositely-disposed rotatable wire-engaging elements seated in and having ball-bearing relation with said jaws, the said rotatable elements having axes substantially parallel with the axis of the block.

6. In a wire-drawing machine, the combination of a block, and gripping mechanism connected therewith comprising a pair of members sliding in convergent ways, coöperating oppositely-disposed rotatable elements for engaging the wire seated in said members, and manually-operative means for actuating said members, the said rotatable elements having axes of rotation substantially parallel with the axis of the block.

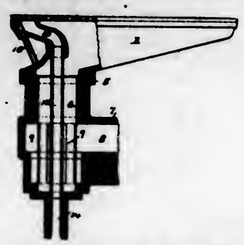
7. In a wire-drawing machine, the combination of a block having a recess in its peripheral surface, gripping mechanism disengageably secured in said recess comprising a casing having convergent ways, jaws sliding in said convergent ways provided with coöperating rotatable elements for engaging the wire, and manually-operative means for actuating said jaws, the rotatable elements having axes of rotation substantially parallel with the axis of the block.

811,108. **WRAPPER-SUPPORT FOR CIGAR-MACHINES.** OLOF TYBERG, New York, N. Y., assignor to International Cigar Machinery Company, New York, N. Y., a Corporation of New Jersey. Filed Sept. 13, 1904. Serial No. 224,269.

Claim.—1. The combination with a wrapper-support, of means for retaining a wrapper on the support, said means being arranged to operate on the tip and body of the wrapper, and means operating upon the under side of the tip to force it away from the support against the action of the retaining means, substantially as described.

2. The combination with a wrapper-support, of suction mechanism operating to retain the wrapper thereon, said mechanism being arranged to operate upon the body and tip of the wrapper, and

means operating upon the under side of the tip of the wrapper to force it away from the support against the action of the suction mechanism, substantially as described.



3. The combination with a wrapper-support, of suction mechanism operating to retain a wrapper thereon, said mechanism being arranged to operate upon the body and tip of the wrapper, and a blast mechanism operating to force the tip of the wrapper away from the support against the action of the suction mechanism, substantially as described.

4. The combination with a wrapper-support provided with perforations underlying the body and tip of the wrapper, of suction-producing means in communication with said perforations, and means operating against the under side of the tip of the wrapper to force it away from the support against the action of the suction, substantially as described.

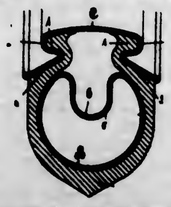
5. The combination with a wrapper-support provided with perforations underlying the body and tip of the wrapper, of suction-producing means in communication with said perforations, and a blast mechanism operating against the under side of the tip of the wrapper to force it away from the support against the action of the suction, substantially as described.

6. The combination with a wrapper-support provided with a suction-chamber and a blast-chamber, of perforations in the support underlying the body and tip of the wrapper, said perforations being in communication with the suction-chamber, and perforations in the support underlying the tip of the wrapper, said perforations being in communication with the blast-chamber, substantially as described.

7. The combination with a wrapper-support provided with a suction-chamber underlying that part of the support which carries the body of the wrapper and a blast-chamber underlying that part of the support which carries the tip of the wrapper, of perforations in that part of the support underlying the body of the wrapper, the said perforations being in direct communication with the suction-chamber, perforations in that part of the support which carries the tip of the wrapper, said perforations being in direct communication with the blast-chamber, and a pipe connecting with the suction-chamber, said pipe leading to one of the perforations which are in communication with the blast-chamber, substantially as described.

8. The combination with a wrapper-support having a suction-chamber and perforations in communication therewith said perforations forming a suction-producing field, of a blast-chamber and perforations communicating therewith, said perforations forming a blast-producing field, and means whereby the suction is caused to act upon the wrapper within the blast-producing field, and simultaneously with the action of the blast substantially as described.

811,109. PNEUMATIC TIRE. FRIEDRICH VIETH, Höchst-in-the-Odenwald, Germany. Filed Apr 20, 1905. Serial No. 257,971.

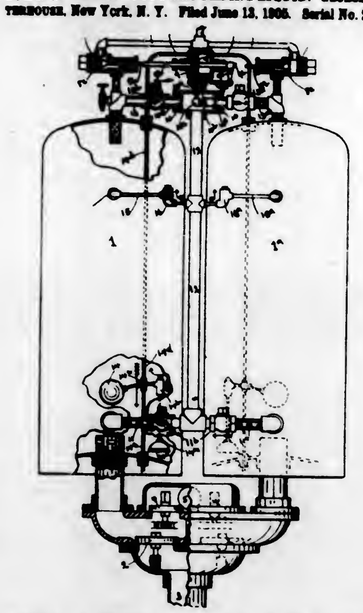


Claim.—1. A pneumatic tire consisting of a cover of a cross-section in the shape of a horseshoe and an india-rubber tube, of which an inner portion normally projects outwardly into its cavity, so that on inflating the tube this inner portion will project inwardly.

2. In a pneumatic tire, the combination with a wheel-rim having two opposite annular recesses, of a cover of a cross-section in the shape of a horseshoe, the inner edges of which are provided with two flanges for engaging in the annular recesses of said wheel-rim, and an india-rubber tube, of which an inner portion normally projects outwardly into its cavity, so that on inflating the tube this inner portion will project inwardly and fill up the space between said wheel-rim and the flanges of said cover.

3. In a pneumatic tire, the combination with a wheel-rim having two diverging conical portions and two opposite annular recesses behind them, of a cover of a cross-section in the shape of a horseshoe and having two shoulders and two flanges on its inner edges, the shoulders being adapted to rest on the conical portions of said wheel-rim and the flanges being adapted to engage in the annular recesses thereof, and an india-rubber tube of a circular cross-section, of which an inner portion normally projects outwardly into its cavity, so that on inflating the tube this inner portion will project inwardly and fill up the space between said wheel-rim and the flanges of said cover.

811,110. APPARATUS FOR PUMPING LIQUID. GEORGE L. WATERHOUSE, New York, N. Y. Filed June 13, 1905. Serial No. 264,994.



Claim.—1. An apparatus of the character described comprising a plurality of receptacles provided with liquid induction and eduction means, means for controlling the flow of steam to each receptacle to accord with the rise and fall of liquid therein, means for discharging heated fluid from the lower interior of one receptacle into the upper interior of another receptacle upon a charge of liquid therein before steam is admitted thereto, and means for causing condensation of steam in said receptacles after liquid has been discharged therefrom, substantially as described.

2. An apparatus of the character described comprising a plurality of receptacles provided with liquid induction and eduction means, means for controlling the flow of steam to each receptacle to accord with the rise and fall of liquid therein, means for discharging heated fluid from the lower interior of one receptacle into the upper interior of another receptacle upon a charge of liquid therein before steam is admitted thereto, and means for causing the flow of condensing fluid from one receptacle into the other after liquid has been discharged from the latter, substantially as described.

3. An apparatus of the character described comprising two receptacles provided with liquid induction and eduction means, means for controlling the flow of steam to each receptacle to accord with the rise and fall of liquid therein, means for discharging heated fluid from the lower interior of one receptacle into the upper interior of the other receptacle upon a charge of liquid therein before steam is admitted thereto, means for causing the flow of condensing fluid from one receptacle into the other after liquid has been discharged from the latter, and means for stopping the flow of condensing liquid to each receptacle after it has been charged with liquid to a substantially predetermined high level therein, substantially as described.

4. An apparatus of the character described comprising a plurality of receptacles provided with liquid induction and eduction means, means for alternately admitting steam to and shutting it off from each receptacle, means for discharging heated liquid from the lower interior of each receptacle to the upper interior of another receptacle before live steam is admitted thereto, means for condensing the steam in each receptacle, and means for preventing the rise of liquid in each receptacle above a substantially predetermined high level therein, substantially as described.

5. A pumping apparatus comprising a pair of receptacles provided with liquid induction and eduction means, means to alternately admit steam to each receptacle, means to alternately discharge heated surface liquid and steam from each receptacle to the other while live steam is shut off from the receptacle receiving such heated surface liquid, and means to alternately cause condensation of steam in said receptacles, substantially as described.

6. A pumping apparatus comprising a pair of receptacles provided with liquid induction and eduction means, valves to admit steam to said receptacles, means to open said valves alternately and leave both valves closed for a period of time, passages connecting the lower interior of each receptacle with the upper interior of the other receptacle, means to control the flow of fluid through said passages and to open the passage from one receptacle to another while steam is shut off from both receptacles, substantially as described.

7. A pumping apparatus comprising a pair of receptacles provided with liquid induction and eduction means, valves to admit steam to said receptacles, means to open said valves alternately and leave both valves closed for a period of time, passages connecting the lower interior of each receptacle with the upper interior of the other receptacle, means to control the flow of fluid through said passages comprising devices to open the passage from one receptacle to another while steam is shut off from both receptacles and to close the passage into one receptacle while live steam is entering the other receptacle, and means for condensing liquid in said receptacles; substantially as described.

8. A pumping apparatus comprising a pair of receptacles provided with liquid induction and eduction means, valves for admitting steam to said receptacles, means to alternately operate said valves and leave them both closed for a period of time, a passage connecting the lower interior of each receptacle with the upper interior of the other receptacle and provided with valves to prevent the return flow from one receptacle to the other, and a valve device to control the flow of fluid through said passage to each receptacle arranged to open the passage from one receptacle to the other while live steam is shut off from the last-named receptacle, the steam-valve-operating means serving to admit steam to the last-named receptacle after heated fluid from the other receptacle has entered the same, substantially as described.

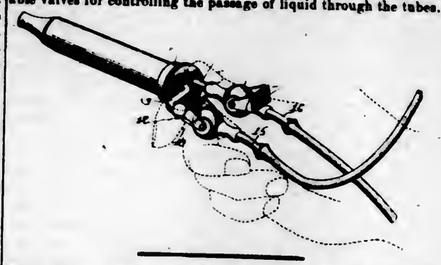
9. A pumping apparatus comprising a pair of receptacles provided with liquid induction and eduction means, valves to admit steam to said receptacles, passages connecting the lower interior of each receptacle with the upper interior of the other receptacle, valves to prevent the return flow through said passages from one receptacle to the other, a valve device to control the flow of heated fluid through said passages from one receptacle to the other, mechanism for operating the steam-valves connected with said valve device for operating the latter, and means for causing said mechanism to operate to alternately control the flow of steam to said receptacles to accord with the rise and fall of liquid therein; substantially as described.

10. An apparatus of the character described comprising a plurality of receptacles provided with liquid induction and eduction means, means for controlling the flow of steam to each receptacle, means for discharging heated fluid from the interior of one receptacle into the interior of another receptacle upon a charge of liquid therein before steam is admitted thereto, and means for causing condensation of steam in said receptacles after liquid has been discharged therefrom, substantially as described.

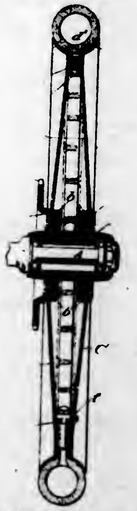
811,111. SYRINGE. GEORGE C. WEDEWARTH, Baltimore, Md. Filed Feb. 23, 1904. Serial No. 194,201.

Claim.—1. In a device of the class described, an outer imperforate shell or barrel, an induction-tube removably secured within the shell, and a peripherally-notched disk carried by the tube for centering it with relation to the shell.

2. In a device of the class described, an imperforate outer shell or barrel having its forward end open, a removable closure for the rear end of the shell, an induction-tube passing centrally through the closure and extending to the forward end of the shell, a peripherally-notched disk carried by the tube to center it relatively to the shell, an eduction-tube connected with the closure, and independently-operable valves for controlling the passage of liquid through the tubes.



811,112. AUTOMOBILE-WHEEL. EARL A. WHEELER and WILLIAM HECKERT, Sharon, Pa.; W. W. Shilling executor of said Earl A. Wheeler, deceased. Filed Dec. 29, 1904. Serial No. 238,766.



Claim.—1. A wheel having two separable half-rims which together constitute a complete grooved rim, an interposed ring to which said half-rims are secured, at least one of said half-rims being detachably connected to said ring, and a flexible tire fitted in said rim and attached to said ring by fastenings engaging the under portion of the tire.

2. A wheel comprising a hub, two confronting disks attached to said hub and having circumferential flanges or half-rims which together constitute a complete grooved rim for reception of a flexible tire, an interposed ring under said rim to which said disks are secured, at least one disk being detachably connected to its hub and to said ring, and means for fastening the tire to said ring comprising devices adapted for insertion through the ring and for attachment to the under side of the tire.

3. A wheel comprising two confronting sections separately secured together and having outwardly-flaring peripheral flanges or half-rims which when the sections are united constitute the complete grooved or concaved rim for reception of a cushion or flexible tire, and means for positively securing the tire in one half-rim before uniting the sections, the fastenings for the tire being concealed between the sections when united.

4. A wheel comprising two confronting sheet-metal sections having integral circumferential flanges or half-rims which together constitute a complete grooved rim for the reception of a flexible tire, and a ring under the tire between the sections to which the latter are

secured, one of said sections being affixed to said ring and the other detachably secured thereto and separable together with its half-rim to permit insertion or removal of the tire, and means for positively securing the tire to said ring before securing the removable section with its half-rim in place, said means comprising bolts or screws inserted through the ring and tapped in nuts embedded in the under medial portion of the tire.

5. A wheel whose body comprises two separable webs or disks having peripheral outwardly-flaring or concave flanges which when the sections are united constitute the complete grooved rim for reception of a flexible tire, a ring between the disks to which they are secured, and means for fastening the tire directly to said ring.

6. A wheel whose body comprises two separable webs or disks and an interposed ring to which they are secured, said disks having peripheral half-rims which together constitute a complete grooved rim, and a pneumatic tire seated in said rim and adapted to be inserted or removed by separating one disk with its half-rim from the other, said tire having a valved inflating-tube projecting from its under side through the rim into the space between the disks and having an opening through one of the disks for connection with a pump.

7. A wheel whose body comprises two separable webs or disks having integral peripheral half-rims which together constitute a complete grooved rim, and a pneumatic tire seated in said rim and adapted to be inserted or removed by separating one disk from the other, a ring under the tire to which said disks are separately secured, one of said disks being detachably secured thereto, and a valved inflating-tube projecting from the under side of said tire between the disks and having an opening through one of the disks for connection with a pump.

8. A wheel comprising a hub having annular flanges, opposite webs or sections secured to said flanges and having circumferential half-rims forming a grooved rim for reception of a flexible tire, and a ring under the tire between the sections and to which they are secured, at least one section being detachable, and means for positively fastening the tire to said ring before securing the detachable section in place.

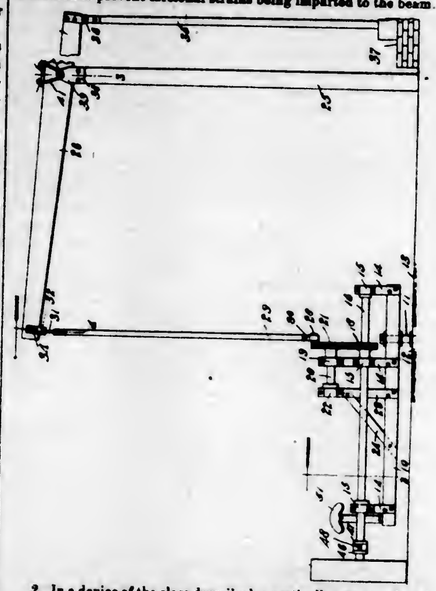
811,113. COMBINED BOTTLE-CAP AND CORK-PULLER. ROBERT C. WILSON, Athens, Ga. Filed Mar. 9, 1905. Serial No. 249,287.

Claim.—1. In a bottle-stopper, the combination of a bottle-neck having an outwardly-extending horizontal flange at its upper end and also having a horizontal, endless rib on the perimeter of said flange, a sheet-metal cap having an annular horizontal portion disposed above the flange of the bottle, teeth extending downwardly and inwardly from the inner edge of said portion and a flange depending from the outer edge of said portion and provided with a horizontal, endless swell snugly receiving the rib on the bottle-flange, and a cork resting in the bottle-neck and the cap and engaged by the teeth of the latter.

2. In a combined bottle-stopper and cork-puller, the combination of a cap the top of which is slitted radially to form teeth through which a cork is forced, the points of the teeth bending downward and biting into the cork to prevent its removal independent of the cap; said cap having a cylindrical wall depending from its said top, said wall being formed with a horizontal circumferential endless swell adapted to engage a rib upon a bottle; and a fermeture comprising a disk which closes the top of said cap and overlies said cork to exclude dust and air.

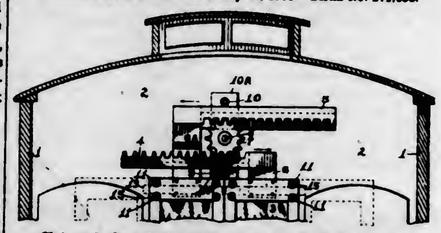
811,114. PUMP-JACK. FRANCIS M. YOUNG, San Angelo, Tex. Filed Dec. 2, 1905. Serial No. 289,622.

Claim.—1. In a device of the class described, a vertically-supported stud, a beam mounted for horizontal rotation upon said stud near the ground or other base upon which the device operates, spaced vertical standards carried by said beam and provided with shaft-bearings, a shaft mounted for rotation in said bearings and spaced above said beam, a combined traction and carrier wheel connected to the outer end of said shaft and bearing upon said base, means for connecting a draft appliance to said shaft and extending forwardly therefrom, and a driver's seat connected to said beam and extending rearwardly therefrom, whereby the weight of the operator is utilized to prevent torsional strains being imparted to the beam.



2. In a device of the class described, a vertically-supported stud, a beam mounted for horizontal rotation upon said stud near the ground or other base upon which the device operates, spaced vertical standards carried by said beam and provided with shaft-bearings, a shaft mounted for rotation in said bearings and spaced above said beam, a combined traction and carrier wheel connected to the outer end of said shaft and bearing upon said base, means for connecting a draft appliance to said shaft and extending forwardly therefrom, a driver's seat connected to said beam and extending rearwardly therefrom, a supporting-post spaced from said stud, a cap member carried by said post and having spaced ears, a pivot-pin disposed transversely through said ears, a walking-beam mounted for vertical movement upon said pin, a clamp-plate bearing upon said walking-beam above said pivot-pin, V-shaped clamp-bolts engaging said pivot-pin between said ears and walking-beam and passing through perforations in said clamp-plate, nuts engaging said bolts and bearing upon said clamp-plate, connecting means between one end of said walking-beam and said shaft whereby the rotation of the shaft is caused to reciprocate the walking-beam, and means for coupling a pump-rod to the other end of the walking-beam.

811,115. SLIDING DOOR FOR RAILWAY-CARS. FRED D. ACKERMAN, Hampton, Va. Filed July 28, 1905. Serial No. 271,696.

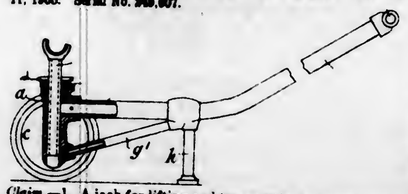


Claim.—1. In a device of the class described, the combination with double sliding doors, of plates fastened at the middle upper portion of said doors and having rack-bars of an L-shape cross-section and disposed at right angles to said plates, and rotary means for reciprocating said racks.

2. In a device of the class described, the combination with double sliding doors, of plates or webs secured to the doors of less width than the same and disposed at the center thereof, said plates or webs having rack-bars of L shape in cross-section and at right angles to the plates or webs, a gear-wheel between the racks adapted to reciprocate the same to open and close the doors together, rollers on one side of the doors, and independent H-shaped tracks for the rollers, one for each of the said doors.

3. In a device of the class described, the combination with double sliding doors, of a plate or web secured to the top of each door near its center, a rack-bar on each plate at right angles thereto extending above and beyond the said doors, a pinion between the racks for opening and closing one door by the other, one of the said rack-bars extending upon each side of the pinion, rollers on the plain surface of the racks for preventing vertical movement thereof, flanged rollers on each side of the doors, and tracks or guide-rails having an H shape in cross-section for supporting said rollers.

811,116. JACK FOR LIFTING AND TRANSPORTING MOTOR-CARS, &c. HENRY ADAMS, Tunbridge Wells, England. Filed Mar. 11, 1905. Serial No. 249,607.



Claim.—1. A jack for lifting and transporting motor-cars, carriages and the like, comprising a column, a carrier-frame supporting said column and mounted upon wheels, an axle-rest rotatably carried by said column, and means enabling said column to be tilted and also restored to its normal vertical position, as set forth.

2. A jack for the purposes aforesaid, comprising a tubular column, a carrier-frame supporting said column, wheels on said frame, a rotatable socket in said column, an axle-rest carried in said socket, and a lever-handle enabling said column to be tilted and restored to its normal vertical position, as set forth.

3. A jack for the purposes aforesaid, comprising a tubular column, a carrier-frame supporting said column, wheels on said frame, a rotatable socket mounted upon ball-bearings in said column, an axle-rest carried in said socket, a height-adjustment device for said column, a lever-handle, and a strut supporting said jack in its normal position, as set forth.

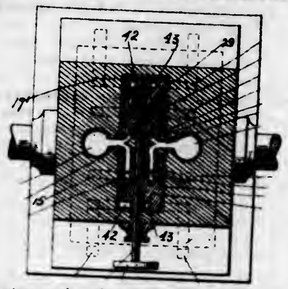
4. A jack for the purposes aforesaid, comprising a tubular column, a carrier-frame supporting said column and mounted on wheels, a tubular pillar adapted to slide in said column, a rotatable socket in said pillar, an axle-rest carried in said socket, a height-adjustment device for said rest, a nut engaging a screw-thread on said pillar, means rotating said nut when operated, a lever-handle, and a strut, as set forth.

5. A jack for the purposes aforesaid, comprising a tubular column, a carrier-frame supporting said column and mounted on wheels, a tubular pillar, a rotatable socket in said pillar, an axle rest carried in said socket, a height-adjustment device for said rest, a nut engaging a screw-thread on said pillar, ball-bearings for said nut, a bevel-wheel fixed to said nut, a bevel-pinion mounted in bearings in said carrier-frame, a tubular lever-handle fixed to said frame, a flexible shaft carried in said tubular lever-handle and fixed at one end to said bevel-pinion and at the other end to a suitable rotative means, and a strut, as set forth.

811,117. VALVE FOR ENGINES. THOMAS M. ANDERSON, Nashville, Tenn. Filed July 13, 1905. Serial No. 269,433.

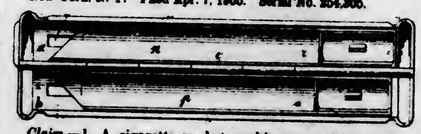
Claim.—1. In a rotary engine, the combination with a pair of cylinders provided with piston-carriers arranged on a common shaft, and each provided with a pair of inlet-ports and a pair of outlet-ports, of a single valve adapted when in one position to admit motor fluid to one of the inlet-ports of each cylinder, and to permit the motor fluid to escape from the corresponding outlet-port of each cylinder, and when in another position, to permit the motor fluid to enter the other inlet-ports of the cylinders and to escape from the corresponding outlet-ports.

2. In a rotary engine, the combination with a pair of axially-alined cylinders each provided with a pair of inlet-ports and a pair of outlet-ports, of a reciprocatory valve for each cylinder, a piston-carrier in each cylinder constructed and adapted to actuate in its rotation the corresponding reciprocatory valve, a rotatable valve arranged between said reciprocatory valves and to which the latter alternately admit the motive fluid, said rotatable valve being provided with a central aperture to which the steam is admitted and with passages leading from said central aperture and adapted to admit steam in one position of said valve to one of the said ports and the other inlet-port of each cylinder and in another position of said valve to admit steam into said last-mentioned inlet-port and exhaust steam from the other of said outlet-ports and said first-mentioned inlet-port.



3. In a rotary engine, the combination with a pair of axially-alined cylinders, a steam-chest above said cylinders, a valve-casing provided with exhaust-ports and passages communicating with said steam-chest, a pair of reciprocatory valves adapted to alternately open and close said passages, a piston-carrier in each cylinder provided with cam-surfaces adapted to actuate said valves, a rotatable valve within said casing provided with a central aperture to which the steam is admitted and with passages leading from said aperture and so arranged that in one position of said valve steam is admitted into one inlet-port and exhausted from the other inlet-port and one outlet-port of each cylinder and in the other position of said valve steam is admitted into said last-mentioned inlet-port and exhausted from the other inlet-port and the other outlet-port of each cylinder and manually-operable means to operate said valve.

811,118. CIGARETTE-MACHINE. FREDERICK F. ANDERSON, New York, N. Y. Filed Apr. 7, 1905. Serial No. 254,805.



Claim.—1. A cigarette pocket-machine comprising a hinged outer shell composed of two curved slotted halves having each a turned-up longitudinal edge and a half hollow rim at each end extending angularly in such a manner that the extended parts snap in when the machine is closed, and a cutter formed on one of the half hollow rims near the turned-up edges all stamped out of one sheet of metal, an inner shell, and means for sliding in and out the inner shell.

2. A cigarette pocket-machine comprising a hinged outer shell composed of two curved slotted halves having each a turned-up longitudinal edge and a half hollow rim at each end extending angularly in such a manner that the extended parts snap in when the machine is closed, and a cutter formed on one of the half hollow rims near the turned-up edges all stamped out of one sheet of metal, an inner curved shell consisting of two curved halves for making flat cigarettes and means for sliding in and out the inner shell.

3. A cigarette pocket-machine comprising a hinged outer shell composed of two curved slotted halves having each a turned-up longitudinal edge and a half hollow rim at each end extending angularly in such a manner that the extended parts snap in when the machine is closed, and a cutter formed on one of the half hollow rims near the turned-up edges all stamped out of one sheet of metal, an inner curved shell consisting of two curved halves for making flat cigarettes, knobs extending through the slots of the outer shell and secured each to a half of the inner shell.

4. A cigarette pocket-machine comprising a hinged outer shell composed of two curved slotted halves having each a turned-up longitudinal edge and a half hollow rim at each end extending angu-

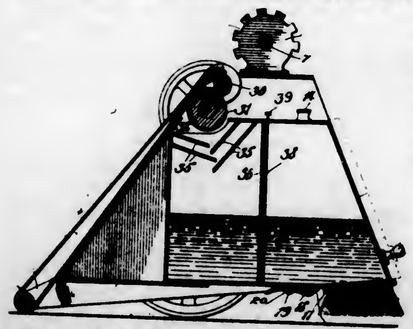
larly in such a manner that the extended parts snap in when the machine is closed, and a cutter formed on one of the half hollow rims near the turned-up edges all stamped out of one sheet of metal, an inner curved shell consisting of two curved halves for making flat cigarettes, knobs extending through the slots of the outer shell and secured each to a half of the inner shell, and two stoppers one secured to the inner portion of each knob.

5. In a cigarette pocket-machine an outer shell composed of two curved halves having each a longitudinal slot and a turned-up longitudinal edge, a half hollow rim at each end extending angularly in such a manner that the extended portions snap in when the machine is closed, a cutter formed on one of the hollow rims near the turned-up edges all stamped simultaneously out of one sheet of metal, and means within said inner shell for compressing the tobacco.

6. In a cigarette pocket-machine an outer shell composed of two curved halves, having each a longitudinal slot and a turned-up longitudinal edge, a half hollow rim at each end extending angularly in such a manner that the extended portions snap in when the machine is closed, a cutter formed on one of the hollow rims near theturned-up edges all stamped simultaneously out of one sheet of metal, and means within said outer shell for compressing the tobacco in flat shape.

7. In a cigarette pocket-machine an outer shell composed of two curved halves, having each a longitudinal slot and a turned-up longitudinal edge, a half hollow rim at each end extending angularly in such a manner that the extended portions snap in when the machine is closed, a cutter formed on one of the hollow rims near the turned-up edges all stamped simultaneously out of one sheet of metal, means within said outer shell for compressing the tobacco in flat shape, and a stopper attached to a half outer shell and extended over the front opening of the machine.

811,119. **MEANS FOR CLEANING FLOORS.** FREDERICK F. ANDERSON, New York, N. Y. Filed Feb. 19, 1904. Serial No. 194,341.



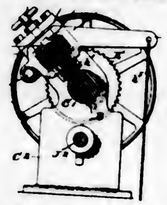
Claim.—1. In a device of the class described, a frame and brush attached beneath the same, a water-tank above said brush, a valve beneath the tank, a single propelling-handle rotatably mounted on said frame and a mechanical connection between said handle and said valve for opening and closing the valve by movement of the handle, substantially as described.

2. In a device of the class described, a frame, a brush pivoted beneath said frame, a water-tank above said brush supported by said frame, a valve beneath said tank, a propelling-handle for the frame rotatably mounted thereon, a spring for closing the valve, a pin on the handle and a flexible connection between said pin and said valve whereby turning the handle on its own axis will act to open and close said valve, substantially as described.

3. In a device of the class described, a frame, a brush carried beneath the frame, a tank supported by the frame above said brush, a valve beneath said tank and a propelling-handle; in combination with wheels supporting said frame, a roller near the bottom of the frame and extending to each side as far as the planes of said wheels, two corresponding rollers each of varying cross-section pivoted near the top of the frame over said tank, means connecting the supporting-wheels with one of said last-named rollers for driving the same and an endless band of absorbent material as wide as said lower roller supported by and running on all three rollers so as to spread out near the bottom of the frame, and be contracted within narrower limits near the top thereof, substantially as described.

4. In a device of the class described, a frame, a tank supported by said frame, a valve beneath the tank, a brush supported under one end of the frame near said valve a roller extending across and supported by said frame at its opposite end, a single pair of supporting-wheels for the frame between said brush and said roller, rollers supported by the frame above said tank, means connecting the supporting-wheels and one of said last-named rollers for driving the latter, an endless band of absorbent material passing over the first-named roller and over the last-named rollers, and a propelling-handle for the frame said supporting-wheels extending below the plane of the brush and lower roller so that the frame may be tipped on said supporting-wheels by means of said handle to bring said brush or said band in contact with the floor at will, substantially as described.

811,120. **COLLAR AND CUFF SHAPER.** WILLIAM M. BARNES, Philadelphia, Pa. Filed June 27, 1901. Serial No. 66,291.



Claim.—1. In a collar and cuff shaping machine, in combination, a pair of rollers, one above the other, a shaft for the upper roller, a frame having a slotted portion, a bearing within the slotted portion of said frame, said bearing being adapted to oscillate therein, a spring supporting said bearing and a set-screw above said bearing, said bearing being adapted to support the end of the upper roller-shaft remote from said roller.

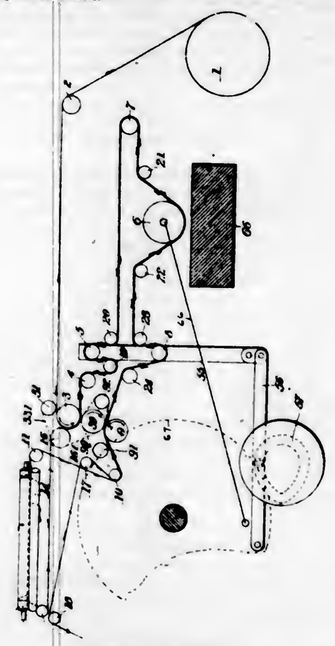
2. In a collar and cuff shaping machine, in combination a pair of rollers one above the other, a shaft for the upper roller, said shaft being supported at its end remote from the roller so as to be adapted to oscillate, and supported at its end adjacent the rolls in a bearing sliding in the framework of the machine, a pivoted frame surrounding said bearing adjacent the rolls, a spring normally holding said bearing and frame in raised position and the upper roller free from the lower roller, a lever projecting from said frame, a rod projecting from said lever whereby, on the movement of said rod, the frame is moved to bring the upper roller in contact with the lower roller.

811,121. **WEB-MANIPULATING MECHANISM.** HENRY F. BECHMAN, Battlecreek, Mich., assignor to The Duplex Printing Press Company, Battlecreek, Mich. Filed May 24, 1904. Serial No. 209,535.

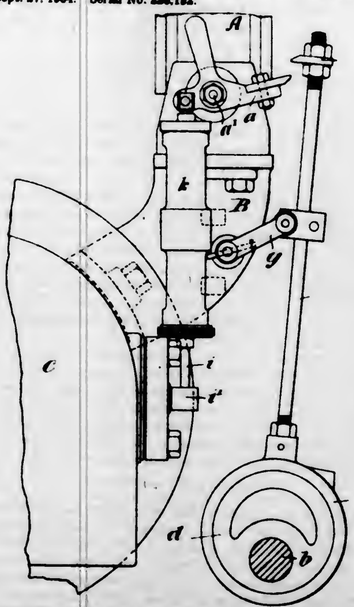
Claim.—1. In combination, a stationary type-bed, an impression-cylinder and means for rolling the cylinder back and forth over the bed, means for feeding a narrow web twice into the press, and means for delivering such web twice from the press, and looping devices for intermittently shifting the part of the web in the press between the feeding and delivering mechanisms through the printing devices; with means for guiding a narrow-width web twice through the press between the feeding and delivering devices; with means for deflecting the web to one side, between the points where it first leaves the delivery and where it enters the feed devices a second time, substantially as described.

2. In combination, a stationary bed and reciprocating cylinder for printing upon a web, and means for reciprocating the cylinder; means for continuously feeding web to said printing means, means for delivering the web from said printing means, and web-looping mechanism for intermittently shifting the web between said feeding and delivery mechanisms; with a web-deflector adjacent to the feeding and delivering mechanisms by which the web after passing once through the machine is deflected to one side, and again directed to the feeding mechanism and through the machine in a plane parallel with its first travel therethrough, substantially as described.

3. In a printing-press the combination of a web-printing couple comprising a stationary bed and a reciprocating impression-cylinder, and means for reciprocating the cylinder, a single continuously-acting means for feeding web into the press, a single means for continuously delivering web from the press, and a set of looping devices adapted to intermittently shift the portions of web in the press between the feeding and delivering mechanism through the printing devices; with means for directing a narrow-width web twice through the printing-couple, and means for deflecting the web to one side after it first leaves the press delivery mechanism and directing it a second time into the feeding mechanism and through the press, substantially as described.

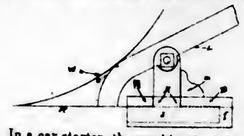


811,122. **SPARKING IGNITER FOR INTERNAL-COMBUSTION ENGINES.** ALFRED R. BELLAMY, Edgeley, Stockport, England. Filed Sept. 27, 1904. Serial No. 226,192.



Claim.—In combination a magneto-electric generator, a trip-lever mounted on the axis of the armature of the generator, a plunger connected to one end of such trip-lever, sparking mechanism connected to the other end of the plunger and means for oscillating the trip-lever in one direction consisting of a tappet carried by an eccentric-rod vibrated by an eccentric mounted on the side shaft of the engine the eccentric-rod being connected to a link pivoted onto a bracket or fixed part of the frame of the engine and means for adjusting such link toward or from the eccentric-rod substantially as described.

811,123. **CAR-STARTER.** ROBERT E. BOOTH and JOHN WEBB, Charleroi, Pa. Filed Aug. 10, 1905. Serial No. 273,519.

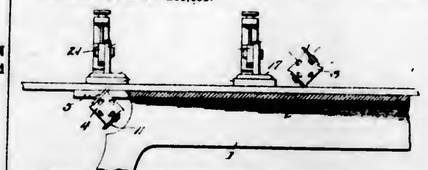


Claim.—1. In a car-starter, the combination of a pair of clamping-jaws having a lever mounted thereon, and provided with faces and inclined rear surfaces seated in the body-frame, substantially as described.

2. In a car-starter, the combination of a pair of clamping-jaws, having a lever mounted thereon and seated on inclined faces of the flanges of the body-frame, and the body-frame, substantially as described.

3. In a car-starter the combination of a lever, the said lever being mounted directly on a pair of clamping-jaws, a pair of clamping-jaws, the said jaws being provided with faces, and inclined rear surfaces adapted to be brought in engagement with the faces of the guiding-flanges of the body-frame, and the body-frame, the said body-frame being provided with inclined faces on the inner sides of the flanges substantially as described.

811,124. **MOLDING-BIT.** JOHN BOYD, Bessemer, Ala. Filed Mar 15, 1905. Serial No. 250,188.



Claim.—In a double-surfacing molding-machine, the combination of a horizontal feed-table, of upper and lower cutter-heads arranged respectively above and below the plane of the table and in different vertical planes, said cutter-heads being spread a distance apart, molding-bits adjustably fitted to the upper head and provided with a succession of straight V-shaped teeth, molding-bits adjustably fitted to the lower head and provided with a succession of continuous curved V-shaped teeth, a vertically and horizontally adjustable holder arranged over the feed-table directly above the lower cutter, a similarly-adjustable holder also arranged over the feed-table on one side of the vertical plane of the upper cutter, both of said holders having flat brace-holding heads, and a wooden bracing-guide rigidly secured to each holding-head, each wooden bracing-guide consisting of a wooden section of board dressed by the upper rotary cutter alone.

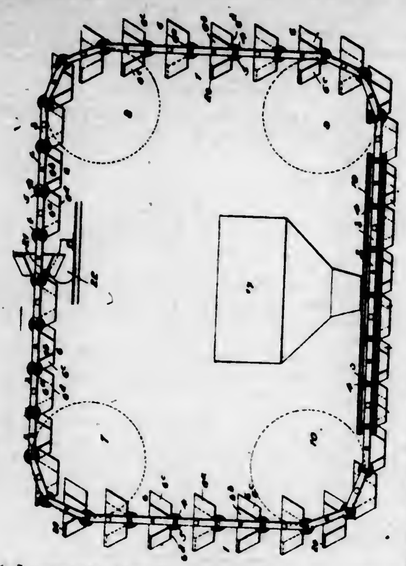
811,125. **CONVEYER.** BERTRAM H. BUCKER, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Mar. 16, 1904. Serial No. 198,453.

Claim.—1. In a conveyer, the combination with an endless carrier of a series of gravity-buckets trapezoidal in horizontal cross-section, each bucket having its sides arranged parallel to the adjacent sides of its adjoining buckets, substantially as set forth.

2. In a conveyer, the combination with an endless carrier, of a series of gravity-buckets trapezoidal in horizontal cross-section, each bucket having its sides arranged parallel to the adjacent sides of its adjoining buckets and normally separated therefrom, substantially as set forth.

3. In a conveyer, the combination with an endless carrier, of a series of gravity-buckets trapezoidal in horizontal cross-section, each bucket having its sides arranged parallel to the adjacent sides of its adjoining buckets and normally separated therefrom, and means

for causing the said adjacent sides of adjoining buckets to approach each other so as to close the passage-ways between them, substantially as set forth.



4. In a conveyer, the combination of a series of gravity-buckets, each bucket having a relatively narrow and a relatively wide end, the wider end of each bucket being arranged adjacent to the narrower ends of its adjoining buckets and normally out of alinement with said ends and the adjacent sides of adjoining buckets being parallel to each other and normally spaced apart, and means for moving the buckets longitudinally relative to each other to cause the buckets to approach each other and close the space between them, substantially as set forth.

5. In a conveyer, the combination of a series of longitudinally-tapering buckets, the wider end of each bucket being arranged adjacent to the narrower end of its adjoining buckets and the buckets being normally spaced apart, substantially as set forth.

6. In a conveyer, the combination of a series of longitudinally-tapering buckets, alternate buckets being oppositely arranged so that the wider end of each bucket is adjacent to the narrower ends of its adjoining buckets, the buckets being normally spaced apart, and means for causing the buckets to approach each other so as to close the passage-ways between them to prevent the spilling of material during the loading of the buckets, substantially as set forth.

7. In a conveyer, the combination of a series of longitudinally-tapering buckets, alternate buckets being oppositely arranged so that the wider end of each bucket is adjacent to the narrower ends of its adjoining buckets, the sides of the said buckets being parallel to each other and the adjacent ends of the adjoining buckets being normally out of alinement with each other so as to space the buckets apart, and means for causing the buckets to approach each other to close the passage-ways between them, substantially as set forth.

8. In a conveyer, the combination of a series of longitudinally-tapering buckets, alternate buckets being oppositely arranged so that the wider end of each bucket is adjacent to the narrower ends of its adjoining buckets, the adjacent sides of the adjoining buckets being parallel to each other and the adjacent ends of adjoining buckets being held normally out of alinement with each other so that the buckets will be spaced apart, and means for moving the buckets longitudinally relative to each other to close the passage-ways between them when they are being loaded, substantially as set forth.

9. In a conveyer, the combination of a series of longitudinally-tapering buckets, each bucket being arranged with its wider end adjacent to the narrower ends of its adjoining bucket, the pair of chains or carriers supporting the buckets at their opposite ends, and holding said buckets so that there is normally a space between them, and means for moving the chains laterally relative to each other so as to cause the buckets to approach each other and close the space between them, substantially as set forth.

10. In a conveyer, the combination with a pair of transporting chains or carriers, of a series of buckets mounted between said chains or carriers, each bucket being trapezoidal in horizontal cross-section and arranged with its wider end adjacent to the narrower ends of its adjoining buckets, the adjacent ends of the adjoining buckets being out of alinement with each other and the adjacent sides of the adjoining buckets being parallel with each other and normally spaced apart, and means for moving the said chains or carriers laterally relative to each other so as to move the buckets longitudinally of each other and close the passage-ways between them, substantially as set forth.

11. In a conveyer, the combination with a pair of transporting chains, of a series of buckets mounted between said chains and normally spaced apart, each bucket being trapezoidal in horizontal cross-section, the buckets being alternately fixed against longitudinal movement and free to move longitudinally apart, and means for moving the movable buckets longitudinally of the fixed ones to close the spaces between them, substantially as set forth.

12. In a conveyer, the combination with the endless carrier, of a series of gravity-buckets supported thereby the adjacent sides of adjoining buckets being normally spaced apart and means for causing the buckets to move longitudinally relative to their adjoining buckets to close the passage-ways between their adjacent sides to prevent spilling of material between the buckets during the loading thereof, substantially as set forth.

13. In a conveyer, the combination with a bucket-transporting device, of a series of buckets supported thereby, the adjacent sides of adjoining buckets being normally spaced apart, and means for causing each bucket at predetermined intervals to move longitudinally relatively to its adjoining buckets to close the passage-ways between the said buckets.

14. In a conveyer, the combination with a bucket-transporting device of a series of buckets supported thereby, the adjacent sides of adjoining buckets being normally spaced apart, means for actuating said bucket-transporting device, and means for closing the spaces between the buckets by causing the buckets to move longitudinally relatively to each other.

811,126. **CLASP FOR HATBANDS.** ELI A. BURT and HERBERT HARPER, New York, N. Y. Filed July 15, 1905. Serial No. 269,867.

Claim.—1. A clamp member for a hatband, comprising a metal plate folded upon itself, the two folds of the plate bent to form a hook and one end portion of the plate bent to overlap the folded portion thereof.

2. A clamp member comprising a metal plate folded upon itself, the two folds of the plate bent to form a hook and one end of the plate bent to overlap the folded portion thereof and a band passing around the folded hook portion and secured to the plate.

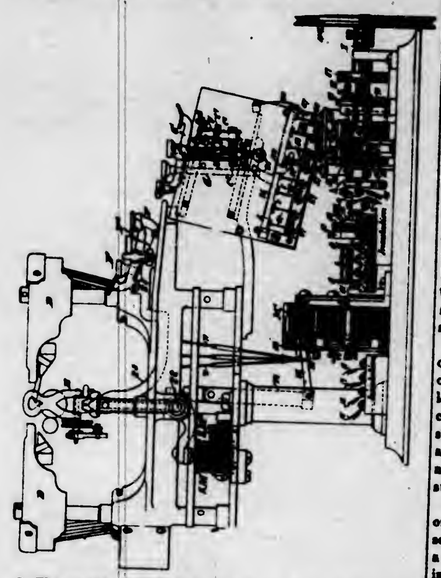
3. The combination of a band, a clamp member comprising a metal plate folded upon itself and clamping one end of the band between the folds, said folded portion bent to form a hook, and one end of the plate bent to overlap the folded portion thereof and clamp the band against the same.

4. The combination of a band, a clamp member comprising a plate folded upon itself and clamping one end of the band between the folds, the said folded portion bent to form a hook, the band passing around said hook and over and beyond the folded portion, and the end of the plate bent to overlap the folded portion and clamp the band thereagainst, said overlapping end of the plate having its free edge in proximity to the hook of the folded portion.

811,127. **TELEGRAPHY AND TELEGRAPH APPARATUS.** JOHN BURRY, New York, N. Y., assignor of one-half to James R. Munson, New York, N. Y. Filed Oct. 7, 1903. Serial No. 177,689.

Claim.—1. The combination of a series of members from which one is to be selected, a series of selectors determining the member to be selected, a magnet controlling said selectors according to the impulses received, and means for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

2. The combination of a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different strength, each magnet controlling a series of said selectors according to the impulses received, and means for sending impulses to said magnets varying in strength and combination with periods of rest according to the member to be selected, substantially as described.



3. The combination of a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different polarities, each magnet controlling a series of said selectors according to the impulses received, and means for sending impulses to said magnets varying in polarity and combination with periods of rest according to the member to be selected, substantially as described.

4. The combination of a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets, each magnet controlling a series of said selectors according to the impulses received, and means for sending impulses to said magnets in combination with periods of rest according to the member to be selected, substantially as described.

5. The combination of a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different polarities and different strengths, each magnet controlling a series of selectors according to the impulses received, and means for sending impulses to said magnets varying in polarity, strength and combination with periods of rest according to the member to be selected, substantially as described.

6. A telegraph-receiver having a series of members from which one is to be selected, a series of selectors determining the member to be selected and a magnet controlling said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

7. A telegraph-receiver having a series of members from which one is to be selected, a series of selectors the position of which determines the member to be selected, and a magnet controlling the position of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

8. A telegraph-receiver having a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different polarities, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in polarity and combination with periods of rest according to the member to be selected, substantially as described.

9. A telegraph-receiver having a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different strengths, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in strength and combination with periods of rest according to the member to be selected, substantially as described.

10. A telegraph-receiver having a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets responding to impulses of different polarities and different strengths each magnet controlling a series of said selectors according the impulses received, in combination with a transmitter for sending impulses to said magnets varying in polarity, strength and combination with periods of rest according to the member to be selected, substantially as described.

11. A telegraph-receiver having a series of members from which one is to be selected, a plurality of selectors determining the member to be selected, magnets, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in combination with periods of rest according to the member to be selected, substantially as described.

12. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors the position of which determines the member to be selected, and a magnet controlling the position of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

13. A telegraph-receiver having a series of members from which one is to be selected, a rotating selector-wheel carrying a plurality of selectors the position of which determines the member to be selected, a magnet controlling the position of said selectors according to the impulses received and acting on said selectors successively during the rotation of the selector-wheel, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

14. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors, the position of which determines the member to be selected, a plurality of magnets, each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets varying in combination with periods of rest according to the member to be selected, substantially as described.

15. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors, the position of which determines the member to be selected, a plurality of magntes responding respectively to impulses of different polarities and streagths and each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets varying in polarity, strength and combination with periods of rest according to the member to be selected, substantially as described.

16. A telegraph-receiver having a series of members one of which is to be selected and actuated, a selector-carrier having a plurality of selectors, devices coacting with said selectors to select the members to be actuated, a magnet controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, and mechanism for actuating the selected member after the selectors have returned to normal position, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be actuated and controlling the operation of the actuating mechanism, substantially as described.

17. A telegraph-receiver having a series of members one of which is to be selected and actuated, a selector-carrier having a plurality of selectors, devices coacting with said selectors to select the

member to be actuated, a magnet controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be actuated, and mechanism for actuating the selected member operating during the selection of the next member to be actuated, substantially as described.

18. A telegraph-receiver having a series of members from which one is to be selected, a selector-wheel carrying a plurality of selectors the position of which determines the character to be printed, a magnet controlling a series of said selectors according to the impulses received, in combinatiod with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnet varying in combination with periods of rest, substantially as described.

19. A telegraph-receiver having a series of members from which one is to be selected, a selector-wheel carrying a plurality of selectors the position of which determines the character to be printed, and magnets responding to currents of different polarities, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnet varying in combination with periods of rest, substantially as described.

20. A telegraph-receiver having a series of members from which one is to be selected, a selector-wheel carrying a plurality of selectors the position of which determines the character to be printed, and a magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter having two sunflowers rotating in synchronism with said selector-wheel for sending impulses from a single battery to said magnet varying in combination with periods of rest, substantially as described.

21. A printing-telegraph receiver having a selector-wheel carrying a plurality of selectors, devices coacting with said selectors to select the character to be printed, a magnet controlling a series of said selectors, and impression mechanism, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending to said magnet impulses varying in combination with periods of rest and controlling the impression mechanism, substantially as described.

22. A printing-telegraph receiver having a selector-wheel carrying a plurality of selectors, devices coacting with said selectors to select the character to be printed, magnets responding to currents of different polarities and each controlling a series of said selectors according to the impulses received, and impression mechanism, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnets varying in polarity and in combination with periods of rest, substantially as described.

23. A printing-telegraph receiver having a selector-wheel carrying a plurality of selectors, devices coacting with said selectors to select the character to be printed, magnets responding to currents of different polarities and each controlling a series of said selectors according to the impulses received, and impression mechanism, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnet varying in polarity and in combination with periods of rest, and impression mechanism operating to print the character selected during the selection of the next character to be printed, substantially as described.

24. A printing-telegraph receiver having a selector-wheel carrying a plurality of selectors, devices coacting with said selectors to select the character to be printed, magnets responding to currents of different polarities and strengths and each controlling a series of said selectors according to the impulses received, and impression mechanism, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnets varying in polarity, strength and in combination with periods of rest, substantially as described.

25. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a series of selectors controlling the position of said selector-bars, and a magnet controlling said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

26. A telegraph-receiver having a series of members, from which one is to be selected, a series of sliding selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a series of selectors controlling the position of said selector-bars, and a magnet controlling said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

27. A telegraph-receiver having a series of members, from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a series of selectors controlling the position of said selector-bars, magnets responding to impulses of different polarities, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in polarity and combination with periods of rest according to the member to be selected, substantially as described.

28. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a series of selectors controlling the position of said selector-bars, magnets responding to impulses of different strengths, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in strength and combination with periods of rest according to the member to be selected, substantially as described.

29. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a series of selectors controlling the position of said selector-bars, magnets responding to impulses of different polarities and strengths, each magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in polarity and strength and combination with periods of rest according to the member to be selected, substantially as described.

30. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a movable selector-carrier having a plurality of selectors determining the position of said selector-bars, and a magnet controlling the position of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

31. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a rotating selector-wheel having a plurality of selectors determining the position of said selector-bars, and a magnet controlling the position of said selectors according to the impulses received and acting on said selectors successively during the rotation of the selector-wheel, in combination with a transmitter for sending impulses to said magnet varying in combination with periods of rest according to the member to be selected, substantially as described.

32. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a movable selector-carrier having a plurality of selectors determining the position of said selector-bars, and a plurality of magnets each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets varying in combination with periods of rest according to the member to be selected, substantially as described.

33. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a movable selector-carrier having a plurality of selectors determining the position of said selector-bars, and a plurality of magnets responding respectively to impulses of different polarities and strength and each controlling the position of a series of said selectors according to the impulses received, and acting on the selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets varying in polarity, strength, and combination with periods of rest, according to the member to be selected, substantially as described.

34. A printing-telegraph receiver having a series of selector-bars provided with portions of different elevation and devices by which the position of said bars determines the character to be printed, impression mechanism, a selector-wheel carrying a plurality of selectors controlling said selector-bars, and a plurality of magnets each controlling a series of said selectors, according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in combination with periods of rest and controlling the impression mechanism, substantially as described.

35. A printing-telegraph receiver having a series of selector-bars provided with portions of different elevation and devices by which the position of said bars determines the character to be printed, impression mechanism, a selector-wheel carrying a plurality of selectors controlling said selector-bars, and a plurality of magnets each controlling a series of said selectors, according to the impulses received, in combination with a transmitter, having a sunflower rotating in synchronism with said selector-wheel for sending impulses to said magnets varying in combination with periods of rest and controlling the impression mechanism, substantially as described.

36. A printing-telegraph receiver having a series of selector-bars provided with portions of different elevation and devices by which the position of said bars determines the character to be printed, a selector-wheel carrying a plurality of selectors controlling said selector-bars, and a plurality of magnets each controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets varying in combination with periods of rest, and impression mechanism operating to print the character selected during the selection of the next character to be printed, substantially as described.

37. A movable selector-carrier having a series of selectors in combination with a controller movable into and out of position to act on said selectors, and a magnet controlling the position of said controller to act on different selectors during the movement of the carrier, according to the impulses received by said magnet, substantially as described.

38. A movable selector-carrier having a plurality of series of selectors, in combination with controllers movable into and out of position to act on said selectors, and magnets controlling the position of said controllers to act on different selectors during the movement of said carrier, according to the impulses received by said magnets, substantially as described.

39. A selector-wheel having a series of selectors arranged at the same distance from the center of the wheel, in combination with a controller movable into and out of position to act on said selectors, and a magnet controlling the position of said controller to act on different selectors during the rotation of said wheel, according to the impulses received by said magnet, substantially as described.

40. A selector-wheel having a plurality of series of selectors, the selectors of each series arranged at the same distance from the center of the wheel, in combination with a controller for each series movable into and out of position to act on said selectors, and magnets controlling said controllers to act on different selectors during the rotation of the wheel according to the impulses received by said magnets, substantially as described.

41. A selector-wheel having a plurality of series of selectors, the selectors of each series arranged at the same distance from the center of the wheel, in combination with a controller for each series movable into and out of position to act on said selectors, magnets controlling said controllers to act on different selectors during the rotation of the wheel according to the impulses received by said magnets, and devices engaging the said selectors during the movement of the wheel to return them to normal position, substantially as described.

42. The combination with a series of keys, of contact-pieces actuated by said keys in different combinations and completing the circuit through the successive segments of a sunflower to send impulses to line in different combinations with periods of rest, a printing-receiver having a magnet controlled by said impulses and selecting devices controlled by the impulses transmitted to said magnet, substantially as described.

43. The combination with a series of keys, of contact-pieces actuated by said keys in different combinations and completing the circuit through the successive segments of sunflowers to send impulses of different polarities and strengths to line, and a printing-receiver having magnets responding to impulses of different polarities and strengths controlled by said impulses, and selecting devices controlled by the impulses transmitted to said magnets, substantially as described.

44. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors, the position of which determines the member to be selected, and a magnet controlling the position of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnet according to the member to be selected, substantially as described.

45. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors, the position of which determines the member to be selected, a plurality of magnets, each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets according to the member to be selected, substantially as described.

46. A telegraph-receiver having a series of members from which one is to be selected, a movable selector-carrier having a plurality of selectors, the position of which determine the members to be selected, a plurality of magnets responding respectively to impulses of different polarities and strengths and each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets varying in polarity and strength according to the member to be selected, substantially as described.

47. A telegraph-receiver having a series of members one of which is to be selected and actuated, a selector-carrier having a plurality of selectors, devices coacting with said selectors to select the members to be actuated, a magnet controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, and mechanism for actuating the selected member after the selectors have returned to normal position, in combination with a transmitter for sending impulses to said magnet according to the member to be actuated and controlling the operation of the actuating mechanism, substantially as described.

48. A printing-telegraph receiver having a selector-wheel carrying a plurality of selectors, devices coacting with said selectors to select the character to be printed, a magnet controlling a series of said selectors, and impression mechanism, in combination with a transmitter having a sunflower rotating in synchronism with said selector-wheel for sending to said magnet impulses according to the character to be printed and controlling the impression mechanism, substantially as described.

49. A telegraph-receiver having a series of members from which one is to be selected, a series of selector-bars having portions varying in elevation and selecting the member according to the position of said portions, a movable selector-carrier having a plurality of selectors determining the position of said selector-bars, and a plurality of magnets each controlling the position of a series of said selectors according to the impulses received and acting on said selectors successively as they are moved by the selector-carrier, in combination with a transmitter for sending impulses to said magnets according to the member to be selected, substantially as described.

50. A printing-telegraph receiver having a series of selector-bars provided with portions of different elevations and devices by which the position of said bars determines the character to be printed, impression mechanism, a selector-wheel carrying a plurality of selectors controlling said selector-bars, and a plurality of magnets each controlling a series of said selectors according to the impulses received, in combination with a transmitter for sending impulses to said magnets according to the character to be printed and controlling the impression mechanism, substantially as described.

51. A telegraph-receiver having a series of members from which one is to be selected, a selector-carrier carrying a plurality of selectors the position of which determines the member to be selected, and a magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter having a sunflower moving in synchronism with said selector-carrier for sending to said magnet combinations of impulses, each successive impulse of each combination being of greater duration than the preceding one, substantially as described.

52. The combination with a selector-carrier, and one or more magnets controlling the selectors, of a sunflower moving in synchronism with said selector-carrier for sending impulses to said magnet or magnets and having transmitting-segments of successively-increasing length, substantially as described.

53. The combination with a telegraph-transmitter having a sunflower with transmitting-segments of successively-increasing length, of a telegraph-receiver having a member moving in synchronism with said sunflower, and one or more magnets coacting with said

member and receiving impulses through said sunflower, substantially as described.

54. A telegraph-receiver having a series of members from which one is to be selected, a selector-carrier carrying a plurality of selectors the position of which determines the character to be printed, and a magnet controlling a series of said selectors according to the impulses received, in combination with a transmitter having two sunflowers moving in synchronism with said selector-carrier for sending impulses from a single battery to said magnet varying in polarity, substantially as described.

55. The combination with a telegraph-receiver and a keyboard transmitter, of a switch normally closing a short circuit around the transmitter and actuated on the actuation of any one of the keys to break the short circuit and establish a circuit between the receiver and the transmitter, and a cut-out breaking the circuit between the receiver and transmitter after the completion of the operation produced by the key, substantially as described.

56. The combination with a telegraph-receiver and a keyboard-transmitter, of a switch A and main-line contact c^{14} and shunt-contact c^{6} with both of which the switch normally makes contact, means for moving the switch to break contact c^{6} on the actuation of a key, and a trip engaging the switch to break contact c^{14} after the completion of the operation produced by the key if the key has not been released and from which trip the switch is disengaged on the release of the key, substantially as described.

57. In a keyboard telegraph-transmitter, the combination with a rotary member connected to the driver by a friction-clutch, and a stop normally holding said member stationary, of a magnet controlling said stop, and a switch shifted at each depression of a key to energize said magnet and withdraw said stop, substantially as described.

58. In a keyboard telegraph-transmitter, the combination with a rotary member connected to the driver by a friction-clutch, and a stop normally holding said member stationary against the driver, of a magnet controlling said stop, a switch shifted at each depression of a key to energize said magnet to withdraw the stop, and means for throwing said magnet out of circuit during the rotation of the rotary member, substantially as described.

59. The combination of a telegraph-receiver and a telegraph-transmitter having members rotating in unison, magnets controlling the connection of said members with their drivers and energized to secure the movement of the shafts when the transmitter is actuated, means for throwing said magnets out of circuit when the rotary members are moved out of normal position, and means for disconnecting the members from their drivers at a certain point after each actuation of the transmitter, substantially as described.

60. A telegraph-receiver having a rotating member, a clutch for connecting said member to the driver, a switch for disconnecting said member from the driver at the end of each rotation, and a magnet controlling the connection and energized to connect the rotating member to its driver for the next rotation, substantially as described.

61. A telegraph-receiver having a rotating member, a clutch for connecting said member to the driver, means for disconnecting said member from the driver at the end of each rotation, a magnet controlling the connection and energized to connect the rotary member to the driver for each rotation, and means for throwing said magnet out of circuit when the rotary member is moved out of normal position, substantially as described.

62. The combination with a printing-telegraph receiver actuated by combinations of electric impulses and having a case-shift actuated by impulses of certain strength, of a transmitter having a series of keys, and a shifting member by which the strength of an impulse of the combinations as sent by the normal operation of the transmitter is varied to actuate the case-shift, substantially as described.

63. The combination with a printing-telegraph receiver actuated by combinations of electric impulses and having a case-shift actuated by impulses of a certain polarity, of a transmitter having a series of keys, and a shifting member by which the polarity of an impulse of the combinations as sent by the normal operation of the transmitter is varied to actuate the case-shift, substantially as described.

64. The combination with a printing-telegraph receiver actuated by combinations of electric impulses of different polarities and strength and having a double case-shift actuated by an impulse of a certain strength and either polarity, of a transmitter having a series of keys and a shifting member by which the strength or the strength and polarity of an impulse of the combinations as sent by the normal operation of the transmitter may be varied to actuate the case-shift for either case, substantially as described.

65. The combination with a printing-telegraph receiver actuated by combinations of electric impulses and having a case-shift actuated by first impulses of a certain strength, of a transmitter having a series of keys and a shifting member by which the strength of the first impulses of a combination is varied to actuate the case-shift, substantially as described.

66. The combination with a printing-telegraph receiver actuated by combinations of electric impulses and having a case-shift actuated by first impulses of a certain polarity, of a transmitter having a series of keys, and a shifting member by which the polarity of the first impulse of a combination is varied to actuate the case-shift, substantially as described.

67. The combination with a printing-telegraph receiver actuated by combinations of electric impulses of different polarities and strengths and having a double case-shift actuated by first impulses of a certain strength and either polarity, of a transmitter having a series of keys and a shifting member by which the strength or the strength and polarity of the first impulse of a combination as sent by the normal operation of the transmitter may be varied to actuate the case-shift for either case, substantially as described.

68. The combination with a local circuit, of a line-magnet having an armature forming a contact in the local circuit, and a moving cut-out closing the circuit after the armature-contact is closed, substantially as described.

69. The combination with a telegraph-receiver having a rotating member and actuated by a series of electric impulses in a local circuit during the rotation of said member, of a line-magnet having an armature forming a contact in the local circuit, and a rotating cut-out closing the circuit in the normal position of the rotating member, and closing the circuit for the second and subsequent impulses during a rotation of the rotating member after the armature-contact is closed, substantially as described.

70. The combination with a telegraph-receiver having a rotating member and actuated by a series of electric impulses during the rotation of said member, of a transmitter having a member rotating in synchronism with the rotating member of the transmitter, and a rotating cut-out making a short close of the receiver-circuit, substantially as described.

71. The combination with a telegraph-transmitter having a sunflower, of a receiver actuated by electric impulses transmitted through the successive sections of the sunflower and having a member rotating in synchronism therewith and a cut-out making a short close of the receiver-circuit, substantially as described.

72. The combination with a telegraph-transmitter having a sunflower, of a receiver having a selector-wheel rotating in synchronism therewith, a series of selectors carried by said wheel and corresponding with the sunflower-sections, a controller acting on said selectors as they are carried past the controller by the selector-wheel, a magnet controlling said controller, and a cut-out rotating with the selector-wheel and making a short close of the magnet-circuit as the selectors to be acted on reach the controller, substantially as described.

73. The combination with a telegraph-receiver having a carriage, a rotating member, a member normally free to rotate independently of the rotating member and connected to the carriage by a cord or similar device, and a clutch, of a transmitter, and means controlled from said transmitter for actuating said clutch to connect said member for the return of the carriage, substantially as described.

74. The combination with a telegraph-receiver having a carriage, a rotating member, a member normally free to rotate independently of the rotating member and connected to the carriage by a cord or similar device, and a clutch, of a transmitter, and means controlled from said transmitter for actuating said clutch to connect said member for the return of the carriage, and means for releasing the clutch by the return of the carriage, substantially as described.

75. The combination with a carriage, a rotating member, a member normally free to rotate independently of the rotating member and connected to the carriage by a cord or similar device, and a clutch, of a sliding member actuating said clutch to connect said members for the return of the carriage, and a trip on said cord by which the sliding member is shifted for the release of the clutch when the carriage has been returned, substantially as described.

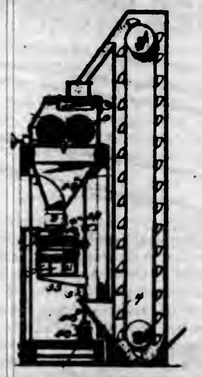
76. The combination with a selector-wheel having a plurality of series of selectors, as s', s^2, &c., mounted to move longitudinally of the selector-wheel, the selectors of each series arranged at the same distance from the center of the wheel, of a controller, as m', m^2, &c., for each series, and magnets controlling said controllers, substantially as described.

77. The combination with a selector-wheel having a plurality of series of selectors, as s', s^2, &c., mounted to move longitudinally of the selector-wheel, the selectors of each series arranged at the same distance from the center of the wheel, of a controller, as m', m^2, &c., for each series having a cam-face to engage the selectors, and magnets controlling said controllers, substantially as described.

78. The combination with a series of sliding selector-bars, and a selector-wheel having a series of selectors controlling the position of said selector-bars, of a return-bar 72 for said selector-bars actuated by the selector-wheel, substantially as described.

79. A telegraph-receiver having a rotating member, a clutch for connecting said member to the driver, a detent for said member, a magnet controlling said detent to release said member, and means for throwing said magnet out of circuit when the member is moved out of normal position and before the completion of its movement, substantially as described.

811,128. GRADUAL-REDUCTION MILL. JOHN M. CAMP, Cincinnati, Ohio. Filed Mar. 21, 1903. Serial No. 148,944.



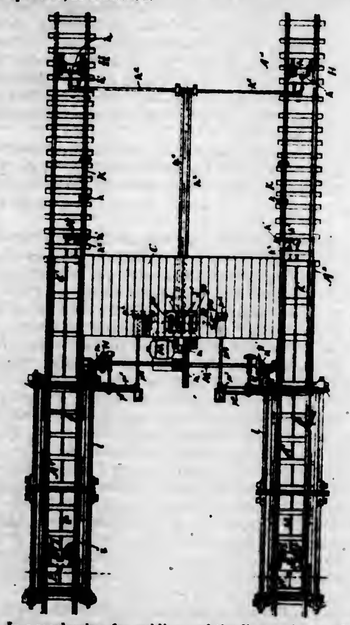
Claim.—1. In a gradual-reduction milling-machine, arranged in a single structure, the combination of a series of mills arranged in a horizontal line, a gyratory bolt structure disposed beneath the mills and comprising a series of independent bolts having a plurality of sieves, separate connections between each mill and a bolt, a plurality of troughs receiving the material from each bolt, and means for conveying a plurality of the products of the same bolt received by the troughs, from the troughs to separate mills of the series.

2. In a gradual-reduction milling-machine, arranged in a single structure, the combination of a series of mills arranged in a horizontal line, a gyratory bolt structure disposed beneath the mills and comprising a series of independent bolts having a plurality of sieves, separate connections between each mill and a bolt, a conveyor movable with the structure and embodying a plurality of troughs disposed to receive all the products from each bolt, and the products from the same bolt in different troughs, and means for conveying a plurality of the products of the same bolt received by the troughs, from the troughs to separate mills of the series.

811,129. CAR-DUMP. CLARENCE R. CLAESSEN, Wabash, Pa. Filed May 28, 1903. Serial No. 159,261.

Claim.—1. In a mechanism for guiding and tippling coal-cars, the combination of a main railway-track extending from the region of mining and loading the coal to points near the tipple, two branch tracks each adapted to communicate with the main track to receive therefrom and retain a train or "trip" of loaded cars, two tippling mechanisms each on the line of one of the said branch tracks, a stop mechanism on each track that leads to a tipple for stopping the train or "trip" of cars, a car-stop on each tipple to prevent longitudinal advance of the cars, a power mechanism for rotating each of the tipples, a manually-actuated mechanism for controlling each of the said car-stops on the track that leads to the tipple, and a manually-actuated mechanism for controlling the tipple-rotating power devices, both sets of manually-actuated mechanisms being located substantially as described, whereby they are instantly accessible to a single operator while in one position, as set forth.

2. In a mechanism for guiding and tippling coal-cars, the combination of a main track extending from the region of mining and loading the coal to points near the tipple, two branch tracks adapted to communicate with the main track, two laterally-rotary tipplers, one on the line of each branch car-track, a car-stop on each branch track adapted to be manually opened and to be automatically reset, a car-stop on each tipple adapted to be automatically opened by advancing cars and to be automatically reset, a lock for each tipple to prevent its rotating, power devices for rotating each tipple, and two sets of manually-actuated devices for releasing the car-stops on the branch tracks, for releasing the tipple-locks and for connecting the power devices to the tipples, each set of manually-actuated devices being arranged substantially as set forth, whereby they are accessible to a single operator, as described.



3. In a mechanism for guiding and tippling coal-cars, the combination of a main track extending from the region of mining and loading coal to points near the tippling mechanism, two branch tracks adapted to communicate with the main track, two laterally-rotating tipples, one in the line of each branch track, a car-stop on each branch track for arresting the train or "trip" of cars thereon, and adapted to be automatically reset after being opened, means on each tipple for stopping the longitudinal motion of the cars thereon, power devices for rotating each tipple, two sets of manually-actuated devices for controlling the car-stops on the stationary tracks and the tipple-rotating mechanism, both of said sets being situated relatively close together for the purposes described, a fixed hopper or receptacle below each tipple for receiving the coal therefrom, and a supplemental pit or chamber into which the coal can be passed at will from each of the said hoppers, substantially as set forth.

4. In a mechanism for guiding and tippling coal-cars, the combination of a main track extending from the region of mining and loading the coal to points near the tippling mechanism, two branch tracks adapted to communicate with the main track, two laterally-rotating tipplers, one in the line of each branch track, a car-stop on the stationary part of each branch track, a car-stop on and rotating with each rotary tippler, power mechanism for rotating the tipplers, two sets of manually-actuated devices for controlling the stationary car-stops, and the mechanism for rotating the tipplers arranged substantially as set forth, whereby they are accessible to a single operator, and means actuated by advancing cars for releasing the rotary car-stops on the tipplers, substantially as set forth.

5. In a mechanism for tippling cars, the combination of the initial track-section, the track-section which finally receives the cars after emptying, the laterally-rotary tippler mechanism between the said two car-sections, the stop for arresting the cars from longitudinal motion while on the tippler, the stop on the initial track-section adjacent to the tippler for arresting the cars from longitudinal motion, means for operating said last-described stop, and means actuated by the cars on the initial stationary section for releasing said stop on the tippler, substantially as set forth.

6. In a mechanism for tippling coal-cars, the combination with

the laterally-rotary tippler, and the initial track-section for delivering loaded cars thereto, of the car-stop on the laterally-rotary tippler, the lock for said stop, and the tripping mechanism adjacent to the initial stationary track and adapted to be actuated by the cars for releasing the stop on the tippler to permit the passage therefrom of the cars, substantially as described.

7. In a mechanism for tippling cars, the combination of the laterally-rotating tippler, the initial stationary track-section delivering cars thereto, the stop for arresting the cars arranged on said track-section adjacent to the said tippler, means for operating said stop, the stop for arresting the cars while on the tippler, and the two-part mechanism for releasing the stop, one of the parts thereof being mounted on the tippler, and the other being mounted independently of the tippler, and means actuated by the advancing cars for imparting movement to the last said part of the stop-releasing mechanism, substantially as described.

8. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, of the lock-bar for holding the tippler in normal position, and adapted to yield to permit the tippler to move beyond and then return to its normal position, substantially as set forth.

9. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, of the lock-bar adapted to engage with the tippler, and to swing toward and from its axis, and to yield relatively to the rotary movement of the tippler, substantially as set forth.

10. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, and the longitudinally and laterally movable lock-bar to hold the tippler in normal position, of means for actuating the bar to release the tippler, and a tripping mechanism adapted to be actuated by the tippler for moving the lock-bar toward the tippler and into its active position, substantially as set forth.

11. In a mechanism for tippling cars, the combination of the laterally-rotating tippler, the power devices for imparting power to the tippler, the clutch for engaging and disengaging the power devices, the lock for positively holding the tippler against rotation, the lever or actuating device for opening the lock and engaging the clutch members, the said parts being arranged substantially as set forth, to have the lock first opened and the clutch subsequently engaged during one continuous movement in one direction of the actuating-lever, and means actuated by the said rotating tippler for simultaneously releasing said clutch and throwing said lock-bar into operative position substantially as set forth.

12. In a mechanism for guiding and tippling coal-cars, the combination of a main railway-track, a plurality of branch tracks each adapted to communicate with the main track, a plurality of tippling mechanisms each on a line of one of said branch tracks, a car-stop on each tipple to prevent the longitudinal advance of the cars thereon, a power mechanism for rotating each of the tipplers, and manually-actuated mechanisms for controlling the tipple-rotating power devices arranged to be instantly accessible to a single operator while in one position.

13. In a mechanism for guiding and tippling coal-cars, the combination of a main railway-track, a plurality of branch tracks each adapted to communicate with the main track, a plurality of tippling mechanisms each on a line of one of said branch tracks, a car-stop on each tipple to prevent the longitudinal advance of the cars thereon, a power mechanism for rotating each of the tipplers automatic means for actuating said car-stops on the tipples, and manually-actuated mechanisms for controlling the tipple-rotating power devices arranged to be instantly accessible to a single operator while in one position.

14. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, of spring-controlled means for holding the tippler yieldingly in car-receiving position.

15. In a mechanism for tippling cars, the combination with the laterally-rotating tippler, of means for limiting the rotation of the tippler to one complete revolution, said means including a spring-controlled lock-bar for holding said tippler yieldingly in car-receiving position.

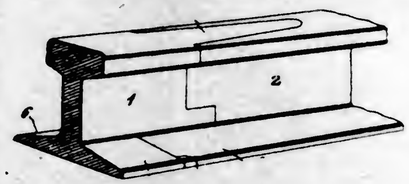
16. In a mechanism for tippling cars, the combination with the laterally-rotating tippler, of the lock-bar for holding the tippler in car-receiving position and the spring for holding the lock-bar yieldingly in normal position.

17. In a mechanism for tippling cars, the combination with the laterally-rotating tippler, of the lock-bar for holding the tippler in normal position, the spring for holding the lock-bar in normal position and for permitting it to yield longitudinally, and means for disengaging the lock-bar from the tippler.

18. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, of the lock-bar adapted to engage with the tippler, and to hold it yieldingly in car-receiving position the train of manually-operated devices for disengaging the lock-bar from the tippler, and the train of automatically-operated devices actuated by said tippler and adapted to return the lock-bar to its normal position.

19. In a mechanism for tippling cars, the combination with a laterally-rotating tippler, of the train of power devices for actuating said tippler having in said train a clutch, the lock-bar adapted to engage with the tippler and to hold it yieldingly in car-receiving position, the operating-handle, the draft-transmitting devices connecting said handle with said lock-bar and with the movable element of said clutch and adapted to release the lock-bar and to cause the engagement of the clutch element when it is moved in one direction, and means actuated by the tippler for returning the said lock-bar to its normal position and for disengaging the clutch element.

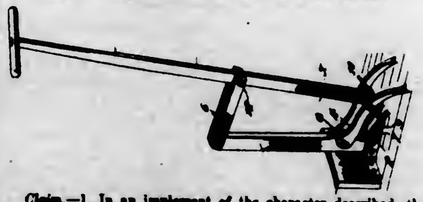
811,130. RAIL-JOINT. SAMUEL T. COVERSTONE, Mount Pleasant, Mich. Filed May 29, 1905. Serial No. 262,845.



Claim.—1. A joint for the ends of railway-rail sections, one of said ends having formed in the tread thereof a V-shaped tapering longitudinally-disposed groove or channel at the inner end of which is formed a recess, a tapering triangularly-shaped tongue formed on the end of the adjacent rail-section to engage said groove or channel, a reduced projection formed on the end of said tongue to enter said recess, and a vertical and lateral interlocking connection between the lower portions of said ends, substantially as described.

2. A joint for the ends of railway-rail sections, one of said ends having formed in the tread thereof a V-shaped tapering longitudinally-disposed groove or channel at the inner end of which is formed a recess, said end being provided below said groove or channel with a horizontally-disposed notch or recess, an extended base-flange formed on said end below said notch, said base-flange having formed therein a vertically-disposed notch or recess, a tapering triangularly-shaped tongue formed on the end of the adjacent section to engage said groove or channel, a reduced projection formed on said tongue to engage the recess in the end of said groove, a lug formed on the end of said rail below said tongue, the base-flange of said end below said lug being recessed or cut away whereby the end of said rail-section is adapted to be interlocked with the notched and recessed end of the adjacent rail-section, against vertical or lateral movement, substantially as described.

811,131. PRESSURE AND MOVING JACK. PETER DEMPSEY, Michigamme, Mich. Filed Oct. 18, 1905. Serial No. 283,306.



Claim.—1. In an implement of the character described, the combination of a pressure-head, a detent coöperating therewith, a power-augmenting lever having pivotal connection with said head, a feed-dog pivoted to said power-augmenting lever, and an operating-lever pivoted to said feed-dog and connected to the upper end of the power-augmenting lever.

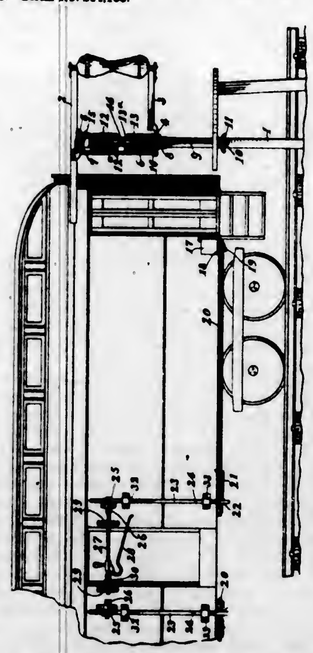
2. In an implement of the character described, the combination of a pressure-head, a detent extended from the rear side thereof and constituting a shoe or runner for sustaining the pressure-head in upright position, a power-augmenting lever having pivotal connection with the pressure-head, a feed-dog coöperating with said power-augmenting lever, and an operating-lever pivoted to said feed-dog and connected with the power-augmenting lever.

3. In an implement of the character set forth, the combination of a pressure-head, a detent coöperating therewith, a power-augmenting lever having pivotal connection with said pressure-head, a feed-dog pivoted to said power-augmenting lever and comprising spaced members which are rearwardly diverged, an operating-lever pivoted between the members of said feed-dog, and means connecting said operating-lever with the power-augmenting lever.

4. In an implement of the character set forth, the combination of a pressure-head, a detent coöperating therewith, a power-augmenting lever having pivotal connection with said pressure-head, a feed-dog comprising companion members arranged upon opposite sides of the power-augmenting lever and rearwardly diverged, an operating-lever inserted between the members of said feed-dog, means pivotally connecting said operating-lever to the members of the feed-dog, and means connecting the operating-lever with the upper portion of the power-augmenting lever.

5. The herein-described jack for the purposes specified, the same consisting of a pressure-head made hollow upon its outer side, a detent extended from the rear side of said pressure-head and comprising spaced members, said detent forming a shoe or runner, a power-augmenting lever pivotally supported between the members of the detent, a feed-dog comprising companion members arranged upon opposite sides of the power-augmenting lever, an operating-lever pivotally supported between the members of said feed-dog, and a link connection between the operating-lever and the upper portion of the power-augmenting lever.

811,132. AUTOMATIC MAIL-BAG CATCHER FOR RAILWAYS. HARRY G. DIX and BERT C. W. DIX, Grand Rapids, Mich. Filed June 7, 1905. Serial No. 264,100.



Claim.—1. The combination of a mast, rings rotative about the mast, arms supported by the respective rings, a rod connecting the rings, oppositely-acting springs engaging the rod, a bolt to hold the rings from turning, and means for releasing the bolt when a car approaches the device.

2. The combination of a mast, rings rotative about the mast, arms supported by the rings, a rod connecting the rings, a stop on the mast, springs oppositely and yieldingly engaging the stop and rod, a bolt to hold the rings from turning, and means for releasing the bolt when a car approaches the device.

3. The combination of a mast, collars fixed on the mast, rings rotative on the collars, arms supported by the rings, a rod connecting the rings, a stop on the mast, springs surrounding the mast and oppositely engaging the stop and rod, a bolt in the lower collar and engaging the lower ring to hold the same, and a lever to withdraw the bolt and adapted to be operated by a passing car.

4. The combination of a mast, collars fixed on the mast and spaced apart, rings rotative on the collars, arms pivoted to the rings, rods connecting the rings, a stop on the mast, springs surrounding the mast and fixed at their outer ends, and also having their adjacent ends projecting outward to oppositely engage the stop and one of the rods, and means for holding and releasing the rings.

5. The combination of a mast, collars on the mast and spaced apart, rings rotative on the collars, arms pivoted to the rings, rods connecting the rings, a stop on the mast, a washer and a pin fixed on the mast, a spring surrounding the mast and engaging the pin at one end and also engaging the stop and one of the rods at the other end, a second spring surrounding the mast and attached to the washer at one end and also engaging the said stop and rod at the other end and oppositely to the other spring, and means for holding and releasing the rings.

6. The combination of a mast, arms to support a mail-bag and rotative about the axis of the mast, a bolt to hold and release the arms, a pivoted lever to operate the bolt, a transverse and oppositely-inclined member on the lever, a second pivoted lever engaging the said member at one end, and means mounted on a car for engaging the other end of the last-named lever to release the bolt.

7. The combination of a mast, rings rotative about the axis of the mast, arms supported by the rings, a rod connecting the rings oppositely-acting springs engaging the rod, a bolt engaging and holding the lower ring, a lever engaging the bolt and pivoted on the horizontal axis, a transverse member on the said lever and having downwardly-inclined ends, and a second lever engaging said member at one end and pivoted near the middle on a vertical axis.

8. In combination with a railway-car, a rotative and longitudinally-movable shaft, a bag-catcher fixed on the shaft, a clutch engaging the shaft and means for automatically rotating the clutch.

9. In combination with a railway-car having a door in its side, a longitudinally-movable and rotative shaft opposite the door, a bag-catcher fixed on the shaft, a clutch engaging the shaft, a spring to hold the clutch engaged with the shaft, a spring to rotate the clutch, and means attached to the car for holding and releasing the spring.

10. In combination with a railway-car having a door in its side, a shaft opposite the door, a bag-catcher on the shaft, a clutch engaging the shaft, a rack and pinion to operate the clutch, a spring to move the rack, a pawl to hold the spring under tension and to release the same, and a pivoted plate to release the pawl when the plate is engaged by an obstruction.

11. In combination with a railway-car having a door in its side, a shaft opposite the door, a clutch engaging the shaft, a pinion on the clutch, a rack-bar having teeth engaging the pinion, a rotative shaft extending from the rack-bar to near the end of the car, a pinion on the shaft and engaging teeth in the rack-bar, a spring to rotate the shaft, a collar on the shaft, a pawl engaging the collar, and a plate pivoted near one side on a vertical axis and engaging the pawl near its other side.

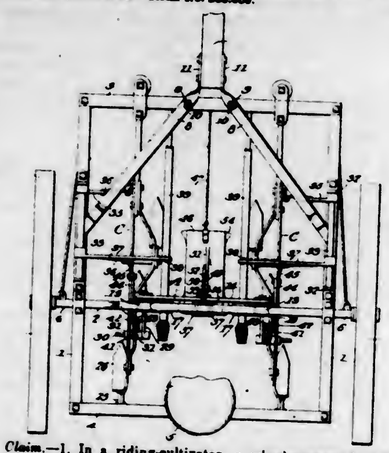
12. In combination with a railway-car having a door in its side, a longitudinally-movable and reversible shaft opposite the door, a bag-catcher fixed on the shaft, a clutch at each side of the door to alternately engage the end of the shaft, and separate means for operating the respective clutches and extended to near the respective ends of the car.

13. In a bag-catching device of the class described, in combination with a car having a door in its side, a shaft opposite the door, bearings for the shaft and open at the upper side, pivoted arms engaging the upper side of the shaft, a bag-catcher fixed on the shaft, a clutch opposite each end of the shaft to alternately engage on end of the same, and means for separately operating the clutches.

14. The combination of a mast, arms rotative about the axis of the mast, a spring to rotate the arms, a bolt to hold the arms, a lever to release the bolt, a bag-catcher mounted on a railway-car, a spring to turn the catcher to operative position, a pawl to hold the spring under tension, a pivoted plate on the car to engage the lever and release the pawl and bolt.

15. The combination of a mast, rings rotative on the mast, a rod connecting the rings, a stop on the mast, springs oppositely engaging the stop and rod, a bolt to hold the rings, a lever to operate the bolt, a railway-car having a door in its side next the mast, a shaft opposite the door, a bag-catcher on the shaft, a clutch engaging the shaft, a rack and pinion to rotate the clutch, a spring to move the rack, a pawl to hold the spring under tension, and a pivoted plate to engage the pawl and the lever and release the spring and bolt.

811,133. CULTIVATOR. JAMES M. DONALDSON, Marengo, Iowa. Filed Apr. 20, 1905. Serial No. 256,669.



Claim.—1. In a riding-cultivator, a wheel-supported arched axle, a frame supported upon said axle and having a front cross-bar, a traveling frame engaging said cross-bar and including clevis-blocks having wheels engaging the cross-bar, a connecting-bar upon which said clevis-blocks are adjustably mounted, and securing means for said blocks; the latter being provided with vertical apertures in which the front ends of the cultivator-gangs are movably supported.

2. In a riding-cultivator, an arched wheel-supported axle, a frame supported upon said axle and having a cross-bar, a traveling frame including a pair of adjustably-connected clevis-blocks having vertical apertures and provided with rollers engaging the cross-bar of the main frame, a traveling arch-frame supported upon the axle-arch and having depending vertical members, cultivator-gangs having upwardly and forwardly extended front ends movable in the vertical apertures of the clevis-blocks of the traveling frame, and loop members adjustably connected with the cultivator-gangs and slidably engaging the vertical members of the traveling arch-frame.

3. In a riding-cultivator, the combination with suitable supporting means, of a plurality of laterally-movable frames, cultivator-gangs engaging said frames for bodily vertical adjustment, and means for effecting lateral adjustment of the frames and cultivator-gangs.

4. In a riding-cultivator, the combination with suitable supporting means, of a plurality of laterally-movable frames, cultivator-gangs engaging said frames for bodily vertical adjustment, means supported upon one of said frames for effecting such vertical adjustment, and means for effecting lateral adjustment of the frames and cultivator-gangs.

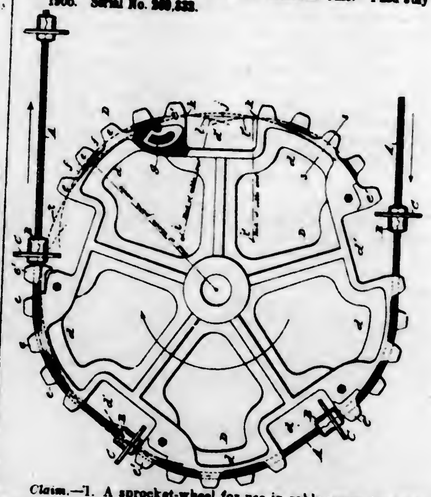
5. In a riding-cultivator, a main supporting-frame, rock-shafts supported for oscillation upon the side members of said frame, each of said rock-shafts being provided with a plurality of depending arms, a plurality of laterally-movable frames, cultivator-gangs engaging said frames for bodily vertical adjustment, links connecting the arms depending from the rock-shafts with the cultivator-gangs, and means for oscillating the rock-shafts.

6. In a riding-cultivator, a main supporting-frame, rock-shafts supported for oscillation upon the side members of said frame each of said rock-shafts being provided with a plurality of depending arms and with a lateral inwardly-extending arm, a plurality of laterally-movable frames, cultivator-gangs engaging said frames for bodily vertical adjustment, links connecting the arms depending from the rock-shafts with the cultivator-gangs, foot-levers connected with one of the laterally-movable frames, and links connecting said foot-levers with the lateral inwardly-extending arms of the rock-shafts.

7. In a riding-cultivator, a main supporting-frame, rock-shafts supported for oscillation upon the side members of said frame each of said rock-shafts being provided with a plurality of depending arms, a plurality of laterally-movable frames, cultivator-gangs engaging said frames for bodily vertical adjustment, links connecting the arms depending from the rock-shafts with the cultivator-gangs, means for effecting lateral adjustment of the cultivator-gangs with relation to the laterally-movable frames, and means for oscillating the rock-shafts.

8. In a riding-cultivator, an arched axle and a main frame supported thereon, a laterally-movable arch-frame supported upon the axle-arch, a laterally-movable traveler-frame supported upon the main frame and including a pair of clevis-blocks and a connecting-bar with which said clevis-blocks are adjustably connected, cultivator-gangs having upwardly-extending members in slidable engagement with perforations in said clevis-blocks, guide-loops adjustably connected with the cultivator-gangs and slidably engaging the vertical members of the laterally-movable arch-frame, rock-shafts supported for oscillation upon the side members of the main frame, arms depending from rock-shafts near the front and rear ends of the latter, links connecting said depending arms with the cultivator-gangs, and means for oscillating the rock-shafts.

811,134. SPROCKET-WHEEL. ALBERT G. DUPOUR, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed July 15, 1905. Serial No. 269,533.



Claim.—1. A sprocket-wheel for use in cable-power-transmission apparatus provided with a series of sections in which are formed cable-seats and with gaps between the sections, the seat for the cable in each section having its longitudinal intermediate portion disposed outside of a circle concentric with the axis of revolution of the wheel and including the points of contact of the cable with the ends of the sections, substantially as set forth.

2. A sprocket-wheel for use in cable-power-transmission apparatus provided with a series of sections in which are formed cable-seats and with gaps between the sections, the cable-seat in each section being formed on the arc of a circle of less radius than the radius of a circle struck from the axis of revolution of the wheel and including any part of the said cable-seat, substantially as set forth.

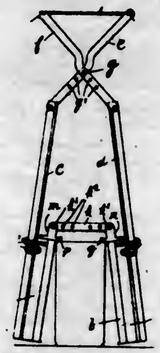
3. A sprocket-wheel for use in cable-power-transmission apparatus provided with a series of sections in which are formed cable-seats and with gaps between the sections, the cable-seat in each section being on the arc of such a circle that a straight line crossing the gap from the contact-point *k* of that section to the contact-point *k* of the next section is tangential to such arc, substantially as set forth.

4. In combination with a flexible driving device having wheel-engaging attachments, a wheel whose periphery is divided into sections by gaps or recesses for the said wheel-engaging devices each of said sections between the recesses having a peripheral seat which lies outside of the circle that passes through the driving-points at the ends of the said sections, substantially as set forth.

811,135. CONCRETE-MOLD. FREDERIC M. SIMMONS, Brookline, Mass. Filed Sept. 8, 1905. Serial No. 277,491.

Claim.—1. A concrete-mold comprising a pair of side plates pivotally connected adjacent their upper edges to swing to and from each other, arms rigidly connected to said plates and extending upwardly therefrom, two oppositely-disposed locking-levers each pivotally connected at one end to one of said arms and to each other at an intermediate point, substantially as described.

2. A concrete-mold comprising a pair of side plates pivotally connected adjacent their upper edges to swing to and from each other, arms rigidly connected to said plates and extending upwardly therefrom, two oppositely-disposed locking-levers each pivotally connected at one end to one of said arms and to each other at a point approximately midway between said plates, substantially as described.



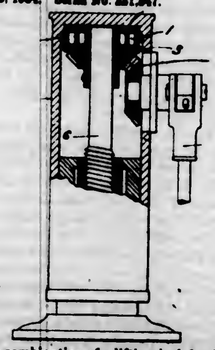
3. A concrete-mold comprising a pair of side plates, a link pivotally connected at each end to said plates to permit said plates to be swung to and from each other, rigid arms connected to said plates and extending upwardly therefrom, and two locking-levers, each pivotally connected at one end to one of said arms and pivotally connected to each other midway between said arms, substantially as described.

4. A concrete-mold comprising a pair of side plates pivotally connected at their upper edges to swing to and from each other, a pair of heads adapted to be held between said plates, projections on said plates adapted to engage the upper ends of said heads, and means for locking said plates against the side edges of said heads, substantially as described.

5. A concrete-mold comprising a pair of side plates pivotally connected adjacent their upper edges to swing to and from each other, arms rigidly connected to said plates and extending upwardly therefrom, two oppositely-disposed locking-levers each pivotally connected at one end to one of said arms and to each other at an intermediate point, and a stop for supporting said levers in a position in which the pivotal connection therebetween is held at the center line of the pivots of said levers, substantially as described.

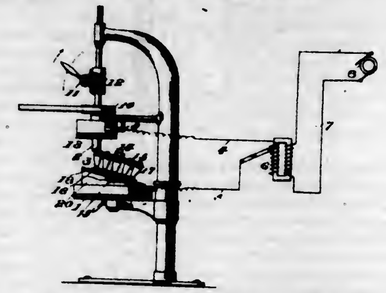
6. A concrete-mold comprising a pair of side plates pivotally connected adjacent their upper edges to swing to and from each other, means for locking said plates in a predetermined position, and supporting-lugs connected to said plates at their upper edges and adjacent each end, and extending toward each other beyond the inner faces of said plates, substantially as described.

811,186. LIFTING-JACK. SAMUEL S. BYELAND, Philadelphia, Pa. Filed Aug. 23, 1904. Serial No. 221,847.



Claim.—The combination of a lifting-jack having a screw and a movable part, a cage provided with radial openings, and cylindrical rollers arranged end to end and disposed in groups in said radial openings, substantially as described.

811,187. ELECTRIC RIVETER. SAMUEL S. BYELAND, Philadelphia, Pa. Filed Sept. 13, 1904. Serial No. 224,343.



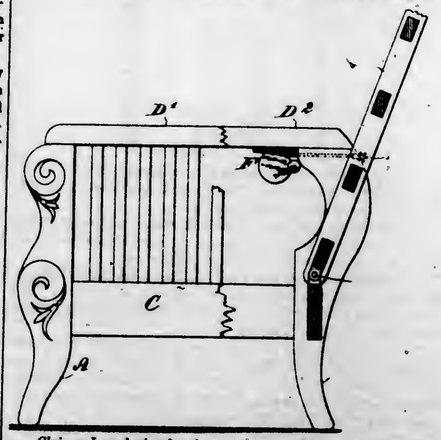
Claim.—1. An electric riveter provided with an electrode constituting a header, and means for rotating the electrode in substantially the same spot on the rivet whereby the heating effect is localized.

2. An electric riveter provided with an electrode constituting a header, means for rotating said electrode to localize the heating effect near the end of a rivet, and devices for causing the electrode to contact with the end of the rivet to head up the locally-heated part thereof, substantially as described.

3. An electric riveter provided with an electrode constituting a header, means for rotating said electrode to localize the heating effect at the end of a rivet, an electrode constituting a support for the rivet, and devices for causing said electrodes to approach so as to head up the hot end of the rivet, substantially as described.

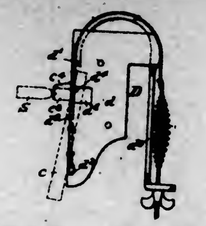
4. In combination a fixed and an axially-movable revoluble part, means for shifting and rotating the revoluble part, a heating-circuit including said parts, and a jig consisting of notched disks and an inclined spindle upon which they are revoluble, substantially as described.

811,138. ATTACHMENT FOR RECLINING-CHAIRS. MARTIN FAAS, New York, N. Y. Filed Jan. 11, 1905. Serial No. 240,608.



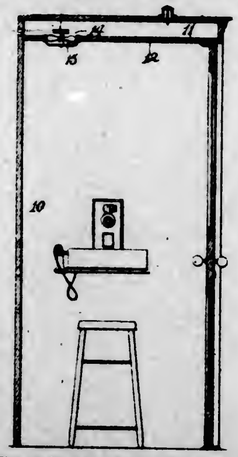
Claim.—In a device for the purpose specified, the combination with the case 1, provided with an attaching-plate and a removable front plate, of the socketed sheave 13 in said case, the flexible connector secured at one end to said sheave and extending out through an aperture in the case, the spring-arbor 7 mounted rotatably in the case and carrying said sheave, the spring 5 in the case and about said arbor, the J-shaped bolt 19, mounted slidably on the case and provided with a spring 21 and button 22, the operative end 19' of said bolt playing in an aperture in the case and adapted to engage the sockets in said sheave for locking the latter against rotation.

811,139. LOOM-SHUTTLE CHECK. HARRISON GARRETT, Northtown, Pa. Filed Dec. 7, 1904. Serial No. 235,921.



Claim.—A shuttle-check adapted to be applied to the lay of a loom, and comprising a support, a stud secured to said support, a semicircular rim projecting from said support, an angular extension contiguous to said rim, a strap secured with one end to said stud and laying over said rim, a spring attached with one end to the other end of said strap, just beyond the said rim, a threaded rod on the other end of said spring, said rod extending through the angular extension and a thumb-nut for adjusting the said spring, substantially as and for the purposes set forth

811,140. TELEPHONE OR OTHER BOOTH. EDITHE P. GARNET, Scranton, Pa. Filed Apr. 1, 1905. Serial No. 253,253.



Claim.—1. The combination with a telephone or similar booth, of a means for exhausting air from the booth, and means for breaking sound-waves in the exhaust-opening.

2. The combination with a booth having a ventilating-opening therein, of an exhaust-fan located in the opening and adapted to exhaust air from the booth and break up sound-waves.

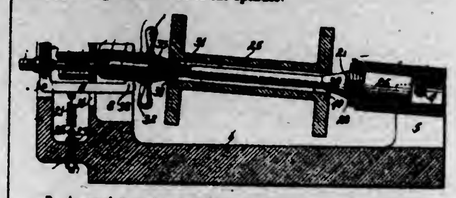
3. The combination with a booth having a ventilating-opening, of a device located in the opening to distribute sound-waves, and a valve arranged behind the sound-wave-breaking device and between the said device and the outer air.

4. The combination with a booth having a chamber in its walls with an opening leading into the said chamber from the booth and into the outer air from the said chamber, of a sound-wave-breaking device located in the opening between the chamber and the booth, and a valve in the outlet of the said chamber.

811,141. TENSION DEVICE. JOHN GOSS, New York, N. Y., assignor, by direct and mesne assignments, to The John Goss Corings Co., a Corporation of New York. Filed Sept. 26, 1904. Serial No. 225,552.

Claim.—1. A spool-carrying spindle, a rocking bearing for receiving the spindle-head and a tension device for supporting the free end of the spindle.

2. A spool-carrying spindle having a tapered head, a rocking bearing having a tapered bore for receiving the head, means for adjusting the position of the head with respect to the bearing and means for supporting the free end of the spindle.



3. A spool-carrying spindle having a tapered head and a screw-threaded portion adjacent thereto, a rocking bearing having a tapered bore for receiving the head, an adjusting-collar engaging the screw-threaded portion and the bearing for adjusting the position of the head within the bore and means for supporting the free end of the spindle.

4. A spool-carrying spindle having a tapered head, a rocking bearing having a tapered bore for receiving the head and a tension device for supporting the free end of the spindle.

5. A spool-carrying spindle having a tapered head, a screw-threaded portion and a fixed tapered seat adjacent to each other.

6. A spool-carrying spindle having a tapered head, a screw-threaded portion and a tapered seat adjacent to each other and another screw-threaded portion spaced therefrom and a removable tapered seat arranged to engage said last-named screw-threaded portion.

7. A spool-carrying spindle, a bearing for its head and a tension device for supporting the free end of the spindle comprising a rocking lever one arm of which supports the spindle and a sliding pin interposed between the end of the spindle and the other arm of the lever.

8. A spool-carrying spindle, a rocking bearing for its head and a tension device for supporting the free end of the spindle comprising a rocking lever, an adjusting-screw carried by one arm of the lever, the other arm of the lever serving to support the spindle and a sliding pin interposed between the adjusting-screw and the end of the spindle.

9. A spool-carrying spindle, a rocking bearing for receiving the spindle-head and a tension device for supporting the other end of the spindle comprising a thrust-block on the free end of the spindle, a spring-actuated rocking lever one arm of which engages the bottom of the thrust-block and a spring-actuated sliding pin interposed between the other arm of the lever and the thrust-block.

10. The combination with a suitable base, of a spool-carrying spindle, a rocking bearing carried by the base for receiving the head of the spindle, an upright having a vertical recess therein, a thrust-block carried by the free end of the spindle located within said recess and a spring-actuated tension device engaging the thrust-block for supporting the free end of the spindle.

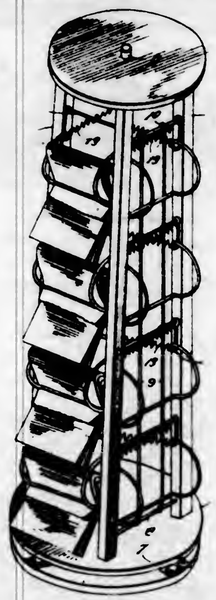
811,142. PAPER-BAG RACK. XAVIER C. HALBERT, Clarendon, La. Filed Apr. 27, 1905. Serial No. 257,776.

Claim.—1. A paper-bag rack or holder comprising a plurality of oppositely-disposed spaced bars, horizontal bars connecting respective spaced bars of the holder, clamps pivoted to said horizontal bars, and springs connecting oppositely-arranged clamps.

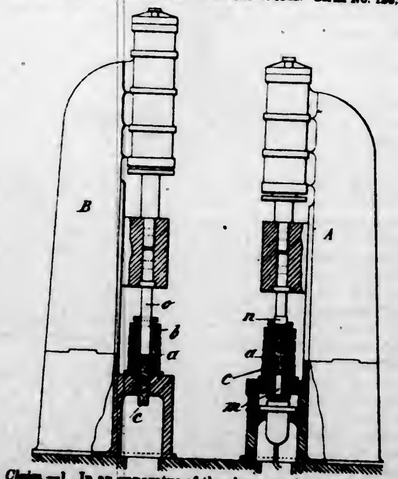
2. A paper-bag rack or holder comprising a plurality of oppositely-disposed spaced bars, horizontal bars connecting respective spaced bars of the holder, clamps pivoted to the horizontal bars of the holder and embodying spaced sides, and springs connecting the sides of oppositely-arranged clamps.

3. A paper-bag rack or holder comprising a plurality of oppositely-disposed spaced bars, horizontal bars connecting respective spaced bars of the holder, clamps pivoted to said horizontal bars, springs connecting oppositely-arranged clamps, and a plurality of vertical rods connecting the several horizontal bars at the sides of the holder and cooperating with the clamps as specified.

4. In a paper-bag rack or holder, the combination of a holder or rack embodying a plurality of spaced vertical bars, horizontal bars connecting the spaced bars at intervals in their length, clamps comprising sides provided at terminals with loops receiving the horizontal bars aforesaid and affording pivotal connection therewith, said sides being formed with loops between the ends thereof, springs connected with the loops, the sides of the clamps being curved outwardly from the sides of the rack or holder, vertical rods connecting the several horizontal bars at each side of the holder and cooperating with the clamps, and springs connected at ends thereof with the loops between the ends of the sides of oppositely-disposed clamps carried by the vertical bars of the holder.



811,143. COMPRESSING STEEL IN CONICAL MOLDS. HENRI HARBERT, St. Etienne, France. Filed Oct. 7, 1902. Serial No. 126,294.



Claim.—1. In an apparatus of the character described, a vertical ingot-mold having a slightly conical cavity, means forming the continuation for the smaller end of said mold at the base and wherein an ingot is adapted to be solidified by compression when forced out through said mold and the means forming the continuation of the smaller end of said mold.

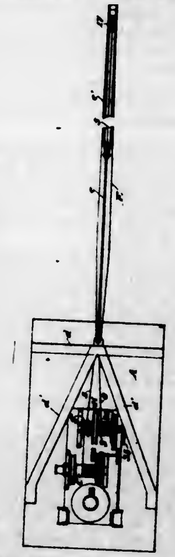
2. In an apparatus of the character described, a slightly frusto-conical ingot-mold, a hollow block arranged adjacent to and forming the continuation for the smaller end of said ingot-mold, and the hollow portion of said block having successive cylindrical frusto-conical and cylindrical portions.

3. In an apparatus of the character described, a vertical ingot-mold having a slightly conical cavity, the smaller diameter of which is at the base of the mold, a hollow block for centering and supporting the mold at its base having a highly conical portion located between two cylindrical portions, forming the continuation of the cavity of the mold to still further compress and to solidify the ingot when forced out of the cavity of the mold into and through said hollow block.

4. In an apparatus of the character described, a slightly frusto-conical ingot-mold, a hollow block arranged adjacent to and forming the continuation for the smaller end of said ingot-mold, the hollow portion of said block having successive cylindrical frusto-conical and cylindrical portions, to further compress the ingot forced through the successive portions of said block, in combination with means for circulating a cooling medium in said block during passage of the ingot therethrough.

5. In an apparatus of the character described, a slightly frusto-conical ingot-mold for solidifying an ingot by compression, a hollow block arranged adjacent to and forming the continuation for the smaller end of said ingot-mold, the hollow portion of said block having successive frusto-conical and cylindrical portions to further compress the ingot when forced into and through said block; in combination with means for circulating a cooling medium in said block during the passage of the ingot therethrough, and pushing of the ingot back through said block.

811,144. HOISTING AND CONVEYING APPARATUS. JUDSON HAYWARD, New York, N. Y. Filed Mar. 25, 1905. Serial No. 251,966.



Claim.—1. The combination of a receptacle adapted to be opened and closed, a holding-line supporting said receptacle, a closing-line, a drum member to which said holding-line is secured, a second drum member around which the closing-line is wrapped and a third drum member to which one end of the closing-line is secured.

2. The combination of an engine, a load-receptacle adapted to open and close, a holding-line for said receptacle, a line connected to the engine for closing said receptacle, and means for maintaining the holding-line against movement while paying out on the closing-line to permit the opening of the receptacle, said means comprising two drum members around one of which is wrapped the holding-line and around the other of which is wrapped the closing-line, said closing-line extending back to the engine as aforesaid.

3. The combination of a receptacle adapted to open and close, a closing-line connected with the operating mechanism of the receptacle, a drum for actuating said closing-line, a second drum member interposed between the receptacle and the first-mentioned drum and around which the closing-line is wrapped, and a holding-line for said receptacle.

4. The combination of a receptacle adapted to open and close,

an engine, a two-part friction-drum between the engine and the receptacle, a holding-line supporting said receptacle and having an end portion secured to one part of the friction-drum, a closing-line connected to said receptacle, and passing about the other part of said friction-drum and having an end secured to the engine, and means for engaging and disengaging the two parts of said friction-drum.

5. The combination of a receptacle adapted to open and close, an engine, a friction-drum between the engine and receptacle, a holding-line connected to said receptacle and to the friction-drum, and a closing-line extending from the receptacle to the drum and thence to the engine.

6. The combination of an engine, a load-receptacle adapted to open and close, a line connected with the operating mechanism of the receptacle, a holding-line connected to the head of said receptacle, a two-part friction-drum to which both of said lines are connected, means for throwing the parts of said drum into and out of engagement, to actuate both of said lines simultaneously, and at different times, respectively, braking mechanism for holding one of said drum parts against movement, and a third drum to which one end of the first-mentioned line is connected.

7. The combination of an engine, a two-part friction-drum, a load-receptacle, a supporting-line extending from the receptacle to one part of the friction-drum, a closing-line extending from said receptacle to the other part of said drum and thence to the engine, means for throwing the two parts of the drum into and out of engagement to operate said ropes simultaneously and at different times, respectively, and supplemental mechanism for actuating one part of said drum independent of the other part and of the engine.

8. The combination of an engine, a two-part drum, a load-receptacle, a supporting-line connected to said receptacle and to one part of said drum, a closing-line extending from the receptacle to the other part of said drum and thence connecting said second part of the drum with the engine, means for connecting said drum parts to cause both to be driven simultaneously with the engine, and independent means for actuating one part of said drum independent of the other.

9. The combination of a frame, including a boom, an engine for said frame, a load-receptacle at one end of the boom, a supporting-line connected to said receptacle and passing over the boom, an actuator to which said supporting-line is secured, and a second line extending from said receptacle to the boom thence to the actuator and thence to the drum of the engine.

10. The combination of an engine, a sectional bucket, mechanism for operating said sections, an actuator located between the engine and said receptacle, a line extending from the operating mechanism of the bucket to said actuator and thence to the engine, and a second line connecting the frame of said bucket with the actuator.

11. The combination of a sectional bucket, and means for operating said bucket to permit the opening and closing of same comprising an engine, a drum member and a line extending from said engine to the drum member and thence to the operating mechanism of the bucket.

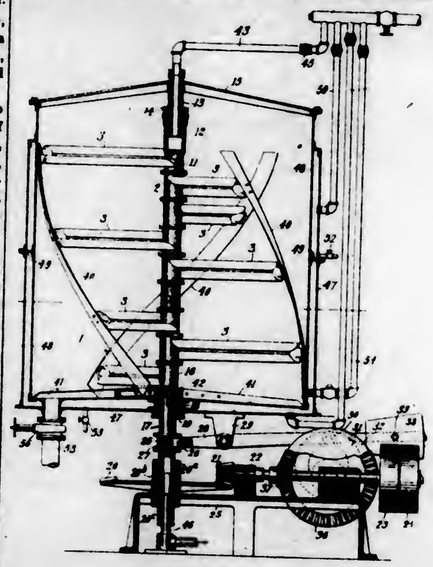
12. The combination of a receptacle, an engine, an actuator comprising a two-part drum, a line extending from said receptacle to one part of the drum and secured thereto, a second line extending from the receptacle to the other part of said drum and thence to the engine, means for engaging and disengaging the parts of the drum, and means connected to one section of the drum for rotating the same independent of the other, such means comprising a rack-and-pinion mechanism.

13. The combination of a receptacle, an engine, a two-part friction-drum, means for engaging and disengaging the parts of said drum, a line extending from said bucket to one part of said drum, a second line extending from said bucket to the other part of said drum and thence to the engine, and means for holding one part of said drum stationary while the other part is driven from the engine to operate its line.

811,145. MIXING APPARATUS. CHARLES S. HUGHES, New York, N. Y., assignor to The Mixing and Manufacturing Company, New York. Filed Feb. 20, 1905. Serial No. 246,089.

Claim.—1. In an apparatus of the kind described, the combination of a suitable mixing-vat, a mixer therein comprising a hollow shaft having a plurality of arms or blades, a tubular spindle supported at the top of the vat and extending into the shaft, a bearing in the bottom of the vat through which the shaft extends, a flanged collar on the shaft below the vat, a lever having a fork engaging the collar, and a cam engaging the lever to oscillate the same, as set forth.

2. In an apparatus of the kind described, in combination a mixing-vat; means for heating part or all of the same at will; a mixer in the vat, comprising a hollow shaft and a plurality of hollow arms or blades in communication therewith; means for delivering a fluid heating medium to the hollow shaft; means for rotating the mixer; and means for simultaneously reciprocating the same, as set forth.



811,146. EMBROIDERING ATTACHMENT FOR SEWING-MACHINES. JOHN S. JACOBS, Dallas, Tex. Filed Mar. 31, 1905. Serial No. 253,126.

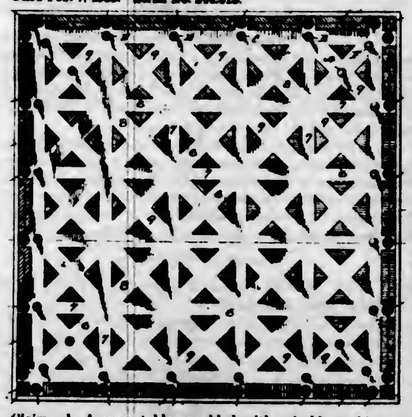
Claim.—1. An embroidery attachment comprising a length of wire bent to form the loop portion 7 adapted to receive the needle of a sewing-machine, said wire being extended from the loop portion 7 and formed into the spring 2, and thence extended from the spring 2 to form the approximately horizontal arm 3, the outer end portion of said arm being bent downwardly and thence outwardly to form the horizontal loop 4 constituting a presser-foot, the extremity of the arm 3 adjacent the loop 4 being bent upwardly from the loop alongside the arm 3 and terminating at a side of the arm, in contact therewith, some distance above the loop 4, and means for securing the attachment to a machine.

2. As a new article of manufacture, an embroidery attachment for sewing-machines consisting of a single length of wire 1 having an end portion formed into the loop portion 7 for the insertion of the needle extended laterally from said loop portion to form the extension 8 having the outer end thereof bent to form the spring 9 and extended back toward the loop portion to form the spring-engaging member 10 deflected between its ends to form the seat 11 and having its extremity projected laterally to form the finger-piece 15, the wire 1 being extended from the loop portion 7 and formed into the spring 2, and thence extended from the spring 2 to form the approximately horizontal arm 3 having its outer end bent downwardly and extended to form the horizontal loop 4 constituting a presser-foot, the extremity of the arm 3 adjacent the loop 4 being bent upwardly therefrom and terminated at a side of the arm 3.

811,147. GEARING. HENRY F. JAMES, Franklin, Pa. Filed Aug. 17, 1904. Serial No. 221,003.

Claim.—In a device of the class specified, a bed, a vertical stub-shaft mounted therein, a horizontal worm-wheel, provided with a bearing upon its lower face, mounted upon said stub-shaft, a worm mounted in said bed, in mesh with said wheel, said bed being adapted to contain oil for the immersion of said wheel and worm, a shield or cover for said bed, all substantially as shown and described.

811,148. GAME-TABLE. MARTIN M. JOHNSON, Greenville, Ohio. Filed Feb. 7, 1905. Serial No. 244,615.



Claim.—1. A game-table provided with suitable cushions arranged along each of its sides, pocket-openings therethrough, pockets disposed within the pocket-openings and partitions forming passage-ways registering with the pocket-openings and properly proportioned for the passage therethrough of balls.

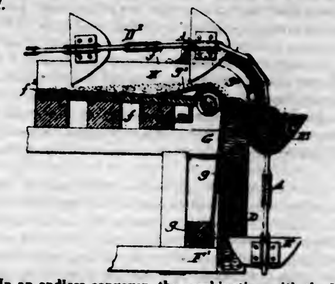
2. In a game-table upon which balls are to be impelled, suitable cushions arranged and differently colored along each of its sides and provided with a plurality of pocket-openings therethrough, a pocket disposed within each of said pocket-openings and buffers arranged upon the table to form passage-ways, said passage-ways being arranged to register with the pocket-openings and proportioned to permit the passage of a ball.

3. In a game-table upon which balls are to be impelled, suitable cushions arranged and differently colored along each of its sides and provided with a plurality of pocket-openings therethrough, a pocket disposed within each of said pocket-openings and resilient buffers geometrically arranged upon the surface of said table to form passage-ways and so disposed that the passage-ways register with the pocket-openings.

4. A game-table apparatus comprising a table, suitable cushions arranged and differently colored along each of its sides and provided with a plurality of pocket-openings therethrough, a ball-receiving pocket disposed within each of said pocket-openings, a plurality of triangular-shaped buffers arranged upon the surface of the table and to form a plurality of ball passage-ways parallel with each of the table sides and others extending obliquely thereto and a plurality of series of balls, each series colored to correspond with the color of one of the side cushions and equal in number to the pocket-openings in each cushion.

811,149. CONVEYER. WALLACE B. JOHNSON, Chicago, Ill., assignor to Fairbanks, Morse & Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 23, 1905. Serial No. 242,051.

Claim.—1. In an endless conveyer, the combination with the buckets, the endless carrier therefor, and the guiding devices for the upper horizontal flight of the carrier, of the take-off chute for receiving the material from the buckets as they turn from their vertical to their horizontal run, and the vertically-disposed yielding plate arranged adjacent to the line of travel of the inner sides of the buckets, and having its upper end extending over the adjacent end of the said take-off.



2. In an endless conveyer, the combination with the buckets, the endless carrier therefor, and the guiding device for the upper horizontal flight of the carrier, of the chute arranged adjacent to the guiding device at the point where the buckets turn from their vertical to their horizontal run and along which the material is advanced by the buckets, and the vertically-disposed yielding plate arranged adjacent to the line of travel of the buckets on their up-run, and having its upper end extending over the bottom plate of said chute.

3. In an endless conveyer, the combination with the buckets, the endless carrier therefor, the head-wheels for the carrier adapted to direct it from its up-run to the horizontal run, and the shaft upon which the said wheels are mounted, of the take-off chute having one end arranged adjacent to the said shaft, and the vertically-disposed yielding plate arranged adjacent to the line of travel of the inner sides of the buckets and having its upper end curved over the said shaft and overlapping the adjacent end of the said take-off.

4. In an endless conveyer, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and the shaft for the said wheels, of the vertically-disposed plate arranged at an inclination to the line of travel of the inner sides of the buckets and having its upper end curved about the said shaft and free to yield relatively thereto, and the take-off device adapted to receive the material from the upper end of said plate.

5. In an endless conveyer, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and the shaft for said head-wheels, of the plate arranged at an angle to the line of travel of the inner sides of the buckets, and having its lower end the more remote from said line and its upper end curved about the said head-shaft, the said plate being movable relative to the said head-shaft.

6. In an endless conveyer, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and the shaft for said head-wheels, of the plate arranged at an angle to the line of travel of the inner sides of the buckets, and having its lower end the more remote from said line and its upper end curved about the said head-shaft, the said plate being mounted so that its upper end can yield relatively to said head-shaft.

7. In an endless conveyer, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and the shaft for said head-wheels, of the plate arranged at an angle to the line of travel of the inner side of the buckets, and having its lower end the more remote from said line and rigidly secured in position, and its upper end curved about the said head-shaft and free to yield relatively thereto.

8. In an endless conveyer, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and a shaft for said head-wheels, of the take-off chute having a bottom wall with one end arranged adjacent to the said head-shaft, and the side walls extending upwardly from said bottom wall, and being extended about the said head-shaft and downwardly on either side of the up-run of the said series of buckets, and the vertically-disposed yielding plate arranged between said downwardly-extending side walls and adjacent to the line of travel of the inner sides of the buckets, and having its upper end curved over the said shaft and overlapping the adjacent end of the bottom wall of the chute.

9. In an endless conveyor, the combination with the series of buckets, the endless carrier therefor, the head-wheels for directing the carrier from its up-run to a substantially horizontal run, and a shaft for said head-wheels, of the take-off chute having a bottom wall with one end arranged adjacent to the said head-shaft, and the side walls extending upwardly from said bottom wall, and being extended about the said head-shaft and downwardly on either side of the up-run of the said series of buckets and flared outwardly therefrom, and the vertically-disposed yielding plate arranged between said downwardly-extending side walls and adjacent to the line of travel of the inner sides of the buckets, and having its upper end curved over the said shaft and overlapping the adjacent end of the bottom wall of the chute.

10. In an elevator, the combination of an endless carrier arranged to travel around a path having different parts or sections, of which one is inclined to the next, a carrier supporting and guiding device adapted to deflect the carrier from one part of said path to the next, buckets secured to the said carrier, and a guard-wall or fender on the inner side of the carrier supported at points where the carrier is deflected as aforesaid and adapted to yield or move inward and outward in relation to the path of the buckets as the buckets travel past said guard or fender, substantially as set forth.

11. In an elevator, the combination of an endless carrier arranged to travel around a path having different parts or sections, of which one section is inclined to the next, a carrier supporting and guiding device adapted to deflect the carrier from one part of said path to the next, buckets secured to the said carrier, and a guard-wall or fender on the inner side of the carrier supported at points where the carrier is deflected as aforesaid, and formed in two parts or sections, one of which is arranged approximately parallel to one part or section of the carrier-path, and the other arranged approximately adjacent to the other section of the carrier-path, said guard-wall or fender being adapted to yield or move inward toward and outward from the axis around which the carrier is deflected, substantially as set forth.

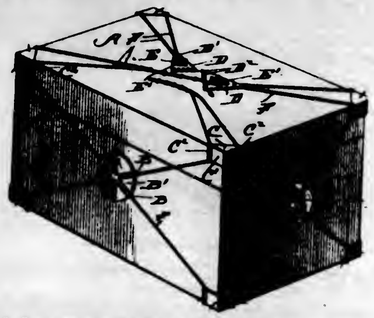
12. In an elevator, the combination of a supporting-frame, the endless carrier arranged to travel through an approximately vertical path and then through an approximately horizontal path, head-wheels or guides for the carrier when it passes from one of said paths to the other, a receiving chute or trough adjacent to the approximately horizontal part of the carrier, supports for said chute connected thereto and extending around the axis of the head-wheels and then downward therefrom and rigidly secured to the supporting-frame, and a guard-wall or fender on the inner side of the path of the buckets and adapted to yield inward toward and outward from the axis of said head-wheels, and extending from points adjacent to the upper horizontal path of the buckets around the axis of the head-wheels and downward on lines adjacent to the approximately vertical part of the carrier, substantially as set forth.

13. In a conveyer, the combination of an endless carrier arranged to travel around a path having different parts or sections of which one is inclined to the next, supporting and guiding devices adapted to guide and direct the said carrier from one of its paths to the next, a series of conveyer elements secured to said carrier, and a guard-wall or fender on the inner side of said carrier adjacent to one of the points at which the said carrier is deflected from one of its paths to the next and adapted to move or yield inward and outward in relation to the path of the said conveyer elements as they travel past said guard-wall or fender.

14. In a conveyer, the combination of an endless carrier, arranged to travel around a path having different parts or sections, of which one is inclined to the next, supporting and guiding devices adapted to guide the said carrier from one of its paths to the next, a series of conveyer elements secured to said carrier, a chute or trough arranged adjacent to said carrier at one of the points at which the said carrier is deflected from one of its paths to the next and along which the said conveyer elements travel, and a guard-wall or fender arranged adjacent to the inner sides of said conveyer elements along the path from which they are deflected to pass over said chute or trough and having one end extending over the receiving end of said chute or trough, said guard-wall or fender being adapted to move inward and outward in relation to the path of the conveyer elements as they travel past said guard-wall or fender.

811,150. TRUSS-GIRDER. WARNE L. EMMET, Rogue, Ter. Filed Apr. 22, 1905. Serial No. 256,209.

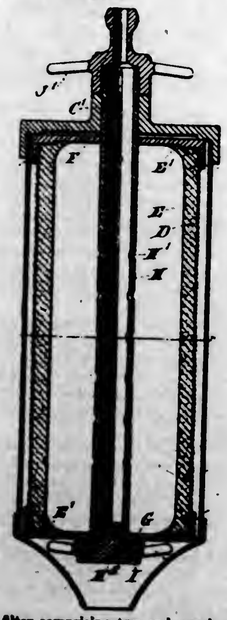
Claim.—1. A device of the kind described comprising a metal cap, formed of a triangular plate having converging sides of greater length than the sides of the plate, the said sides being turned back at their divergent end portions to form sleeves.



2. In a truss-corder the combination with corner-caps having sleeves thereon, a V-shaped plate, a pulley carried by the said plate, one side of said plate being notched, cords passing through the sleeves of the corner-caps and over the pulleys, one end of each of said cords being secured to the apex of the plate and the other end in detachable engagement with the notched side of the plate.

3. A device of the kind described comprising a plurality of plates having intersecting bores, corner-caps having a plurality of sleeves, V-shaped plates having pulleys, and a plurality of cords secured at one end of said plates, the said cords being adapted to pass through the sleeves of the corner-caps and the bores of the plates and to have their free ends detachably secured to the said V-shaped plates.

811,151. FILTER. GEORGE M. KEBLER, New York, N. Y. Filed May 17, 1905. Serial No. 260,833.



Claim.—1. A filter comprising two end members or heads, a perforated mantle extending from one head to the other, and a pulp lining on the inner surface of said mantle, the ends of the lining engaging the heads to form tight joints therewith, and the inner surface of the lining being exposed so that the inward expansion of the pulp lining is unrestricted.

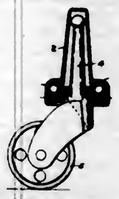
2. A filter comprising two end members or heads, a perforated inlet-pipe connecting said head, a perforated mantle extending from one head to the other, a shell surrounding said mantle and having an outlet, and a pulp lining on the inner surface of said mantle, the ends of the lining engaging the heads to form tight joints therewith, and the inner surface of the lining being exposed so that the inward expansion of the pulp lining is unrestricted.

3. A filter comprising two end members or heads beveled on their inner surfaces, a perforated mantle extending from one head to the other end engaging said beveled surfaces, and a filtering-lining on the inner surface of said mantle.

4. A filter comprising two end members or heads, a perforated mantle extending from one head to the other, and a filter-lining on the inner surface of the mantle and extending into the perforations thereof, the ends of the lining engaging the heads to form tight joints therewith, and the inner surface of the lining being exposed so that the inward expansion of the pulp lining is unrestricted.

5. A filter comprising two end members or heads, a perforated pipe connecting them, a perforated mantle surrounding the pipe and extending from one head to the other, a filter-lining on the inner surface of the mantle, a cap engaging one of said heads, means for pressing said cap toward the heads, and a shell connected with said cap and surrounding the mantle.

811,152. BALL-BEARING CASTER. OLIVER C. KNIPE, Norristown, Pa., assignor to The Pressed Steel Manufacturing Company, a Corporation of New Jersey. Filed Feb. 13, 1903. Serial No. 143,147.

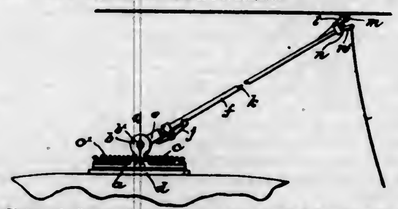


Claim.—1. As an article of manufacture, a ball-bearing support for a caster comprising a ball-cup, a soft-metal jacket attached thereto, a series of balls in the cup, a perforated cone engaging the same, the jacket being provided with an integral incurled flange to act as a cone-retainer, and means adapted to permit mounting the caster-support on an article of furniture.

2. As an article of manufacture, a ball-bearing support for a caster comprising a hollow socket to receive a roller-stem, a ball-cup carried by the lower end of the socket, an inclosed cone and a series of balls mounted to turn freely in the cup, and a soft-metal jacket provided with an inturned integral flange to permanently secure the cone within the cup.

3. A ball-bearing caster comprising a tubular socket having a ball-cup at its lower end, a perforated cone and series of balls permanently inclosed in the ball-cup, a soft-metal jacket having an integral flange to retain the cone, and a roller having a stem set in the cone and projecting into the socket.

811,153. TROLLEY-POLE. JOHN R. LAGERGREN, New York, N. Y. Filed May 25, 1905. Serial No. 262,179.



Claim.—1. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, an automatic friction lock or clutch mechanism whereby said pole is normally locked in relation to said base, a movable trolley-head, and means actuated by said trolley-head whereby pressure on said head will release said lock or clutch.

2. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, a friction-drum carried by said base, a friction-brake carried by said pole, means whereby said brake is normally set, a movable trolley-head and means actuated by said trolley-head whereby pressure on said head will release said brake.

3. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, a friction-drum carried by said base, a friction-band encircling said drum, provided with projected ears, a plate pivoted to said ears respectively, means whereby said plate may be actuated by said pole to close said band, a movable trolley-head, and means actuated by said trolley-head whereby pressure on said head will actuate said plate to release said band.

4. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, a friction-drum carried by said base, a friction-band encircling said drum provided with projected ears, a plate pivoted to said ears respectively, an arm on said plate projected into and engaging said pole, whereby upward movement of said arm by said pole will close said band, a movable trolley-head, and means actuated by said trolley-head whereby pressure on said trolley-head will actuate said plate to release said band.

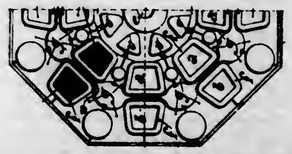
5. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, an automatic friction lock or clutch mechanism whereby said pole is normally locked in relation to said base, a rod mounted on said pole, a spring whereby said rod is normally projected beyond said pole, a pivoted trolley-head engaging said rod, and means whereby pressure on said trolley-head will through the depression of said rod, release said lock or clutch mechanism.

6. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, an automatic friction lock or clutch mechanism whereby said pole is normally locked in relation to said base, a rod mounted on said pole, a spring whereby said rod is normally projected beyond said pole, a bell-crank lever, the opposite arms of which are respectively adapted to receive a trolley-wheel and to engage said rod, and means whereby pressure on said trolley-head will through the depression of said rod release said lock or clutch mechanism.

7. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, a friction-drum carried by said base, a friction-band encircling said drum provided with projected ears, a plate pivoted to said ears respectively, an arm on said plate projected into and engaging said pole whereby upward movement of said arm by said pole will close said band, and project said plate from said pole, a rod mounted on said pole, a spring whereby said rod is normally projected beyond said pole, a lever mounted on said pole, the opposite arms thereof respectively engaging said plate, and being beveled to be actuated by said rod, and a pivoted trolley-head engaging said rod whereby pressure on said trolley-head will through the depression of said rod actuate said lever to release said band.

8. In a trolley-pole, the combination of a base, a spring-pressed pole mounted thereon, a friction-drum carried by said base, a friction-band encircling said drum provided with projected ears, a plate pivoted to said ears respectively, an arm on said plate projected into and engaging said pole whereby upward movement of said arm by said pole will close said band, and project said plate from said pole, a rod mounted on said pole, a spring whereby said rod is normally projected beyond said pole, a lever mounted on said pole, the opposite arms thereof respectively engaging said plate and being beveled to be actuated by said rod, and a bell-crank lever mounted on said pole, the opposite arms of which are respectively adapted to receive a trolley-wheel and to engage said rod and have a rope secured thereto, whereby pressure on said trolley-head will through the depression of said rod actuate said lever to release said band.

811,154. DYNAMO-ELECTRIC MACHINE. PIERRE A. J. LAFFARGUE, Paris, France. Filed Feb. 8, 1904. Serial No. 192,691.



Claim.—1. In a dynamo-electric machine the combination of means for producing a magnetic field, a stationary armature and windings therefor so placed as to always lie in the magnetic field, a revoluble armature and windings therefor adapted to enter and leave the magnetic field during the movement of revolution, and means for supporting the fixed and revoluble parts.

2. In a dynamo-electric machine the combination of a plurality of poles and windings therefor adapted to form a magnetic field, a stationary armature having a corresponding number of poles and windings therefor, said poles so placed as to lie in the magnetic field, a revoluble armature having also a corresponding number of poles

and windings therefor, the said poles being adapted to enter and leave the magnetic field during the rotation of the armature, and means for supporting the fixed and revoluble parts.

3. In a dynamo-electric machine the combination of a plurality of poles and windings therefor adapted to form a magnetic field such that the poles stand in a circle and each pole is of opposite sign to the two adjacent poles, a stationary armature having a corresponding number of poles and windings therefor so placed as to lie in the magnetic field, a revoluble armature having also a corresponding number of poles and windings therefor, the said poles adapted to enter and leave the magnetic fields during the rotation of the armature, and means for supporting the fixed and revoluble parts.

4. In a dynamo-electric machine the combination of a pair of end pieces, a plurality of poles mounted to project inwardly in a circle from each end piece in such a way that the poles are opposite one to another with spaces between them, windings on the poles such that when the machine is working the opposite poles shall be of opposite sign, and each pole shall be of opposite sign to those adjacent to it on the same plate, a stationary armature comprising a plurality of cores and windings therefor, one adapted to lie in the field between each pair of field-poles, a revoluble armature having a corresponding number of poles and windings therefor, the said poles adapted to enter and leave the magnetic fields during the rotation of the armature, and means for supporting the fixed and revoluble parts.

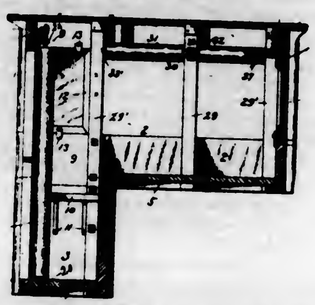
5. In a dynamo-electric machine the combination of a pair of end pieces, a plurality of poles mounted to project inwardly in a circle from each end piece in such a way that the poles are opposite one to another with spaces between them, windings on the poles such that when the machine is working the opposite poles shall be of opposite sign, and each pole shall be of opposite sign to those adjacent to it on the same plate, a stationary armature comprising a plurality of cores and windings therefor, one adapted to lie in the field between each pair of field-poles, a revoluble armature having a corresponding number of poles and windings therefor, the said poles adapted to enter and leave the magnetic fields during the rotation of the armature, while the cores of the stationary and revoluble armatures are so shaped that a pair of cores may lie and fit as nearly as possible between the opposite field-poles, and means for supporting the fixed and revoluble parts.

6. In a dynamo-electric machine the combination of two sets of field-magnet poles arranged in circles standing opposite to one another in pairs, a stationary armature comprising a plurality of cores and windings therefor, one adapted to lie in the field between each pair of field poles, a revoluble armature having a corresponding number of poles and windings therefor, the said poles adapted to enter and leave the magnetic fields during the rotation of the armature, end pieces whereon the field-poles are mounted, plates arranged to circumferentially connect the end pieces, clamps upon said plates adapted to support the cores and coils of the fixed armature and to leave air-spaces between the latter, a wheel-body and clamps thereon adapted to support the cores and coils of the revoluble armature and to leave air-spaces between the latter, and means for admitting the circulation of air from the center of the machine outward.

7. In a dynamo-electric machine the combination of two sets of field-magnet poles arranged in circles standing opposite to one another in pairs, a stationary armature comprising a plurality of cores and windings therefor, one adapted to lie in the field between each pair of field-poles, a revoluble armature having a corresponding number of poles and windings therefor, the said poles adapted to enter and leave the magnetic fields during the rotation of the armature, the cores of the field-poles and of the armatures being laminated, those of the field-poles and of the stationary armature in a substantially radial direction and those of the revoluble armature in a substantially circumferential direction, and means for supporting the fixed and revoluble parts.

8. In a dynamo-electric machine the combination of a plurality of poles and windings therefor adapted to form a magnetic field, a stationary armature having a corresponding number of poles and windings therefor, said poles so placed as to lie in the magnetic field, a revoluble armature having also a corresponding number of poles and windings therefor, the said poles being adapted to enter and leave the magnetic field during the rotation of the armature, means for supporting the fixed and revoluble parts, and a commutator comprising two rings adapted to distribute current to the external circuit of the machine, and a partial ring in connection with each said ring, stationary brushes adapted to convey current from the armature-windings to said partial rings, and means for conveying motion for rotating the commutator from the revolving armature, whereby the commutator is rotated at such speed that the brush-contacts are changed at each change of polarity in the armature-windings, and means for supporting the fixed and revoluble parts of the machine.

811,155. WAGON-BODY. CHARLES LEAVITT, St. Johnsville, N. Y. Filed Aug. 4, 1905. Serial No. 272,704.



Claim.—1. In a wagon-body, the combination of a body consisting of a box 2, the rear portion of said body forming a downwardly-extending compartment 3, said body being formed with window-openings 12 and 14, a door-opening 6, and a top 6′; seats 10, secured to the inner faces of the walls; window-frames 12 and 14, removably secured to the side and front walls, and held in position by cleats 13, a cross horizontal track 16, secured to the inner face of a cross-brace 15^2, located at the upper end of the rear portion of said body; a door-bar 17, held in slidable suspension on said track; a loop 18, secured to the upper end of the said door-bar, and riding on said track; a roller 19, rotatably and vertically secured at the rear end of said body, the lower end of said roller working in a bearing 20, in the floor 4, of said compartment 3, its upper end terminating in a rod 21, passing through a perforation in a guide-brace 22, secured to the inner face of said cross-beam 15^2; a roll of canvas or other material 23, having one end secured to said door-bar 17, and its other to said roller 19; a coil of resilient wire 25, secured at one end to the inner face of said vertical wall; a cord 26, one end secured to the free end of said resilient wire, and its other end to said rod 21, and adapted to wind or unwind upon the said rod 21; a bolt 27, secured to said door-bar 17; a catch 28, secured to the inner face of a vertical wall 28^2, located at the extreme rear portion of my body, said catch adapted to receive and hold said bolt, substantially as shown and described and for the purposes set forth.

2. In a wagon-body, the combination of a body consisting of a box 2, the rear portion of said body forming a downwardly-extending compartment 3, said compartment having a door 6, in its rear end; two transversely opposite vertical walls 8 and 9, located at the rear portion of said body, provided with window-openings; windows 12, removably secured in said openings by cleats 13, holding said windows in place; braces 29, and beams 29′, extending vertically from the floor of said body; curtain-poles, consisting of two rollers 31, secured to said brace-beams; axle-rods 32, connecting said rollers together, the rear ends of said rods passing through staples 33^a, secured to said vertical beams 29′, their front ends journaled in bearings 35, and terminating in eyes 34; cords 36, secured at one of their ends in said eyes 34; coils of wire 38, terminating at their upper ends in integral arms 39, and at their lower ends in eyed arms 37, said eyed arms adapted to receive and hold the free ends of said cords 36; curtains 40, secured at one end to said rollers 31, their other ends secured to curtain-bars 41; forked hooks 42, secured to said curtain-bars, and buttons 43, secured to the outer faces of said box 2, said buttons adapted to receive and hold the lower ends of said forked hooks, substantially as shown and described and for the purposes set forth.

3. The combination of a body; a compartment extending downwardly from the rear end of said body; seats secured in said compartment; a roof covering two-thirds of the top front of said body, its rear end terminating in a vertical flange, and a roof secured to removable longitudinal beams, covering one-third of the top, rear end, of said body, the front end of said body terminating in a bight overlapping said vertical flange, substantially as shown and described and for the purposes set forth.

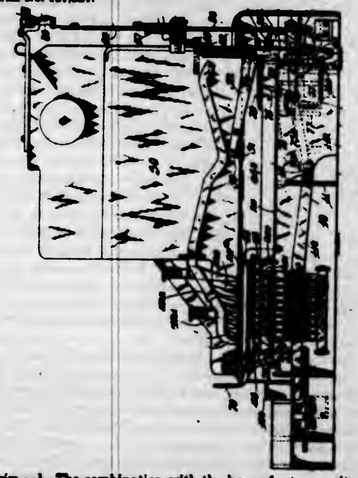
4. The combination of a wagon-body, having a rear downwardly-extending compartment; a door-opening formed in the rear wall of said body; a curtain secured in a roller, situated in one corner and the rear end of said body, actuated by a spring; a roll of canvas secured on said roller and adapted to be unrolled and close said door-opening; rollers, rotatably secured longitudinally, two on each side and near the roof of said body, said rollers actuated by springs; curtains having one end secured to said rollers, their outer ends to longitudinal bars, and adapted each to be hooked over a button, and thus close the sides of said body, substantially as shown and described and for the purposes set forth.

5. The combination of a wagon-body, having front and side window-openings; a window fitting in said front window-opening; fixed cleats, rigidly secured to the upper beam of said window-frame, holding said frame in said opening, substantially as shown and described and for the purposes set forth.

811,156. HEN'S NEST. FRANK LIEBER, Marquette, Mich., assignor of one-half to John J. Moriarty, Hudson, Mich. Filed May 24, 1904. Renewed Sept. 6, 1905. Serial No. 277,266.

Claim.—A hen's nest comprising a base-box, a supplemental inclined cloth floor suspended above the bottom of said box, a nest-box of shorter length than the base-box mounted upon one end of said base-box, a hinged lid covering the top portion of said base-box not covered by the nest-box, a circular dish-shaped nest arranged in said nest-box, and having an opening in its lower portion, a hinged plate covering said opening in the nest and having a decoy-egg thereon, and a weight connected with the hinged plate.

811,157. COMBINED ADDING AND TYPE-WRITING MACHINE. JASON C. LOTTERHAND, New York, N. Y. Filed July 20, 1903. Serial No. 167,857.



Claim.—1. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving them into such alinement.

2. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving them into such alinement, comprising a series of oscillators corresponding to the denominations of the numbers to be registered and added.

3. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving into such alinement any row of the adding-machine key-stems corresponding to a desired denomination.

4. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, means for moving into such alinement any row of the adding-key stems corresponding to a desired denomination, consisting of a reciprocating oscillator and means for moving it and limiting such movement.

5. The combination with the key-stems of an adding-machine, of a type-writing machine mounted over the adding-machine and comprising key-levers, key-stems, and key-heads, said type-writer keys having removable laterally-projecting rigid fingers in position to actuate the key-stems of the adding-machine.

6. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving into such alinement any row of the adding-machine key-stems corresponding to the initial denomination of the highest number to be recorded and added.

7. In a machine of the class described, the combination of the type-writer carriage, a finger-carriage, a lever intermediate the two carriages and adapted to be moved by the former to move the latter, the operating-bar of the adding-machine, means for disengaging the lever from the type-writer carriage brought into operation by the depression of said operating-bar, and means for holding it out of engagement.

8. The combination with the key-stems of an adding-machine, of the keys of a type-writing machine mounted over said stems whereby when the keys of the type-writer are struck the proper adding-machine key-stems are depressed, means for locating the adding zone at a predetermined point in the movement of the type-writer platen comprising the type-writer carriage, an adjustable leader thereon, a series of denomination-oscillators, means for actuating such oscillators, and a connection between said actuating means and said carriage.

9. The combination with the key-stems of an adding-machine, of the keys of a type-writing machine mounted over said stems whereby when the keys of the type-writer are struck, the proper adding-machine key-stems are depressed, and means for locking the parts actuated against further movement after the members to be added have been recorded by striking the keys of the type-writer

10. The combination with the key-stems of an adding-machine, of the keys of a type-writing machine, mounted over said stems whereby when the keys of the type-writer are struck, the proper adding-machine key-stems are depressed, and means for locking the parts actuated against further movement after the numbers to be added have been recorded by striking the keys of the type-writer and releasing the same only upon the completion of the adding operation.

11. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, means for moving into such alinement any row of the adding-machine key-stems corresponding to a desired denomination, consisting of a reciprocating oscillator and means for moving it and limiting such movement, and a permanent connection between all of the type-writer keys and the row of adding-machine key-stems corresponding to the initial denomination to be recorded.

12. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, means for moving into such alinement any row of the adding-machine key-stems and a plurality of permanent connections between all of the type-writer keys and each row of adding-machine key-stems corresponding to different denominations.

13. The combination with the key-stems of an adding-machine arranged in a series of rows, of the type-writing machine comprising key-levers, key-stems and key-heads mounted over the adding-machine key-stems, a permanently-attached connection located between the type-writer keys and the series of rows of the adding-machine key-stems, and a removable laterally-projecting rigid finger on each key-stem of the type-writer in position to depress said connection when the key is depressed.

14. The combination with the key-stems of an adding-machine, of the keys of a type-writing machine, mounted over said stems, whereby when the keys of the type-writer are struck the proper adding-machine key-stems are depressed, and means for suspending the adding operation while the decimal-point is being recorded on the type-writing machine comprising a step-bar offset at a predetermined point to arrest the movement of the type-writer carriage at a corresponding point.

15. The combination with a type-writer comprising keys and a

carriage and an adding-machine provided with key-stems, normally out of alinement with the type-writer keys, of means for moving into such alinement the row of the adding-machine key-stems corresponding to the highest denomination to be recorded and means for thereafter actuating the adding mechanism step by step as the type-writer carriage is moved to record the numbers struck by the type-writer keys.

16. The combination with a type-writer comprising keys and a carriage, and an adder comprising key-stems and registering mechanism, of means for uniting the two mechanisms simultaneously to record on the carriage and to register in the adder, numbers struck by the type-writer keys, comprising removable fingers on the type-writer keys, means for bringing a selected row of the adder-key stems, normally out of alinement with the type-writer key-fingers, into alinement therewith, and means for thereafter causing the type-writer mechanism and the adding mechanism to act in unison.

17. The combination with a type-writer comprising keys and a carriage and an adding-machine provided with key-stems, normally out of alinement with the type-writer keys, of means for moving into such alinement the row of the adding-machine key-stems corresponding to the highest denomination to be recorded, means for thereafter actuating the adding mechanism step by step as the type-writer carriage is moved to record the numbers struck by the type-writer keys, and means for automatically locking both type-writer and adding mechanisms against further movement.

18. The combination with a type-writer comprising keys and a carriage and an adding-machine provided with key-stems, normally out of alinement with the type-writer keys, of means for moving into such alinement the row of the adding-machine key-stems corresponding to the highest denomination to be recorded, means for thereafter actuating the adding mechanism step by step as the type-writer carriage is moved to record the numbers struck by the type-writer keys, means for automatically locking both type-writer and adding mechanisms against further movement and means for releasing the same.

19. The combination with a type-writer comprising keys and a carriage and an adding-machine provided with key-stems, normally out of alinement with the type-writer keys, of means for moving into such alinement the row of the adding-machine key-stems corresponding to the highest denomination to be recorded, means for thereafter actuating the adding mechanism step by step as the type-writing carriage is moved to record the numbers struck by the type-writer keys, and means for automatically locking both type-writer and adding mechanisms against further movement and releasing the same only upon completion of the adding operation.

20. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, and means for moving any row of said key-stems into said alinement consisting of an oscillating bar provided with a flexible connection with each of the key-stems in said row.

21. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving each row of said key-stems into such alinement, consisting of a plurality of oscillating bars each provided with a flexible connection with each of the key-stems in its row.

22. The combination with the keys of a type-writer of the keys of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys and means for moving them into such alinement, whereby when the keys of the type-writer are struck, the proper adding-machine key-stems are depressed, and a reciprocating bail transversely mounted across the rows of adding-key stems and forming a connection between the type-writer keys and said key-stems, whereby when the corresponding type-writer numeral-key is struck said bail is moved downward to depress the adding-machine key-stems in its path.

23. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, and means for moving them into such alinement, and a plurality of reciprocating bails, each transversely mounted across the rows of adding-machine key-stems, and forming a connection between the type-writer keys and said key-stems, whereby when the corresponding type-writer numeral-key is struck, its bail is moved downward to depress the adding-machine key-stems in its path.

24. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer, and normally out of alinement with the type-writer keys, and means for moving them into such alinement, a reciprocating bail transversely mounted across the rows of adding-key stems and forming a connection between the type-writer keys and said key-stems, whereby when the corresponding type-writer numeral-key is struck said bail is moved downward to depress the adding-machine key-stems in its path, and means for returning said bail to its normal position.

25. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, and means for moving them into such alinement, and a plurality of reciprocating bails, each transversely mounted across the rods of adding-machine key-stems, and forming a connection between the type-writer keys and said key-stems, whereby, when the corresponding type-writer numeral-key is struck, its bail is moved downward to depress the adding-machine key-stems in its path and means for returning each of said bails to its normal position.

26. The combination with the key-stems of an adding-machine, of the keys of a type-writing machine, mounted over said stems and provided with projecting fingers to actuate the same, each finger consisting of a removable piece rigidly attached to the key-lever and registering with the proper adding-stems.

27. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, and means for moving them into such alinement, a bail placed between each row of adding-machine key-stems having identical numbers with the set of type-writer keys, each type-writer key being provided with a removable, projecting, rigid fender adapted to register with its bail to depress it.

28. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, and means for moving them into such alinement consisting of a plurality of oscillating bars corresponding in position in front with the rows of adding-machine key-stems and in the rear with the teeth of the rack of the type-writer carriage.

29. The combination with the keys of a type-writer, of the key-stems of an adding-machine located beneath the type-writer and normally out of alinement with the type-writer keys, means for moving them into such alinement comprising a plurality of oscillating bars corresponding in position in front with the rows of adding-machine key-stems and in the rear with the teeth of the rack of the type-writer carriage, and means for moving any one of said oscillating bars.

30. The combination with the keys of a type-writer, the key-stems of an adding-machine normally out of alinement with the keys of the type-writer, and means for moving them into such alinement comprising a series of oscillating bars engaging with the adding-machine key-stems, of a plurality of denomination-levers each adapted to place in position a stop adapted in turn to limit the movement of the means by which the proper oscillating bar is actuated to move the row of corresponding adding-machine key-stems into alinement.

31. The combination with a type-writer comprising keys and a carriage, and an adding-machine comprising key-stems normally out of alinement with the type-writer keys, of means for locking the type-writer keys and carriage against further movement, comprising a universal frame adapted to be held against the type-writer key-levers and a movable catch brought to engage with the universal frame by the movement of the type-writer carriage through intermediate mechanism.

32. The combination with a type-writer comprising keys and a carriage, and an adding-machine, of means for locking the type-writer keys and carriage against further movement, comprising a universal frame adapted to be held against the type-writer key-levers; and a movable catch brought to engage with the universal frame by the movement of the type-writer carriage through intermediate mechanism, consisting of an intermediate lever adapted to be moved by the type-writer carriage, and a carriage connected to and moved by said lever and provided with a tongue which in turn actuates the the movable catch against the universal frame.

33. The combination with a type-writer comprising keys and a carriage, and an adding-machine comprising an operating-bar, of means for locking the type-writer keys and carriage against further movement comprising a universal frame to be held against the type-writer key-levers and a movable catch brought to engage with the universal frame by the movement of the type-writer carriage through intermediate mechanism comprising an intermediate lever and means for releasing the parts comprising a lever actuated by the operating-bar of the adding-machine to disengage the intermediate lever from the type-writer carriage.

34. In combination with a type-writer comprising keys, key-levers and a carriage, means for locking the key-levers against further movement comprising a universal frame and a movable catch brought to bear against the said frame through the movement of the carriage of the type-writer to a predetermined point, to actuate the frame against the key-levers.

35. The combination with a type-writer comprising keys, key-levers and a carriage and an adding-machine, comprising key-stems and an operating-bar, of means for locking the key-levers against further movement comprising a universal frame adapted to be brought into contact with all of said key-levers by a movable catch brought to bear against the said frame through the movement of the type-writer carriage, and means for releasing the said parts brought into action by the motion of the operating-bar in the adding-machine.

36. The combination with a type-writer comprising keys, key-levers and a carriage and an adder located beneath the type-writer and comprising an operating-bar, and the key-stems of which are normally out of alinement with the type-writer keys, and which adder is provided with means for moving any row of said key-stems into such alinement, of means for locking the type-writer keys against further movement by the same means which throw the key-stems of the adder into alinement with the type-writer keys.

37. The combination with a type-writer comprising keys, key-levers and a carriage, and an adder located beneath the type-writer and comprising an operating-bar, and the key-stems of which are normally out of alinement with the type-writer keys, and which adder is provided with means for moving any row of said key-stems into such alinement, of means for locking the type-writer key-levers against further movement, comprising a universal frame adapted to be brought into contact with all of said key-levers by a movable catch brought to bear against the said frame through the movement of the same means which throw the key-stems of the adder into alinement with the type-writer keys.

38. The combination with a type-writer comprising keys, key-levers and a carriage, and an adder located beneath the type-writer and comprising an operating-bar, and the key-stems of which are normally out of alinement with the type-writer keys, and which adder is provided with means for moving any row of said key-stems into such alinement, of means for locking the type-writer key-levers against further movement, comprising a universal frame adapted to be brought into contact with all of said key-levers by a movable catch brought to bear against the said frame through the movement of the same means which throw the key-stems of the adder into alinement with the type-writer keys, and means for releasing the said parts brought into action by the motion of the operating-bar of the adding-machine.

39. In combination with a type-writer comprising keys and key-levers, and an adder comprising key-stems normally out of alinement with the type-writer keys, means, comprising oscillators, for moving them into such alinement, a carriage carrying a finger, a universal frame actuated by each type-writer key-lever adapted to oscillate said key-lever, and means for moving said carriage into a position in which the finger is oscillated to reciprocate a selected oscillator.

40. In combination with a type-writer comprising keys and key-levers, and an adder comprising key-stems normally out of alinement with the type-writer keys, means, comprising oscillators, for moving them into such alinement, a carriage carrying a finger adapted to be oscillated by the motion of every type-writer key-lever through intermediate mechanism, and means for adjusting said carriage into a position in which the finger is brought opposite the proper oscillator to reciprocate it.

41. In combination with a type-writer comprising keys and key-levers, and an adder comprising key-stems normally out of alinement with the type-writer keys, and means, comprising oscillators, for moving them into such alinement, a carriage carrying a finger adapted to be oscillated by the motion of every type-writer key-lever through intermediate mechanism, and means for adjusting said carriage into a position in which the finger is brought opposite the proper oscillator to reciprocate it, comprising a stop actuated by a denomination-lever at the front of the type-writer.

42. In a machine of the class described, comprising a carriage and a series of adding-key-stem oscillators, the combination therewith, of means for actuating said oscillators comprising a moving finger, and means for bringing said finger opposite any selected oscillator comprising a stop, and one of a series of denomination-levers for moving said stop to position.

43. In a machine of the class described, comprising a carriage and a series of adding-key-stem oscillators, the combination therewith, of means for actuating said oscillators comprising a moving finger, provided with a tip adapted to contact with said oscillators, and means for bringing said finger opposite any selected oscillator comprising a stop, and one of a series of denomination-levers for moving said stop to position.

44. In a machine of the class described, comprising a carriage and a series of adding-key-stem oscillators, the combination therewith, of means for actuating said oscillators comprising a moving finger, provided with a tip adapted to yield laterally to a limited extent to bring its longitudinal movement into unison with other moving parts of the machine, and means for bringing said finger opposite any selected oscillator comprising a stop, and one of a series of denomination-levers for moving said stop to position.

45. In mechanism of the class described, comprising a type-writer, its carriage, keys and key-levers, and an adder having key-stems normally out of alinement with the type-writer keys, means for locating an adding zone on the paper of the type-writer carriage comprising a leader adjustably secured to said carriage and adapted to contact with and operate the mechanism whereby the adding-machine key-stems are thrown into alinement with the keys of the type-writer.

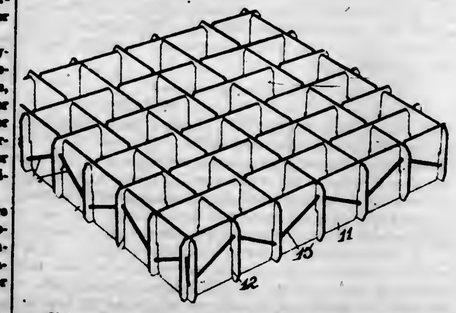
46. In mechanism of the class described, comprising a type-writer, its carriage, keys and key-levers, and an adder having key-stems normally out of alinement with the type-writer keys, means for locating the adding zone on the paper of the type-writer carriage, comprising a leader adjustably secured to said carriage, a finger adapted to move any one of a plurality of oscillators into position to bring a row of adding-key stems into alinement with the type-writer keys, a carriage on which said finger is mounted and a connection between the type-writer-carriage leader and the finger-carriage whereby the latter is moved in unison with the former commencing at a point fixed by the position of the leader on the type-writer carriage.

47. In a machine, of the class described, the combination of a series of pivoted key-stem oscillators, means for actuating said oscillators comprising a finger, and a carriage carrying said finger, and means for checking and governing the movement of the finger-carriage laterally of the machine comprising a fluid-cylinder and a piston adapted to reciprocate in said cylinder and connected to said finger-carriage.

48. In a machine of the class described comprising a finger-carriage, the combination of said finger-carriage, a connection adapted to communicate the step-motion of the type-writer carriage, thereto, comprising a lever adapted to engage therewith and with the type-writer carriage, the operating-bar of the calculating-machine, and means for disengaging the connection of the finger-carriage with the type-writer carriage brought into operation by the depression of the operating-bar of the adding-machine.

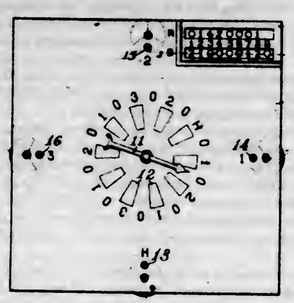
49. In a machine of the class described, the combination of a type-writer carriage, a finger-carriage, a connection adapted to engage with both carriages and communicate the step-by-step movement of the one to the other, and means for disengaging the connection with the type-writer carriage comprising the operating-bar of the adding-machine, the depression of which brings said disengaging means into operation.

811,158. **EGG-CARRIER.** JOSHUA O. MADDUX, Bakersfield, Cal., assignor of one-half to Francis G. Munzer, Bakersfield, Cal. Filed Mar. 11, 1905. Serial No. 249,663.



Claim.—An egg-carrier comprising interlocking partitions having inwardly-extending slots arranged alternately on opposite edges, and having projecting ends, and a binding-cord passing through the projecting ends in a zigzag direction, engaging each end at a point on the side of the center opposed to the slot.

811,159. BASE-BALL-GAME APPARATUS. JAMES P. MAGENIS, Boston, Mass. Filed Oct. 5, 1905. Serial No. 281,443.



Claim.—1. An amusement device consisting of a card having thereon a chance-indicator and having apertures therethrough and at each aperture a party-colored object for presenting different colors through the aperture in accordance with the manifestations of the indicator.

2. An amusement device consisting of a card having at its center a pointer and a row of characters to be indicated thereby and having apertures about its periphery and at each aperture a party-colored card for presenting different colors through the aperture in accordance with the characters indicated by the pointer.

3. An amusement device consisting of a card having at its center a pointer and a row of characters to be indicated thereby and having apertures about its periphery and at each aperture a party-colored card for presenting different colors through the aperture in accordance with the characters indicated by the pointer and having a score-pocket for receiving the tally-sheet.

4. An amusement device consisting of a card having at its center a pivoted pointer and a circle of characters to be indicated thereby, said characters representing acts in the game of base-ball, and having apertures representing the bases in each game, and a party-colored disk rotatably mounted at each aperture to show one of its colors at a time therethrough.

5. An amusement device representing a game of base-ball, consisting of a card having thereon a chance-indicator representing acts in said game, and having recorders at the base locations movable in response to the indication of said indicator and having a pocket for a tally-sheet in whose front wall are apertures through which to mark the score on the tally-sheet.

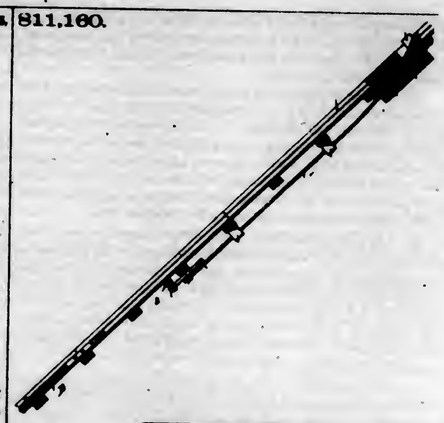
6. A base-ball-game apparatus consisting of a square card having apertures at its sides representing the locations of the bases and having a circle of characters at its center representing different events in a game of base-ball, a pivoted pointer at the center of said circle, tricolored disks pivoted to the under side of the card, one at each of said apertures, whereby one color thereof at a time may be made to appear through the aperture, and a piece of cardboard secured by its inner edges to said card at one corner thereof and having parallel openings therein and bearing the score indications and spaced from the card sufficiently to permit a tally-sheet to be inserted between it and the card so that the score may be marked thereon through said openings.

811,160. RAILWAY-SWITCH. CHARLES A. MANN, Albany, N. Y. Filed May 16, 1905. Serial No. 260,665.

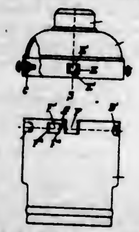
Claim.—1. The combination with a switch-operating lever and rods pivoted thereto at one of their ends and having their opposite ends free and upwardly disposed, of a box having gradually-inclined grooves therein in conformation with the slant of the free ends of said rods constituting slideways therefor, substantially as described.

2. The combination with a switch-operating disk, an arm eccentrically pivoted thereto connecting same with a switch, lever-rods eccentrically pivoted at one end to diametrically opposite sides of said disk, the opposite ends of said rods being upwardly bent and bearing thereon at their extremities contact-blocks of lesser width than the rods, of a box having gradually-inclined grooves in conformation to the bend in the end of the lever-rods and being slightly enlarged adjacent to the throw thereof adapted to retain the rods therein and constitute bearings therefor, substantially as described.

811,160.



811,161. INCANDESCENT-LAMP SOCKET. NORMAN MARSHALL, Newton, Mass. Filed Mar. 31, 1904. Serial No. 200,574.



Claim.—1. A casing for incandescent-lamp sockets, consisting of telescoping shell and cap of sheet metal, one or more radially-extending integral cylindrical lugs on one part internally screw-threaded to receive body-holding screws, and a slot or slots in the other part coöperating with said lug or lugs to hold the parts of the casing together.

2. A casing for incandescent-lamp sockets, consisting of telescoping shell and cap of sheet metal, one or more radially-extending integral cylindrical lugs on one part internally screw-threaded to receive body-holding screws, one or more coöperating slots in the other part in combination with a locking device consisting of a projection formed on one part and springing into a corresponding hole or slot in the other part.

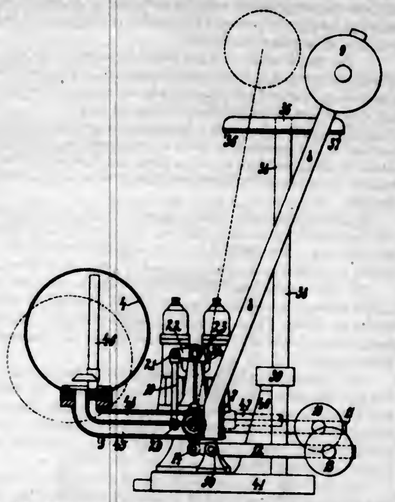
811,162. APPARATUS FOR DISCHARGING CONDENSED STEAM. DUMME MOHET, Chemnitz, Germany. Filed May 25, 1904. Serial No. 209,761.

Claim.—1. In an apparatus for discharging condensed steam and returning same to the boiler the combination of a vessel adapted to rock and provided with a balance-weight, said vessel having a hollow axle communicating with a supply-pipe and a discharge-pipe for the condensed steam, of a fixed casing containing a supply-port and an exhaust-port for steam communicating with said vessel, of a pivoted lever with said vessel connected to said lever and means for balancing the load on the rocking axle, comprising a pivoted lever 12 provided with a weight 13 and a roller 14, said lever 12 adapted to bear on an arm 3 of said axle by said roller, substantially as and for the purpose set forth.

2. An apparatus of the class described comprising a hollow rocking axle, a receiving vessel carried by and communicating with said axle, a balance for said vessel having a variable momentum, a supply and discharge for condensed steam delivering to one end of said axle, a valved steam supply and discharge connected with the opposite end of said axle, and means connecting said valves with said axle for operating said valves approximately at the completion of movement of the axle, substantially as described.

3. An apparatus of the class described comprising a hollow rocking axle, a receiving vessel carried by and communicating with said axle, a balance for said vessel having an increasing and decreasing momentum, a supply and discharge for condensed steam delivering to one end of said axle, a valved steam supply and discharge connected with the opposite end of said axle, and means connecting said valve with said axle for operating said valves approximately at the completion of movement of the axle, substantially as described.

4. An apparatus of the class described comprising a hollow rocking axle, a receiving vessel carried by and communicating with said axle, a counterbalance for said vessel, a supply and discharge for condensed steam delivering to one end of said axle, a valved steam supply and discharge connected with the opposite end of said axle, and means connecting said valve with said axle for operating said valves approximately at the completion of movement of the axle, and antifriction balancing mechanism for said axle, vessel and its counterbalance.



5. An apparatus of the class described comprising a hollow rocking axle, a receiving vessel carried by and communicating with said axle, a balance for said vessel having an increasing and decreasing momentum, a supply and discharge for condensed steam delivering to one end of said axle, a valved steam supply and discharge connected with the opposite end of said axle, and means operatively connecting said valve with said axle for operating said valves approximately at the completion of movement of the axle, and balancing mechanism for said axle, vessel and its counterbalance.

6. An apparatus of the class described comprising a rocking member, a receiver supported by and communicating therewith, a condensed-steam supply and discharge and a valved steam supply and discharge communicating with said member, means operatively connecting said valves and member serving to operate said valves approximately at the completion of movement of said member, and a counterbalance for said receiver having an increasing and decreasing momentum, substantially as described.

7. An apparatus of the class described comprising a rocking member, a receiver supported by and communicating therewith, a condensed-steam supply and discharge and a valved steam supply and discharge communicating with said member, means for operatively connecting said valves and member serving to operate said valves approximately at the completion of movement of said member, and antifriction balancing mechanism for said axle, vessel and its counterbalance.

8. An apparatus of the class described comprising a rocking member, a receiver supported by and communicating therewith, a condensed-steam supply and discharge and a valved steam supply and discharge communicating with said member, means operatively connecting said valves and member serving to operate said valves approximately at the completion of movement of said member, a counterbalance for said receiver having an increasing and decreasing momentum, and balancing mechanism for said axle, vessel and its counterbalance.

9. An apparatus of the class described comprising a rocking axle provided with non-communicating condensed-steam and steam passages, a receiver mounted on said axle and having separate condensed-steam and steam ducts communicating with said passages, the steam-duct extending into the receiver, a valve-box communicating with said steam-passage and provided with steam inlet and outlet valves, springs normally seating said valves, a rocking lever operatively connected with said axle and serving to alternately unseat said valves, a counterbalance for said vessel having an increasing and decreasing momentum, stops limiting movement of said counterbalance, an axle-counterbalance, and a third counterbalance acting upon said axle, said receiver, and the counterbalances thereof.

10. An apparatus of the class described comprising a rocking axle provided with non-communicating condensed-steam and steam passages, a receiver mounted on said axle and having condensed-steam and steam ducts communicating with said passages, a valve-box communicating with said steam-passage and provided with steam inlet and outlet valves, springs normally seating said valves, a rocking lever operatively connected with said axle and serving to alternately unseat said valves, a counterbalance for said vessel having an increasing and decreasing momentum, stops limiting movement of said counterbalance, and an axle-counterbalance.

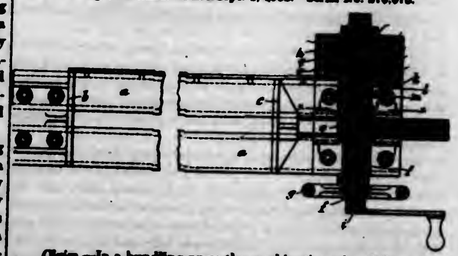
11. An apparatus of the class described comprising a rocking axle provided with non-communicating condensed-steam and steam passages, a receiver mounted on said axle and having condensed-steam and steam ducts communicating with said passages, a valve-box communicating with said steam-passage and provided with steam inlet and outlet valves, springs normally seating said valves, a rocking lever operatively connected with said axle and serving to alternately unseat said valves, an axle-counterbalance, and a counterbalance acting upon said axle, said receiver, and the counterbalances thereof.

12. An apparatus of the class described comprising a rocking axle provided with non-communicating condensed-steam and steam passages, a receiver mounted on said axle and having condensed-steam and steam ducts communicating with said passages, a valve-box communicating with said steam-passage and provided with steam inlet and outlet valves, springs normally seating said valves, a rocking lever operatively connected with said axle and serving to alternately unseat said valves, said lever having a limited play thereby serving to unseat the valves at the completion of movement of said axle, an axle-counterbalance, and a third counterbalance acting upon said axle, said receiver, and the counterbalances thereof.

811,163. EXPANSION CRAMP DEVICE. FRÉDÉRIC DE MORSIER, Geneva, Switzerland. Filed Mar. 8, 1905. Serial No. 249,107.

Claim.—An expansion device comprising at least a pair of legs of sheet metal extending in the same general direction joined at their butt-ends and bent toward each other so as to be closer together at their free ends than at their butt, a nut in the butt-end, so fitting therein as to be embraced by the legs to prevent its rotation and a screw passing through the nut.

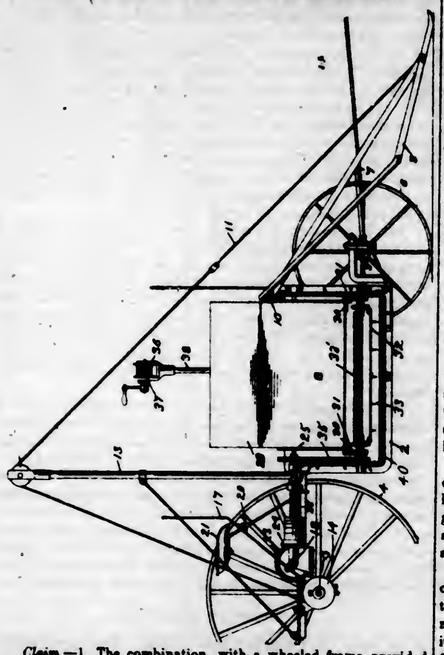
811,164. GEARING FOR BUNDLING-PRESSES. JOHN MURRAY, Edinburgh, Scotland. Filed Sept. 1, 1905. Serial No. 276,675.



Claim.—In a bundling-press the combination of a sliding abutment, a rack fast thereto, a tubular shaft, a pinion fast thereon engaging with the rack, means for directly driving the tubular shaft and pinion, a shaft within the tubular shaft, means for separately driving the same, a train of gearing between the two shafts and means for fixing one of the gears of the train of gearing so that the tubular shaft and pinion are driven by the rotation of the shaft within

when required substantially as described and for the purpose set forth.

811,165. SHOCK-LOADER. SORREN M. NELSON and NIELS NELSEN, Marietta, Minn. Filed Apr. 27, 1905. Serial No. 257,570.



Claim.—1. The combination, with a wheeled frame provided with a hopper, of a fork pivotally supported on said frame and having teeth or tines adapted to rest and slide upon the ground and pick up the shocks of grain or corn thereon, and mechanism within control of the operator for lifting said pivoted fork to discharge the shock gathered up thereby into said hopper.

2. The combination, with a wheeled frame provided with a hopper or receptacle, of a fork pivoted on said frame near said hopper and having teeth or tines adapted to rest and slide upon the ground and pick up the bundles or shocks of grain or corn thereon, mechanism within control of the operator for lifting said fork to discharge the shock into said hopper, and a carrier arranged to gather up the bundles in said hopper and deliver them at the side of the machine, substantially as described.

3. The combination, with a wheeled frame provided with a hopper, of a pivoted fork adapted to rest and slide upon the ground, an inclined plate arranged in said hopper and whereon the bundles of grain are discharged from said fork, mechanism for tilting said fork, and a carrier arranged to receive the bundles from said plate.

4. The combination, with a wheeled frame having a shock-receptacle, of a fork pivoted on said frame and having teeth to rest and slide upon the ground, a hinged plate arranged in said hopper, means for imparting a jarring or jolting movement to said plate, and a transversely-operating carrier arranged to receive the bundles from said plate, substantially as described.

5. The combination, with a wheeled frame having a hopper near its forward end, of a fork pivotally supported on the forward wall of said hopper and having teeth that rest and slide upon the ground, mechanism for raising said fork to allow the shocks gathered up thereby to be discharged into said hopper, an inclined plate provided in said hopper and whereon the bundles fall from said fork, means for imparting a jarring or jolting action to said plate, and a carrier pivotally supported at its lower end in said hopper and arranged to receive the bundles from said plate and deliver them at the side of the machine.

6. The combination, with a wheeled frame provided near its forward end with a transversely-arranged hopper, of a fork pivoted on the forward wall of said hopper and having teeth that rest and slide upon the ground, a drum loosely mounted on the rear axle, a standard mounted on said frame and having a pulley, a cable attached to said drum and passing over said pulley to said fork, and a clutch mechanism within control of the operator for temporarily locking said drum on said axle, and a carrier operating in the bottom of said hopper and arranged to receive the bundles of grain or corn and deliver them at the side of the machine.

7. The combination, with a wheeled frame and a hopper, of a tilting fork arranged in front of said hopper and having teeth adapted to pick up shocks of grain or corn, and mechanism for raising said fork to discharge the gathered shock into said hopper.

8. The combination, with a frame and hopper, of a tilting fork arranged to pick up shocks of grain or corn from the ground, mechanism for tilting said fork to raise a shock and discharge it into said hopper, and a carrier or elevator operating in connection with said hopper.

9. The combination, with a wheeled frame provided with a shock-receptacle, of a fork having teeth adapted to pick up shocks of grain or corn, a vibrating plate provided in said receptacle, and a carrier or elevator operating in connection with said receptacle.

10. The combination, with a wheeled frame provided with a hopper having a removable floor or plate, of a pivoted fork arranged to pick up shocks of grain or corn, means for tilting said fork to discharge its load into said hopper, and a carrier or elevator operating in said hopper.

11. The combination, with a wheeled frame having a drop portion near its forward end and a hopper carried thereby, the bottom of said hopper being below the rear of said frame, a fork hinged near the forward wall of said hopper and having teeth adapted to pick up shocks of grain or corn, a side-delivery elevator operating in said hopper, and means for tilting said fork.

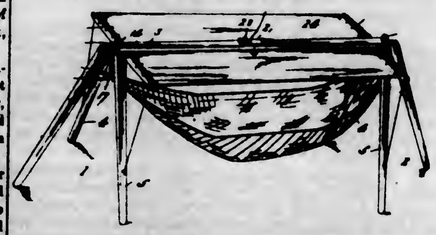
12. The combination, with a frame, of a side-delivery carrier or elevator mounted thereon, a fork pivoted in front of said elevator and having teeth adapted to slide upon the ground and pick up shocks of grain or corn, a vibrating bundle-support provided near said elevator and mechanism for raising said fork to discharge its load upon said support, substantially as described.

13. The combination, with a frame, of a side-delivery elevator or carrier thereon, a fork hinged in front of said elevator and having teeth adapted to pick up shocks of grain or corn, an upright standard mounted on said frame in the rear of said elevator and provided at its upper end with an antifriction-wheel, a cable attached to said fork and passing over said wheel, and mechanism for winding up said cable to raise said fork.

14. The combination, with a wheeled frame and hopper, of a side-delivery carrier or elevator operating therein, a fork hinged near the forward wall of said hopper, mechanism for driving said carrier continuously from the wheel-axle, and mechanism for intermittently raising said fork to discharge its contents.

15. The combination, with a wheeled frame and a shock-receptacle, of a vibrating bundle-support provided in said receptacle, a carrier or elevator operating near said support, and means for delivering shocks of grain or corn to said support, substantially as described.

811,166. HAMMOCK-SUPPORT. GERHART J. NUESSEN, Ardale, Kans. Filed Apr. 3, 1905. Serial No. 253,402.

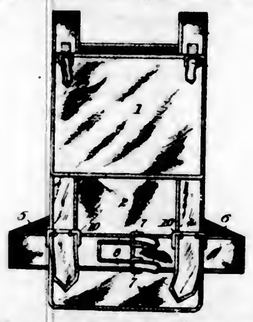


Claim.—1. A hammock-support comprising two tripods, the legs of each being connected at their upper ends by a triple hinge having the pintle of two of the leaves provided with a knuckle having a longitudinal recess therethrough adapted to register with similar recesses in the knuckles of the third leaf, a vertical projection extending upward from the said hinge, a jointed beam supported by the tripod and secured to the said projection and means to retain the beam in its extended position, an eye carried by said pintle and awning-supporting rods supported by said eye.

2. A hammock-support comprising two tripods the legs of each being connected at their upper ends by a triple hinge having the pintle of two of the leaves provided with a knuckle having a longitudinal recess therethrough adapted to register with similar recesses in the knuckles of the third leaf, a ring carried by the said pintle between the two hinged leaves and the knuckle provided thereon, a depending rod secured thereto and means to limit the outward movement of the legs of the tripod secured to the lower portion of said rod.

3. A hammock-support comprising two tripods, the legs of each being hinged together, a rod depending from said hinge provided with means to which the ends of the hammock may be secured and means attached to said depending rod to limit the outward movement of the legs of the tripod.

811,167. PROTECTOR FOR BACKS AND CHESTS. MILAN L. PADDOCK, Lyons, N. Y. Filed Aug. 25, 1905. Serial No. 275,748.



Claim.—The herein-described lung-protector comprising a back pad, waist-line straps attached thereto and having tongue-and-buckle connection with each other in front, shoulder-straps attached to said pad and adapted to pass over the shoulders and down to the waist-straps, buckle connections between said shoulder-straps and the members of the waist-strap, a chest-pad, and independent strap-and-buckle attachments between said chest-pad and the shoulder-straps, all buckles being at the front of the wearer, as and for the purpose set forth.

811,168. DEVICE FOR COUNTERBALANCING TONGUES. JOHN B. PARDEE, Rydal, Kans. Filed May 22, 1905. Serial No. 261,647.

Claim.—1. In a device for counterbalancing tongues the combination of a bar secured to the tongue and extending to the rear of the point where the tongue is pivoted, and a weight adjustably mounted upon the bar so as to counterbalance the weight of the tongue.

2. In a device for counterbalancing tongues, the combination of a bar secured to the tongue and extending to the rear of the point where the tongue is pivoted, a weight slidably mounted upon the bar, a lever fulcrumed upon the bar and adapted to operate the weight, and means for locking the weight in position.

3. In a device for counterbalancing tongues, the combination of a bar secured to the tongue and extending to the rear of the point where the tongue is pivoted, a weight slidably mounted upon the bar, a lever fulcrumed upon the bar and connected with the weight so that same can be adjusted by moving the lever, and a ratchet which engages a pawl on the lever to hold same in a fixed position.

811,169. EDUCATIONAL APPARATUS. FRANCES B. PARRISH, New York, N. Y.; Emma M. Parrish Holmes administratrix of said Frances B. Parrish, deceased. Filed Sept. 6, 1905. Serial No. 277,168.

Claim.—1. An educational apparatus comprising a tablet or support, a series of characters or symbols adapted to be removably placed thereon, and a guide and exercise sheet adapted to be placed over the tablet and detachably secured thereon by the characters.

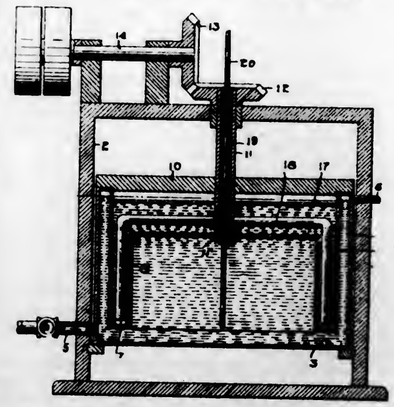
2. An educational apparatus comprising a tablet or support, a series of characters or symbols provided with pins by which they are adapted to be removably secured to the tablet, and a guide-sheet adapted to be placed over the tablet and detachably secured thereon by the characters.

3. An educational apparatus comprising a support, a series of characters or symbols, a pivot-pin connected to each of said characters and by which said character may be detachably and rotatably secured to the support, and an exercise-sheet adapted to be placed over the tablet and detachably secured thereon by the characters.

4. An educational apparatus comprising a main receptacle provided with a plurality of small compartments, a series of instruction characters or symbols adapted to be arranged in said compartments, a pin-like pivot connected to each of said characters, and a soft tablet adapted to fit within said main receptacle and to form a support for the characters, and a cover for said receptacle

5. An educational apparatus comprising a main receptacle provided with a plurality of small compartments, a series of instruction characters or symbols adapted to be arranged in said compartments, a pin-like pivot connected to each of said characters, and a soft tablet adapted to fit within said main receptacle and to form a support for the characters, and a protecting exercise-sheet adapted to cover said tablet and to be detachably secured thereto by the characters, and a cover for said receptacle.

811,170. PASTEURIZER OR COOLER. DARIUS W. PAYNE, Minneapolis, Minn. Filed Feb. 21, 1905. Serial No. 246,867.



Claim.—1. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of the inner wall having a raised central portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a pipe centrally mounted on said raised portion, a revolving sleeve inclosing said pipe and provided with stirring arms operating between the said raised portion and the said inner wall.

2. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of the inner wall having a series of raised portions that are spaced from one another and from the sides of said inner wall, the space inclosed by said inner wall around said raised portions forming a cream-receptacle and having cream inlet and discharge pipes, and a series of stirring-arms operating between said raised portions and in the space between said raised portions and the sides of said inner wall.

3. A tank having an inner and outer wall with a space between them, and water and steam inlet and exhaust pipes communicating

with said space, the bottom of the inner wall having a series of raised portions there being one in the center with the others at regular intervals around it, the space inclosed by said inner wall forming a cream-receptacle and having cream inlet and discharge pipes, stirring-arms depending within the space around said central raised portion, a gear mechanism for driving the same, a series of other stirring-arms depending within the space around said other raised portions and operatively connected with the driving mechanism for said first-named stirring-arms whereby all of them will be operated simultaneously, substantially as described.

4. An apparatus for pasteurizing cream comprising a tank having an inner and outer wall with a space between them, and an exhaust-pipe communicating with said space, the bottom of said inner wall having a raised central portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a pipe rigidly connected concentrically to the said raised central portion, a sleeve surrounding the said pipe provided with a bevel-gear on its upper end and at its lower end having stirring-arms depending within the space between the said raised portion and the sides of the said inner wall, and a driving-shaft arranged above the said tank and provided with a bevel-gear meshing with the bevel-gear on the said sleeve.

5. An apparatus for pasteurizing cream comprising a tank having an inner and outer wall with a space between them, and an exhaust-pipe communicating with said space, the bottom of said inner wall having a raised central portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a revolving sleeve vertically arranged above said raised portion centrally with respect thereto, a series of angled stirring-arms or agitators carried by said sleeve and extending across the top of said raised portion and depending within the space between said raised portion and the sides of said inner wall.

6. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of the inner wall having a series of raised portions that are spaced from one another and from the sides of said inner wall, the space inclosed by said inner wall around said raised portions forming a cream-receptacle and having cream inlet and discharge pipes, a series of pipes connected centrally to the said raised portions, and a series of revolving sleeves surrounding the said pipes and provided with stirring-arms operating in the spaces between the said raised portions and the said inner walls.

7. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of the inner wall having a raised central portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a pipe secured to the top of said central portion and forming a tight joint therewith, and stirring-arms revolving around said pipe in the space between said raised central portion and said inner wall, substantially as described.

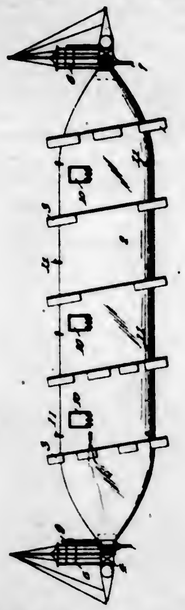
8. A tank having an inner and outer wall with a space between them and inlet and exhaust pipes communicating with said space, the bottom of the inner wall having a raised stationary central portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a vent-pipe leading into the space inclosed by said raised central portion and stirring-arms operating in the space between said raised portion and the sides of said inner wall.

9. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of said inner wall having a raised portion that is spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a steam-pipe communicating with the space inclosed by said raised portion, and stirring-arms operating in the space between said raised portion and the sides of said inner wall.

10. A tank having an inner and outer wall with a space between them, and inlet and exhaust pipes communicating with said space, the bottom of said inner wall having a series of raised portions that are spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, pipes communicating with the space inclosed by said raised portions, and stirring-arms operating in the space between said raised portions and the sides of said inner wall, substantially as described.

11. An apparatus for pasteurizing cream comprising a tank having an inner and outer wall with a space between them, and an exhaust-pipe communicating with said space, the bottom of said inner wall having a raised central portion spaced from the sides of said inner wall, the space inclosed by said inner wall forming a cream-receptacle, a pipe secured centrally to said raised portion, stirring-arms arranged to revolve around said pipe, and a steam-pipe fitting within said first-named pipe and leading into the space inclosed by said raised portion, substantially as described.

811,171. **MARINE BOAT.** SAMUEL PRESBERTON and JOHN F. DRAPMAN, Sault Ste. Marie, Mich. Filed July 14, 1905. Serial No. 270,213.



Claim.—1. A boat of the character described comprising a longitudinal shaft, two concentric hulls, one of which is fast on said shaft and the other of which rotates outside of the fixed hull, the outer hull being provided with a propeller, a pilot-house at each end of the said shaft outside of the said hulls, and a hollow rudder-post secured in the end of the shaft and provided with an opening to admit of water being pumped therethrough for the purpose set forth.

2. A boat of the character described comprising a longitudinal shaft, an inner hull fixed on said shaft, and an outer concentric hull designed to rotate on the shaft and provided with a propeller, hollow tubular bearings 7 secured to the shaft at each end thereof outside of said outer hull, pilot-houses supported at the end of said shaft, and a rudder having a tubular post mounted in the tubular bearings 7 and arranged to admit of water being pumped through the post for the purpose set forth.

811,172. **PAPER-MOVEMENT INDICATOR FOR TYPE-WRITERS.** CHARLES C. POOLE, Evanston, Ill., assignor to Oliver Typewriter Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 20, 1905. Serial No. 246,691.

Claim.—1. The combination with a rotative platen, of two pointers which have angular adjustment relatively to each other, means for locking said pointers to rotate with the platen, and automatic means for restoring the pointers to predetermined positions when released from the platen.

2. The combination with a carriage-frame and a rotative platen, of a pointer on said frame and two pointers which have angular adjustment relatively to each other, means for locking said pointers to rotate with the platen, and automatic means for restoring said pointers to predetermined positions when released from the platen.

3. The combination with the rotative platen, of two pointers which are angularly adjustable relatively to each other, means for locking said pointers to rotate with the platen, and gravity-acting means for restoring the pointers to predetermined positions when released from the platen.

4. The combination with the rotative platen and its shaft, of a part rotative on said platen, two pointers, one of which is fixed to said part and the other of which is angularly adjustable relatively to the first pointer, means for locking said part to rotate with the shaft, and automatic means for restoring said part to a predetermined position when released from the shaft.

5. The combination with the rotative platen and its shaft, of a part rotative on said platen, two pointers, one of which is fixed to said part and the other of which is angularly adjustable relatively to the first pointer, means for locking said part to rotate with the shaft, and gravity-acting means for restoring said part to a predetermined position when released from the shaft.

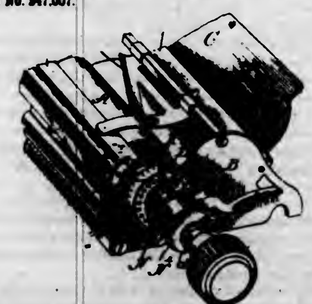
6. The combination with a rotative platen and its shaft, of a disk having rotative engagement with the shaft, two pointers, one of which is fixed to the disk and the other of which is angularly adjustable on the disk, a clutch device for locking said disk to rotate with the platen, and gravity-acting means for restoring the disk to its starting position when released from the shaft.

7. The combination with a rotative platen and its shaft, of a disk rotative on the shaft, two pointers, one fixed to the disk and the other angularly adjustable relatively to the disk, and means for locking said disk to the shaft comprising a sleeve having endwise-movable but non-rotative engagement with the shaft, and coacting clutch elements carried by said sleeve and the disk.

8. The combination with a rotative platen and its shaft, of a disk rotative on the shaft, two pointers, one fixed to the disk and the other angularly adjustable relatively to the disk, means for locking said disk to the shaft comprising a sleeve having endwise-movable but non-rotative engagement with the shaft, and coacting clutch elements carried by said sleeve and the disk, and automatic means for restoring the disk to its starting position when released from the shaft

9. The combination with a rotative platen and its shaft, of a disk rotative on the shaft, two pointers, one fixed to the disk and the other angularly adjustable relatively to the disk, a clutch for locking said disk to the shaft, and means for yieldingly holding said clutch in its clutching position and also for yieldingly holding it in its releasing position.

811,173. **PAPER-MOVEMENT INDICATOR FOR TYPE-WRITERS.** CHARLES C. POOLE, Evanston, Ill., assignor to Oliver Typewriter Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 23, 1905. Serial No. 247,007.



Claim.—1 The combination with a rotative platen, of two pointers which turn with and have angular adjustment relatively to the platen and have also angular adjustment relatively to each other, and means for positively locking said pointers to rotate with the platen.

2. The combination with a carriage-frame and a rotative platen, of a pointer on the frame, and two pointers which turn with and have angular adjustment relatively to the platen, and have also angular adjustment relatively to each other, and means for positively locking said pointers to turn with the platen.

3. The combination with a rotative platen and its shaft, of two pointers rotative on the shaft and adapted for angular adjustment with respect to each other and a positively-operating clutch device for locking said pointers to the shaft to rotate therewith.

4. The combination with a rotative platen and its shaft, of a part rotative on said shaft, two pointers, one fixed to said part, and the other angularly adjustable thereon, and a positively-operating clutch device for locking said part to the shaft.

5. The combination with a rotative platen and its shaft, of a part rotative on said shaft, two pointers, one fixed to said part and the other angularly adjustable thereon, and a positively-operating spring-pressed clutch for locking said part to the shaft.

6. The combination with a rotative platen and its shaft, of a disk rotative on said shaft, two pointers, one of which is fixed to the disk and the other of which has angular adjustment on the disk, an endwise-sliding sleeve on said shaft having interlocking but non-rotative connection with said disk, and a clutch member on said sleeve adapted to engage a complemental clutch member on the shaft.

7. The combination with a rotative platen and its shaft, of a disk rotative on said shaft, two pointers, one of which is fixed to the disk and the other of which has angular adjustment on the disk, an endwise-sliding sleeve on said shaft having interlocking but non-rotative connection with said disk, and a clutch member on said sleeve adapted to engage a complemental clutch member on the shaft, said sleeve being provided with a flange affording a finger-hold by which the sleeve may be operated.

8. The combination with a rotative platen and its shaft, of a disk rotative on said shaft and provided with circumferential scale marks or graduations, a pointer carried by and having angular adjustment on said disk and a positively-operating clutch device for locking said disk to the shaft.

9. The combination with a rotative platen and its shaft, of a disk rotatively mounted on said shaft and provided with a hub, a part rotative on said hub and carrying a pointer, said pointer being otative with respect to the disk, means for locking said pointer to the disk, and a positively-operated clutch device for locking the disk to said shaft.

10. The combination with a rotative platen and its shaft, of a disk rotatively mounted on said shaft and provided with a hub, a part rotative on said hub and carrying a pointer, said pointer being rotative with respect to the disk, means for locking said pointer to the disk, and a clutch device for locking the disk to said shaft, embracing an endwise-sliding sleeve on the shaft having endwise-movable but non-rotative connection with said hub, said sleeve being provided with one of the members of a clutch adapted to engage a complemental clutch member on the shaft.

11. The combination with a rotative platen and its shaft, of a disk rotative on said shaft and provided with a hub, two pointers one fixed to said disk and the other having angular adjustment relatively thereto, and a clutch for locking said disk to the shaft comprising a sleeve having bearing on the shaft and surrounding and having endwise-movable but non-rotative connection with the hub of said disk, said sleeve being provided at one end with clutch-teeth adapted to engage clutch-teeth carried by a part rotating with the shaft, and a spring interposed between said hub and a shoulder in said sleeve for holding said clutch-teeth in engagement.

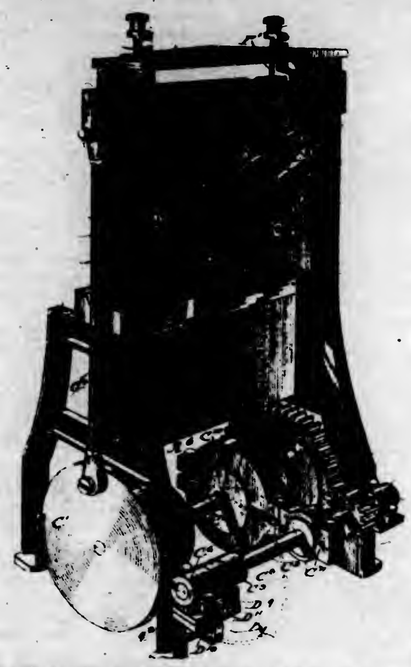
811,174. **BEVELING-MACHINE.** LOWELL H. RICE, Chicago, Ill., assignor to Metal Sectional Furniture Company, a Corporation of Maine. Filed Feb. 16, 1903. Serial No. 143,836.

Claim.—1. A feed-table for a beveling-machine consisting of a table supported by a block superposed upon another block and which blocks are adjustably fitted to each other by respective convex and concave surfaces, and means for actuating said blocks.

2. In a machine for beveling millboards and the like, the combination with, a feed-table, a back guide, a clamp and means for actuating said clamp, of means for cutting one or more millboards comprising a horizontal straight-edge, and a knife set at an angle with said straight-edge, and coacting with the same and movable in a perpendicular plane, and means for lowering and raising said knife.

3. In a machine for beveling millboards and the like, the combination with a horizontal straight-edge or ledger-blade, and a corresponding knife set on an angle to said ledger-blade, and movable in a perpendicular plane, and means for actuating said movable knife, of

a feed-table comprising a flat table supported by a block superposed upon another block and which blocks are adjustably fitted to each other by respective convex and concave surfaces, and means for actuating said adjustable blocks.



4. In a machine for beveling millboards and the like, the combination with cutting-knives, and means for operating the same of a feed-table supported by a block superposed upon another block, and which block in turn rests upon the frame of the machine; the said blocks being adjustably fitted to each other by a respective convex and concave surface, which forms the segment of a circle of which the edge of the feed-table lying nearest to the cutting-plane is the center, and means for securing said blocks together.

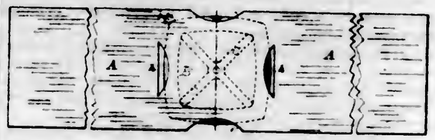
5. In a machine for beveling millboards and the like, the combination with cutting-blades, one stationary and the other movable in a perpendicular plane, a feed-table and means for actuating said blades, of an adjustable back guide, consisting of two parallel plates, one of which is secured to the frame of the said movable knife, and the other adjustably attached to the said secured plate and extending toward the cutting-plane from that side of the cutting-plane opposite to the feed-table, and means for actuating said adjustable guide.

6. In a machine for beveling millboards and the like, the combination with cutting-knives, an adjustable feed-table, and means for operating said knives and means for actuating said feed-table, of a back guide consisting of two plates lying opposite to said feed-table and on the opposite side of the cutting-plane of said knives, one of said plates being secured to the frame of one of the said knives and the other lying between said secured plate and the cutting-plane of said knives and being adjustably secured to said secured plate, and means for advancing said adjustable plate toward and retiring it from said cutting-plane.

7. In a beveling-machine, a feed-table consisting of a table secured at its rear end to a block fitted with a convex surface, the forward end of said table being free; a block secured to the frame of said machine and fitted with a concave surface, said convex and concave surfaces having adjustable engagement with each other.

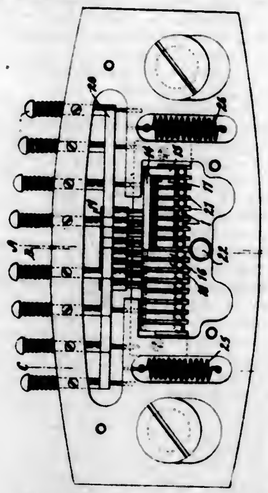
8. In a beveling-machine, a feed-table consisting of a table having its forward end free from securement, and being secured at its rear end to a block superposed upon another block, which latter block is attached to the frame of said machine, and which blocks are fitted respectively with convex and concave surfaces at the point of contact with each other, and means for adjusting said blocks in their relation with each other, and with the frame of the said machine

811,175. LEVEL. JOHN T. REESE, Oil City, Pa. Filed Nov. 10 1904. Serial No. 232,282.



Claim.—The plumb and level herein described, consisting of the stock, provided with a cavity, containing the rectangular or square tube B, which contains a solid body of fluid, and the indicating-bubble, that can freely circulate therein, in combination with the brace C and set-screw *f*, all arranged as shown and specified.

811,176. PIANO MACHINE-HEAD FOR PUNCHING JACQUARD-CARDS. VERNON R. ROYLE, Paterson, N. J. Filed Jan. 13 1904. Serial No. 188,901.



Claim.—1. The combination with the punches and slides for locking and releasing the punches, of tie-bars rigidly connecting a plurality of slides, operating-keys and links of different lengths for connecting the keys with the tie-bars.

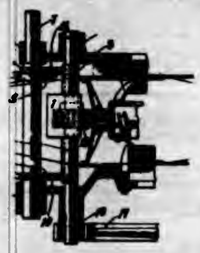
2. The combination with the punches and slides arranged to lock and release the punches, of tie-bars connecting non-adjacent slides to move in unison, operating-keys and links of different lengths for connecting the operating-keys with the tie-bars for placing the slides under the control of the keys.

3. The combination with the punches and slides for locking and releasing the punches, certain of the slides being provided with recesses in their lower ends and resting normally in locking position while other slides rest normally out of locking position, of tie-bars each arranged to connect one of the slides which is normally out of locking position with a slide normally in locking position, operating-keys and links of varying lengths for connecting the operating-keys with the tie-bars to simultaneously move the slides in the same direction one into and another out of locking position.

4. The combination with the punches and the slides arranged to lock and release the punches, of tie-bars each connecting a plurality of slides, operating-keys and links of varying lengths for connecting the keys with the tie-bars whatever may be the position of the keys with respect to the tie-bars.

5. The combination with the body of the head, the punches, slides for locking and releasing the punches and a slide-supporting plate or bolster separate from the head and located therein and provided with guide-flanges for directing the movements of the slides, of tie-bars connecting the slides in groups and extending along recesses formed in intermediate slides and means for operating the tie-bars and hence the slides.

811,177. PINION-GUARD FOR CIRCULAR LOOMS. VERNON ROYLE, Paterson, N. J. Filed June 17, 1904. Serial No. 212,926.



Claim.—1. The combination with a shuttle-driving pinion of a circular loom and its upright shaft, of an upright support spaced from the spindle and a pinion-guard mounted on the said upright support and comprising hollow sections adapted to swing toward and away from each other into and out of position in proximity to the said driving-pinion.

2. A pinion-guard comprising hollow sections provided with laterally-extending arms for hinging the sections to a support and means for locking the sections in closed adjustment under the influence of gravity.

3. A pinion-guard comprising hollow sections provided with laterally-extending arms for hinging them to a support and a notched arm for receiving the arms on the sections to hold the sections in closed adjustment.

4. The combination with an upright support, an upright shaft spaced from the upright support and a pinion on the shaft, of a pinion-guard comprising hollow body portions for housing the pinion and laterally-extending arms provided with rings for embracing the upright support and a collar adjustably secured to the upright support for holding the guard-sections against a downwardly-sliding movement of the upright support, the said collar being provided with a notched arm projecting therefrom for locking the guard-sections in closed adjustment under the influence of gravity.

811,178. LADY'S AUTOMOBILE-HAT. HORACE A. SAKS, New York, N. Y., assignor to Saks & Company, New York, N. Y., a Corporation of New York. Filed Sept. 12, 1905. Serial No. 278,093.

Claim.—1. An automobile-hat comprising a crown, a brim arranged to swing down at an angle thereto, and a shield attached to the crown and brim for closing the space between the crown and brim when the brim is lowered.

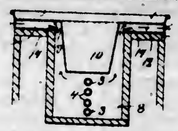
2. An automobile-hat comprising a crown, a brim arranged to swing down at an angle thereto, and a shield attached to the crown and brim for closing the space between the crown and brim when the brim is lowered, the said shield being arranged to fold between the crown and brim when the brim is raised.

3. An automobile-hat comprising a crown, a brim arranged to swing down at an angle thereto, and a shield attached to the crown and brim for closing the space between the crown and brim when the brim is lowered, and means for removably holding the brim in its raised position.

4. An automobile-hat comprising a crown, a brim arranged to swing down at an angle thereto, a shield attached to the crown and brim for closing the space between the crown and brim when the brim is lowered, said shield being arranged to fold between the crown and brim when the brim is raised, and means for removably holding the brim in its raised position.

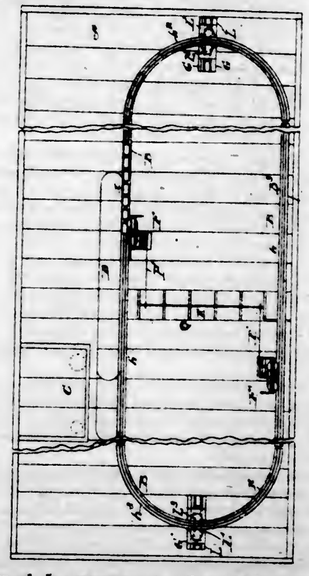
5. An automobile-hat comprising a crown, a brim hinged to the front of the crown and a loose shield attached to the brim and crown.

811,179. CONFECTIONER'S WORK-TABLE. LORENZ SCHMIDT, Milwaukee, Wis. Filed Feb. 2, 1905. Serial No. 243,896.



Claim.—A work-table provided with a working-slab and a heating-space therebelow, said slab being formed with an opening, in combination with a chocolate-pan provided with extensions formed with damper-controlled air-flues, said pan adapted to depend through said opening into said space, and means for heating the air in said space.

811,180. CONVEYER. ARCHIBALD W. F. STRUKEL, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Jan. 6, 1903. Serial No. 138,043.



Claim.—1. In a conveyer system, the combination of an endless series of conveyer elements connected together and arranged to travel continuously in a horizontal plane, the guiding devices for changing the direction of travel of elements at either end of the system, and the two-part driving mechanism, each part comprising an endless series of elements arranged to travel continuously in horizontal planes and to engage with and travel parallel to the inner sides of said conveyer elements while advancing them, one part of said driving mechanism being arranged to engage with the conveyer on one side of its course, and the other part being arranged to engage with the conveyer on the opposite side of its course, substantially as set forth.

2. In a conveyer apparatus the combination of the endless series of conveyer elements, the guiding devices therefor arranged to provide two rectilinear sections of the path or circuit for the conveyer, and two curved sections, two sets of driving devices, one engaging with one of the rectilinear sections of the conveyer and the other engaging with the other rectilinear section, independently of the curved or turning sections thereof, substantially as set forth.

3. In a conveyor system the combination of the endless series of conveyor elements arranged to travel continuously in horizontal planes, the guiding devices therefor arranged to provide rectilinear sections at the sides of the path-circuit for the conveyor and two curved sections at the ends of the said circuit, and a driver for the conveyor having conveyor-engaging devices which travel continuously in horizontal planes and rectilinearly in parallelism with the rectilinear sections of the conveyor for a portion of their length, substantially as set forth.

4. In a conveyor apparatus the combination of the endless series of conveyor elements, the guiding devices therefor arranged to provide two curvilinear end sections of the path or circuit for the conveyor system, means for adjusting one of the curved sections of the guide toward and from the other curved section, and a driver for the conveyor arranged to engage with that section of the conveyer which is between the two curved end sections, substantially as set forth.

5. In a conveyor apparatus the combination of the endless series of conveyer elements, the guide therefor arranged to provide two curved end sections for the path or circuit of the conveyer, and a rectilinear section between them, a driving device for the conveyer which engages therewith at the said intermediate section, and means for adjusting bodily one or both of the curved end sections of the guide independently of the driving device, substantially as set forth.

6. In a conveyor of the character described the combination with an endless series of flexibly-connected cars or conveyer elements, of unflanged supporting-wheels upon which said cars or elements rest, said wheels being peripherally flared or tapered where they rest upon guide-rails, substantially as set forth.

7. In a conveyer of the class described, the combination with the cars or conveyer elements and the vertically-rotating supporting-wheels at the bottoms of the cars or conveyer elements, of the chain-links secured to said cars at one side thereof and above the horizontal planes of the axles of said supporting-wheels, each of said links carrying a series of draft-receiving elements the links flexibly connecting the adjacent ends of adjoining cars or conveyer elements together, and the driving-chain having laterally-projecting lugs adapted to engage with the links on said cars or conveyer elements, substantially as set forth.

8. In a conveyer of the class described the combination with an endless series of cars or conveyer elements and the rectilinearly-moving driver, of the means flexibly connecting each car or conveyer to the next, and a series of driving devices arranged longitudinally on each car or element and held permanently in a straight line, and rigidly relative to the said car or element, substantially as set forth.

9. In a conveyer of the class described the combination with the endless series of cars or conveyer elements flexibly connected together and the driving-chain having driving devices which move in straight lines while in action, of the series of driving devices carried by the car arranged longitudinally thereon and held thereon in a straight line, rigidly relative to said car or element, substantially as set forth.

10. The combination with the cars or conveyer elements and the driving mechanism having drivers which travel in substantially straight lines while in action, of the longitudinally-arranged series of pins or lugs j^3 secured to each car and held rigidly in line thereon, substantially as set forth.

11. In a conveyer of the class described the combination with the cars or conveyer elements flexibly connected together in endless series, of the driving devices moving in horizontal planes, relatively near the tops of the cars or conveyer elements, the vertically-rotating supporting-wheels at the bottoms of the cars or conveyer elements and the horizontally-rotating wheels arranged in horizontal planes relatively near the planes of power application, substantially as set forth.

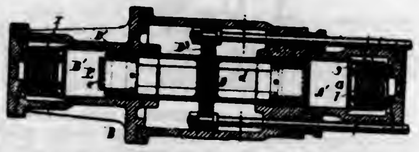
12. In a guideway for the elements of a conveyer system, the combination of the rectilinear side sections, and the curvilinear end sections formed independently of said side sections and bodily adjustable relatively to said side sections, substantially as set forth.

13. In a conveyer system, the combination of the fixed sections of trackway arranged at either side of the path-circuit of the system, the curvilinear end sections and means for bodily adjusting said end sections relative to said fixed sections, substantially as set forth.

14. In a conveyer system, the combination of the fixed sections of trackway arranged at either side of the path-circuit of the system, the curvilinear end sections completing the path-circuit from one of said sides to the other, and means for adjusting the said end sections relative to the said fixed sections comprising the bed-plate L, the sliding plate L' mounted thereon and the sleeper L^2 pivotally mounted on said sliding plate, the said curved trunk-sections being pivotally secured to the said sleeper, substantially as set forth.

15. In a trackway for a conveyer system, the combination of the fixed sections forming the sides of the path-circuit of the conveyer, the curvilinear section arranged to connect the said fixed sections and means for adjusting the said curvilinear section bodily relative to said fixed sections, the curvilinear section being mounted upon said adjusting means so as to be free to swing bodily about a vertical axis, substantially as set forth.

811,181. GAS-COMPRESSOR. LOUIS STERNE, London, England. Filed Aug. 18, 1904. Serial No. 221,279.



Claim.—1. A double-acting gas-compressor, composed of two tandem single-acting single-stage compressor-cylinders, each having a delivery-valve at its outer end, a gas-tight casing of larger diameter connecting the adjacent inner ends of the cylinders, a return-gas inlet to the casing, two connected hollow trunk-pistons working in the respective cylinders, each such piston carrying a suction-valve and apertured to afford communication between the casing and the valve, radial arms on the pistons, and piston-rods connected to the arms and passing through lateral stuffing-boxes at one end of the casing, whereby the cylinders, pistons and piston-rods are kept at a moderate uniform low temperature.

2. A double-acting gas-compressor, composed of a gas-tight casing provided with a return-gas inlet, compressor-cylinders closed at their outer ends only and there provided with delivery-valves and arranged in line with each other at opposite ends of said casing with their respective open ends turned toward the center of said casing, pistons provided with suction-valves and united to each other by an interposed connection in said casing, each of said pistons working in the corresponding compression-cylinder and each admitting the gas through its interior directly into such cylinder from said casing, and piston-rods connected inside said casing with said pistons and reciprocating endwise in stuffing-boxes on said casing, substantially as described.

3. A double-acting gas-compressor, composed of a gas-tight casing provided with a return-gas inlet, compressor-cylinders closed at their outer ends only and there provided with delivery-valves and arranged in line with each other at opposite ends of said casing with their respective open ends turned toward the center of said casing, hollow trunk-pistons provided with suction-valves and united to each other by an interposed integrally-formed open-sided hollow connection in said casing, each of said pistons working in the corresponding compression-cylinder and each admitting the gas through its interior directly into such cylinder from said casing, and the walls of said hollow connection being in line with the walls of said hollow trunk-pistons, and piston-rods connected inside said casing with said pistons and reciprocating endwise in stuffing-boxes on said casing, substantially as described.

811,182. TYPE-WRITING MACHINE. BURNHAM C. STOCKNEY, Elizabeth, N. J., assignor to Underwood Typewriter Company, New York, N. Y., a Corporation of New Jersey. Filed Dec. 16, 1903. Serial No. 185,261.

Claim.—1. In a type-writing machine, the combination with a type-bar of a movable inelastic metallic member forming a rest therefor.

2. In a type-writing machine, the combination with a type-bar of a movable lead rest therefor.

3. In a type-writing machine, the combination with a series of type-bars of a movable ring of lead forming a rest therefor.

4. In a type-writing machine, the combination with a series of type-bars of an inelastic metal rest therefor provided with a facing of fibrous material.

5. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic metal faced with leather.

6. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic metal faced with tough, pliant, inelastic material.

7. In a type-writing machine, the combination with a type-bar of a rest therefor consisting of a body of inelastic metal and a facing of tougher pliant inelastic material.

8. In a type-writing machine, the combination with a series of radially-disposed type-bars of a curved bar of inelastic material forming a rest for said type-bars and faced by a strip of tougher, pliant material.

9. In a type-writing machine, the combination with a type-bar of a movable inelastic metallic member forming a rest therefor and having a facing of tough, pliant material.

10. In a type-writing machine, the combination with a type-bar of a movable inelastic metallic member forming a rest therefor and having a facing of tough, inelastic, pliant material.

11. In a type-writing machine, the combination with a series of type-bars of a bar of inelastic metal faced with inelastic belt-lacing and forming a rest for said type-bars.

12. In a type-writing machine, the combination with a series of type-bars of a curved bar of lead having a facing of yielding fibrous material and forming a rest for said type-bars.

13. In a type-writing machine, the combination with a series of type-bars of a bar of lead faced with inelastic belt-lacing and forming a rest for said type-bars.

14. In a type-writing machine, the combination with a series of type-bars of a rest therefor comprising portions of lead and fibrous material.

15. In a type-writing machine, the combination with a type-bar of a rest therefor consisting of lead faced with tougher pliant material.

16. In a type-writing machine, the combination with a type-bar of a movable rest therefor consisting of lead faced with tough material.

17. In a type-writing machine, the combination with a series of type-bars of a curved movable lead bar faced with tough material and forming a rest for said type-bars.

18. In a type-writing machine, the combination with a series of type-bars of a movable lead bar faced with tough, pliant, fibrous material and forming a rest for said type-bars.

19. In a type-writing machine, the combination with a series of type-bars of a ring of lead having a facing of inelastic belt-lacing and forming a rest for said type-bars.

20. In a type-writing machine, the combination with a series of type-bars of a ring of lead faced with tough, wear-resisting material, and forming a rest for said type-bars.

21. In a type-writing machine, the combination with a series of type-bars of a movable ring of lead faced with tough, pliant, wear-resisting material and forming a rest for said type-bars.

22. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic metal confined within a casing of inelastic pliant material.

23. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic metal incased in inelastic leather.

24. In a type-writing machine, the combination with a series of radially-disposed type-bars of a curved bar of pliant, inelastic material, overwound with a strip of tougher pliant material, and forming a rest for said type-bars.

25. In a type-writing machine, the combination with a series of type-bars of a bar of inelastic metal overwound with inelastic belt-lacing and forming a rest for said type-bars.

26. In a type-writing machine, the combination with a series of type-bars of a curved bar of lead overwound with tough material and forming a rest for said type-bars.

27. In a type-writing machine, the combination with a series of type-bars of a curved bar of lead overwound with inelastic belt-lacing.

28. In a type-writing machine, a type-rest consisting of lead incased in inelastic flexible material.

29. In a type-writing machine, a movable curved rest for type-bars, consisting of lead incased in pliant tough material.

30. In a type-writing machine, a movable type-rest consisting of a ring of lead inclosed in a casing of tough pliant material.

31. In a type-writing machine, a type-rest consisting of a ring of lead overwound with inelastic belt-lacing.

32. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic metal having a backing of stiff metal, the latter being fixed, and the inelastic metal being capable of a limited movement when struck by the type-bars.

33. In a type-writing machine, the combination with a type-rest consisting of inelastic metal and capable of limited movement under the impact of the type-bars, of a fixed rest for said movable rest.

34. In a type-writing machine, the combination of a series of type-bars, a curved pliant movable inelastic bar forming a rest therefor, and a fixed backing of stiffer metal.

35. In a type-writing machine, the combination of a series of type-bars, a movable lead rest therefor, and a fixed backing for the lead.

36. In a type-writing machine, the combination with a series of type-bars of a movable lead ring forming a rest therefor, and a fixed ring of stiffer metal inclosing said lead ring.

37. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic pliant metal faced with tough, pliant material and having a backing of stiff metal.

38. In a type-writing machine, the combination of a series of type-bars, a curved pliant inelastic metal bar forming a rest therefor and provided with a facing of tough pliant material, and a fixed bar forming a backing for said pliant bar.

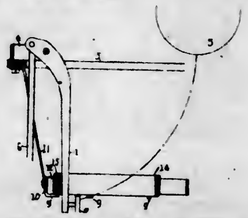
39. In a type-writing machine, the combination of a series of type-bars, a lead rest therefor faced with tougher pliant material, and a stiff backing for said rest.

40. In a type-writing machine, a type-bar rest consisting of flexible material housing a metal strip which is inelastic.

41. In a type-writer, in combination with the ends of the type-bars that carry the printing characters, a yielding non-resilient pad constructed of thin flexible metal yieldingly supported and arresting the type-bars without causing them to rebound.

42. A type-writer pad constructed of thin, flexible, but non-resilient, metal, yieldingly supported.

811,183. TYPE-WRITING MACHINE. BURNHAM C. STOCKNEY, Elizabeth, N. J., assignor to Underwood Typewriter Company, New York, N. Y., a Corporation of New Jersey. Original application filed Dec. 16, 1903. Serial No. 185,261. Divided and this application filed June 1, 1905. Serial No. 260,599.



Claim.—1. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of inelastic material confined within a casing of inelastic pliant material.

2. In a type-writing machine, a type-bar rest consisting of a casing and sand contained therein.

3. In a type-writing machine, a curved type-bar rest consisting of a casing of pliant material and a filling of granular material.

4. In a type-writing machine, the combination with a series of type-bars of a pliant member forming a rest for the type-bars, and a fixed member forming a backing for said pliant member, the latter being capable of a limited bodily movement under the impact of the type-bars.

5. In a type-writing machine, the combination with a series of type-bars of a rest therefor consisting of finely-divided material within a casing of pliant inelastic material, and a fixed curved bar forming a backing for said rest.

6. In a type-writer, a cushion constructed of a yielding sheath and a yielding and non-resilient filling, producing a pad that is absorbent of the energy of the blow struck by the type-bar, and non-resilient under said blow.

7. In a type-writer, a yielding inelastic cushion to support the type-bars in their normal position, consisting of a sheath, and a filling made of finely-divided material.

8. A type-bar cushion comprising a yielding

8. A type-bar cushion comprising a yielding striking-surface and an inherently non-resilient shock-absorbing medium beneath the striking-surface.

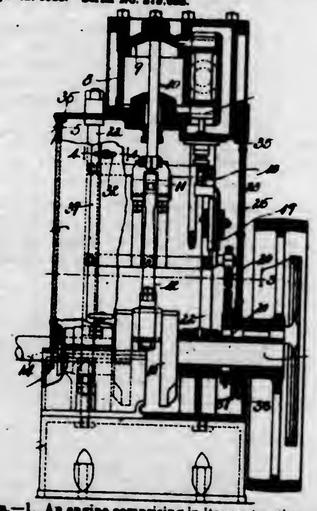
9. A type-bar cushion comprising a yielding striking-surface and an inherently non-resilient shock-absorbing medium beneath the striking-surface and movably supporting the same.

10. A type-bar cushion comprising a striking surface or facing of yielding material, said material being sufficiently yielding to prevent sudden arrest and consequent rebound or springing of the type-bars, and a non-resilient shock-absorbing backing for said facing, said backing being sufficiently non-resilient to absorb the energy of the returning type-bars, and being also movable so that both the facing and the backing may be displaced by the impacts of the type-bars; said cushion being sufficiently yielding and non-resilient to prevent injurious rebounding of the type-bars therefrom.

11. A type-bar cushion comprising a yielding facing of tough material, said facing being inelastic and pliant, and a yielding inelastic shock-absorbing backing; said cushion being sufficiently yielding, inelastic and shock-absorbing to prevent injurious rebounding of the type-bars.

12. A type-bar cushion comprising a facing of inelastic, pliant leather, and a yielding, inelastic shock-absorbing backing; said cushion being sufficiently yielding, inelastic and shock-absorbing to prevent injurious rebounding of the type-bars.

811,184. ENGINE. HENRY A. SWANTON, Roxbury, Mass. Filed Sept. 22, 1905. Serial No. 279,022.



Claim.—1. An engine comprising in its construction a cylinder, and a bed, in combination with a detachable casing comprising two side sections and two end sections, adapted to be fastened to the frame of said engine, each of said sections consisting of two sheets of metal fastened together and having an air-space therebetween, said sections extending across the space between said cylinder and bed and inclosing the moving parts of said engine located between said cylinder and bed.

2. An engine comprising in its construction a cylinder, a piston and a piston-rod, a main crank-shaft, connections from said main crank-shaft to said piston-rod, a bed in which said shaft is journaled, a frame consisting of a plurality of rods rectangular in cross-section connecting said bed and cylinder together, and a detachable casing comprising two side sections and two end sections fastened to said rods, each of said sections consisting of two sheets of metal fastened together and having an air-space therebetween, said sections extending across the space between said cylinder and bed and inclosing said moving parts of said engine, and metal bands fast to said side sections upon opposite edges thereof and projecting outwardly therefrom across the spaces between the adjacent edges of said side and end sections.

3. An engine comprising in its construction a cylinder, a piston and a piston-rod, a main crank-shaft, connections from said main crank-shaft to said piston-rod, a bed in which said shaft is journaled, a frame consisting of a plurality of rods rectangular in cross-section connecting said bed and cylinder together, and a detachable casing comprising two side sections and two end sections fastened to said rods, each of said sections consisting of two sheets of metal fastened together and having an air-space therebetween, said sections extending across the space between said cylinder and bed and inclosing said moving parts of said engine, recesses provided in said cylinder and bed into which the top and bottom of said sections, respectively, project, and a rib extending inwardly from the upper edge of said base, the inner sheets of said sections projecting downwardly along their lower edges against the inner face of said rib.

4. An engine comprising in its construction a cylinder, a piston and a piston-rod, a main crank-shaft, connections from said main crank-shaft to said piston-rod, a bed in which said shaft is journaled, a frame consisting of a plurality of rods connecting said bed and cylinder together, and a detachable casing comprising two side sections and two end sections fastened to said rods, each of said sections consisting of two sheets of metal fastened together and having an air-space therebetween, said sections extending across the space between said cylinder and bed and inclosing said moving parts of said engine, and oil-guards fast to said rods and extending longitudinally thereof adjacent to the inner faces of the inner sheets of said sections.

811,185. CHECK-VALVE. FRANK B. THE RICK, Auburn, N. Y. Filed Nov. 10, 1902. Serial No. 130,730.

Claim.—1. A check-valve for air-compressors comprising a shell having an inlet and valve-seat in one end and an outlet in one side and formed with a central bore, and an annular seat at one end of the bore between the inlet and outlet, a bushing having an air-tight fit in said bore and formed with a central guide-opening of less diameter than the inlet and communicating with the outlet, a valve playing between the inlet and adjacent end of the bushing and provided with an annular groove facing the valve-seat at the inlet, said valve having a hollow tubular stem fitting with an air-tight fit in the central opening of the bushing and having lateral passages leading from its interior to the annular groove, the interior of the tubular stem also communicating with the outlet.

2. A check-valve for air-compressors comprising a shell having an inlet and an outlet and provided with a valve-bore of greater diameter than the inlet, a bushing fitting in the shell and having a central opening of less diameter than the valve-bore, an inlet-valve fitting air-tight in the valve-bore and having an annular groove facing the valve-seat, said valve playing between the inlet and adjacent end of the bushing and having a hollow stem fitting with an air-tight sliding fit in the central opening of said bushing and having its interior communicating with said annular groove and outlet.

3. A check-valve comprising a shell having an inlet and an outlet, a valve seated in the inlet and having a lateral passage opening to the inlet when the valve is open, said valve having a sliding air-tight fit in the shell between the seat and outlet and provided with a reduced hollow stem having one end communicating with said passage and its other end opening to the outlet, and a bushing fitted air-tight in the shell and having a guide-opening receiving the valve-stem and forming an air-tight joint therewith, and an annular shoulder in the shell between the valve-seat and outlet to limit the endwise movement of the bushing, said bushing coöperating with the valve to limit its movement.

811,186. CLEAT AND SOCKET. CHARLES M. WAITE and CHARLES F. FRALICK, New York, N. Y. Filed Apr. 14, 1905. Serial No. 255,607.

Claim.—1. In a device of the character described, the combination with a two-part cleat, of a socket carried by one side of said cleat, terminals arranged in said socket and a pair of weatherproof rings, one of which lies between one of said terminals and the wall of said socket, and the other of which encircles said socket.

2. In a device of the character described, a two-part cleat formed of weatherproof material, the members of said cleat being provided with opposed shallow depressions in their engaging faces for the reception of an electrical conductor, said members being further provided with alined openings, means for securing the cleat to a fixed support and simultaneously exerting a clamping pressure upon said electrical conductor, a socket integral with one of the members of the said cleat, terminals to which electrical conductors may be secured, means for insulating one of the terminals from the walls of the socket, and means secured to the outside of the socket adapted to protect the metallic parts of the socket and the lamp held therein.

3. In a cleat for supporting electrical conductors, a pair of cleat members, a weatherproof socket secured to one of the members, electric conductors leading into the socket, terminals to which the conductors are secured, means for insulating one of the terminals from the walls of the socket, and means secured to the outside of the socket adapted to protect the metallic parts of the socket and the lamp held therein.

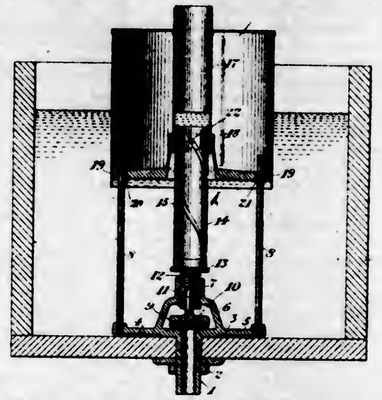
811,187. HOOK. WILLIAM S. WARD, Plantsville, Conn., assignor to H. D. Smith & Company, Plantsville, Conn., a Corporation. Filed May 17, 1905. Serial No. 260,573.

Claim.—1. A hook having a flattened shank and an integral head of the same size and form in side view as the adjacent portion of the handle, bosses on the sides of the said head, a handle-rod mounted in the said bosses, and handle-woods secured upon the said handle-rod on the opposite sides of the said head.

2. A hook having a shank and a head integral with the said shank, a handle-rod mounted in the said head and projecting in both directions therefrom, handle-woods mounted on the said handle-rod on each side of the said head, and caps on the ends of the said handle-rod to hold the said woods in place, the sides of the said head and caps being undercut and the ends of the handle-woods beveled to set into the said undercut sides.

3. A hook having a flattened shank and a head of the same size and form in side view as the adjacent portion of the handle, bosses on the sides of the said head having threaded holes, a two-part handle-rod, each part having one end screw-threaded to fit into the said bosses, and having a cap at its other end, and handle-woods secured upon the two parts of the said handle-rod.

811,188. FLUID-LEVEL-CONTROLLING MEANS. JOHN B. WARING, East Orange, N. J., assignor to Waring Patents Company, New York, N. Y., a Corporation of New York. Filed Mar. 11, 1904. Serial No. 197,734.



Claim.—1. Means for controlling the fluid-level of a reservoir comprising a float, a valve member, a stationary member having a helical engagement with the valve member and supporting the member to travel axially in a substantially vertical direction, when rotated, and a valve controlled by the valve member, the float having a direct connection with the valve member whereby the rise and fall of the float will operate the valve member in its support and control the valve.

2. Means for controlling the fluid-level in a reservoir comprising a float member, guiding means for restraining the rotation thereof, a rotatable valve member, the float member and valve member having a helical engagement, and a valve controlled by the valve member.

3. Means for controlling the fluid-level of a reservoir comprising a hollow inverted float member, guiding means for restraining the rotation thereof, a rotatable valve member arranged to enter within the hollow float member, the float member and valve member having a helical engagement, and a valve controlled by the valve member.

4. Means for controlling the fluid-level of a reservoir comprising a float member, guiding means for restraining the rotation thereof, a rotatable valve member, the float member and valve member having a helical engagement, a threaded part on the valve member and a threaded stationary socket therefor, and a valve controlled by the valve member.

5. Means for controlling the fluid-level of a reservoir comprising a hollow inverted float member, guiding means for restraining the rotation thereof, a rotatable valve member arranged to enter within the hollow float member, the float member and valve member having a helical engagement, a threaded part on the valve member and a threaded stationary socket therefor, and a valve controlled by the valve member.

6. Means for controlling the fluid-level of a reservoir comprising a float member, guiding means for restraining the rotation thereof, a rotatable valve member, the float member and valve member having helical engagement, whereby the rise and fall of the float member is converted into rotary movement of the valve member, a stationary socket for the valve member, the valve member and socket having a helical engagement of a pitch considerably less than that of the helical engagement of the float member and valve member, whereby the rotary movement of the valve member is converted into a rise and fall of the valve member of considerable less extent than the rise and fall of the float member, and a valve controlled by the valve member.

7. Means for controlling the fluid-level of a reservoir comprising a hollow inverted float member, guiding means for restraining

the rotation thereof, a rotatable valve member arranged to enter within the hollow float member and having helical engaging parts, the float member having means coacting with the helical engaging parts of the valve member to convert the rise and fall of the float member into rotary movement of the valve member, a stationary socket for the valve member, the valve member and socket having helical engaging parts of a pitch in the same direction as and considerably less than that of the helical parts engaged by the float member, whereby the rotary movement of the valve member is converted into a rise and fall of the valve member with augmentation of the rotative effect due to the rise and fall of the float member, and a valve controlled by the valve member.

8. The combination, with a fluid-reservoir, of a hollow inverted float having a cross-piece at its lower end, guiding means for restraining the rotation of the float, a rotatable valve member arranged to enter within the hollow float, the cross-piece of the float and the rotatable valve member having a helical engagement, and a valve controlled by the valve member.

9. The combination with a fluid-reservoir, of a hollow inverted float having a cross-piece at its lower end, guiding means for restraining the rotation of the float, a rotatable valve member having helical slots, the cross-piece of the float having projecting means engaging such helical slots, and a valve controlled by the valve member.

10. The combination with a fluid-reservoir, of a hollow inverted float having a cross-piece at its lower end, guiding means for restraining the rotation of the float, a rotatable valve member having helical slots, the cross-piece of the float having projecting means engaging such helical slots, a threaded part on the valve member and a threaded stationary socket therefor, and a valve controlled by the valve member, substantially as set forth.

11. The combination with a fluid-reservoir, of a hollow inverted float having a cross-piece at its lower end, guiding means for restraining the rotation of the float, a rotatable valve member having helical slots, the cross-piece of the float having projecting means engaging such helical slots, whereby the rise and fall of the float is converted into rotary movement of the valve member, a stationary socket for the valve member, the valve member and socket having helical engaging parts of a pitch in the same direction as but considerably less than that of the helical slots, whereby the rotary movement of the valve member is converted into a rise and fall of the valve member with augmentation of the rotative effect due to the rise and fall of the float, and a valve controlled by the valve member

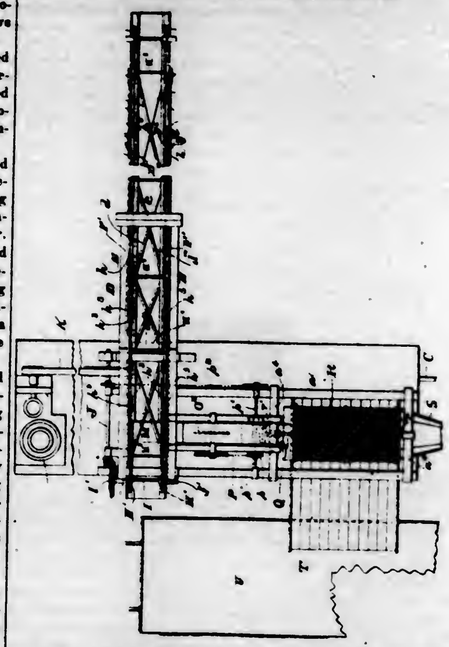
12. The combination with a fluid-reservoir, of a float consisting of a hollow inverted cup with a centrally-piercing tube and a cross-piece connecting the cup and tube at their lower ends, guiding means for restraining the rotation of the float, a rotatable valve member arranged to telescope within the tube of the float and having helical slots, the cross-piece of the float having projecting means engaging such helical slots, a stationary threaded socket for the valve member and a threaded part on the valve member engaging such threaded socket, and a valve controlled by the valve member, substantially as set forth.

811,189. CONVEYING AND ELEVATING APPARATUS. ALFRED J. WIMPENNY, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Nov. 30, 1897. Serial No. 660,576.

Claim.—1. The herein-described traveling conveyer mechanism, having the main upwardly-projecting frame, mounted upon track-wheels, the conveyer-frame connected to the main frame, extending across it, and to points inside of the portable frame, and having a horizontally-arranged loading-receptacle or conveyer-trough, the truss-frame which engages with and bears upon the main frame, and is connected to the inner end of the conveyer-frame, a conveyer mechanism operating in said trough, and means for delivering material from the conveyer, substantially as set forth.

2. The combination of a support mounted upon trucks, a conveyer mounted on the said support and extending laterally beyond one side thereof, the lower run of said conveyer comprising a trough, flights operating in the said trough, a stationary chute extending from the side of the movable support opposite to that beyond which the conveyer extends, another chute arranged to deliver material beyond one end of the movable support, and means for delivering the material carried by the conveyer to the said chutes, substantially as set forth.

3. In a conveyer, the combination of the supporting-frame having the upper, straight, side bars, the lower bowed side bars, transverse braces connecting the said upper bars, similar braces connecting the lower bars, and vertically-extending braces connecting the upper and lower bars, guide-rails carried by said frame and extending parallel with the upper and lower bars thereof, a trough-like receptacle, A^6, supported by and curved longitudinally to conform to the lower portion of said supporting-frame, endless chains passing around guiding and driving wheels adjacent to the ends of the supporting-frame, and provided at intermediate points of their length with rollers adapted to travel along the aforesaid guide-rails, and scraper-flights connected to said chains and shaped to conform to the cross-sectional form of the trough, A^5, through which they travel on the lower "run" of the conveyer, substantially as set forth.



4. In a conveyer, the combination of two parallel chains each formed of wheel-supporting links, A^2, strap-links, A^1, and connecting links, A, formed by parallel bars pivotally connected at their ends to the aforesaid links, A^2, A^1, bars, H^3, extending transversely across the space between the said chains, the ends of each of said transverse bars being bent upon the body thereof and secured between the top and bottom bars of opposite strap-links, A^1, and flights, H^1, secured to said bars, H^3, a trough wherein said flights operate, and means for supporting said trough, substantially as set forth.

5. In an apparatus for the purpose specified, the combination of a truck, a conveyor extending laterally beyond one side thereof and having a horizontally-arranged trough or receptacle for receiving the load from shovels, two independent chutes for delivering material at different points, an elevator for taking the material from the conveyer, means for directing the material from the elevator to the said chutes, and an engine on the truck arranged to operate both the conveyer and the elevator, substantially as set forth.

6. In an apparatus for the purpose described, the combination of a truck, a conveyor having its frame extending laterally beyond one side of the truck and having its lower run arranged substantially horizontal, whereby the said run can be directly loaded, a truss-frame for supporting the said conveyer mounted upon the truck, wheels or rollers carried by and adapted to assist in supporting the conveyer-frame, means for delivering the material at different points, means for directing the material from the conveyer to the said delivering means, and an engine on the truck arranged to operate the conveyer, substantially as set forth.

7. In an apparatus for conveying material from a culm-pile, the combination of a movable support adapted to travel parallel to one face or edge of the pile, a conveyor extending out beyond one side of the truck and at substantially right angles thereto, having a substantially horizontal loading portion, ground wheels or rollers carried by the conveyer-frame near its outer end, and means for delivering the material carried by the conveyer, substantially as set forth.

8. The combination of a supporting-frame, the conveyer-frame projecting laterally therefrom, the conveyer thereon having a lower run and an upper run, the lower run having a trough the outer portion of which is approximately horizontal, and the inner end portion of which is inclined, said outer end portion constituting an elongated receptacle for the load, and means on the frame for actuating the conveyer, substantially as described.

9. The combination of the supporting-frame, having the guideways at its upper side and curved or bowed guideways at its bottom, endless chains mounted on wheels supported in said frame and extending along said guideways, a trough arranged between the lower curved guideways, and scrapers or flights connected with the chains and traveling in said trough, substantially as set forth.

10. The combination of the main frame, the conveyer-frame mounted on and projecting beyond the side of the main frame, the conveyer-chains on suitable sprockets, the scraper-flights secured to said chains, the conveyer-trough carried by said projecting frame, and having a substantially horizontal portion near its outer end for initially receiving the load, and also receiving the conveyer-flights on the chain, and having an inclined part near the inner end, substantially as set forth.

11. In a conveyer, the combination of a frame, formed of the parallel, straight, upper side bars, the lower longitudinally curved or bowed, side bars, and the connecting-bars joining said top and bottom side bars, a pair of endless chains extending along suitable guides on the inner faces of said top and bottom side bars, a trough or receptacle connecting the lower, curved side bars, and scraping-flights attached to the chains and adapted to travel through said trough, substantially as set forth.

12. The combination of a supporting-frame, a conveyer-frame projecting laterally therefrom, a conveyer therein having a lower run and an upper run, the lower run having a trough approximately horizontal near its outer end and inclined at its inner end, said outer portion constituting an elongated receptacle for the load, means on the frame for actuating the conveyer, and means for adjusting said outer end of the conveyer up and down, substantially as set forth.

13. In a conveyer apparatus the combination of a frame, an endless conveyer supported thereby and extending out to one side thereof, such outward-extending portion having a relatively long substantially horizontal loading portion, means for adjusting the outwardly-extending portion of the conveyer up and down and supports under the loading portion of the conveyer, substantially as set forth.

14. The combination of a main frame, an endless conveyer supported at one end by such frame and extending out beyond one side thereof, the said outward-extending portion of the conveyer having a relatively long and substantially horizontal loading portion, and the end that is connected to the main frame being inclined, and the outer end of the conveyer being free to be adjusted vertically, and a support supplemental to the main frame for the outer end of the conveyer, substantially as set forth.

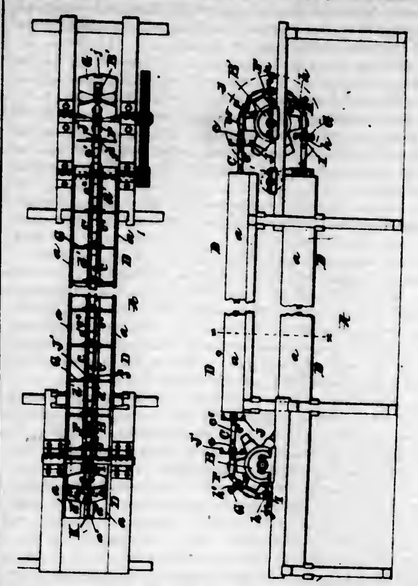
15. The combination of a main frame, a conveyer supported therein and extending laterally to one side thereof, supports independent of the main frame arranged below the outer portion of the conveyer, and a cable extending from the main frame to the outer portion of the conveyer, and means for adjusting the cable, substantially as set forth.

16. In a conveyer, the combination of a pair of parallel chains comprising links A^5 which are formed of a bar or strap of metal shaped into an endless loop whereby are formed upper and lower bars, the cross-bars H^3 the ends of which are bent upon themselves to form heads that are arranged to fit closely between the said upper and lower bars of the opposite links, means for uniting the said links and cross-bars, and flights carried by the said cross-bars, substantially as set forth.

811,190. CONVEYER. ALFRED J. WIMPENNY, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Dec. 2, 1897. Serial No. 660,889.

Claim.—1. In a conveyer, the combination with the chain, of the flights formed of sheet metal secured to the chain and extending both above and below the chain, guides secured to the outer edges of the flights, and substantially in the longitudinal plane of the chain, and a stationary guide with which the flight-guides engage, substantially as set forth.

2. In a conveyer, the combination of a chain, a series of flights secured thereto, guides carried by the flights and arranged in substantially the longitudinal plane of the chain, and a stationary supporting-guide with the upper surface of which said flight-guides engage arranged in a plane different from that in which the chain moves, the said guides being arranged to support the flights from sliding engagement with the trough, substantially as set forth.



3. In a conveyer, the combination of a trough, an endless chain, a series of flights secured to the chain, the chain being above the working edge of the flights, and the chain and flights normally tending under the action of gravity to press toward the bottom of the trough, and a support and guiding bar with which the flights engage, said bar being arranged in substantially the vertical plane of the chain and projecting above the top of the trough-bottom, substantially as set forth.

4. The combination of a trough, the chain arranged to move adjacent to the trough, a series of flights rigidly connected to and carried by the chain, a series of guides secured to the working edges of the flights, and a stationary guide for supporting the flights above the bottom of the trough with the upper surface of which the flight-guides engage, the chain being so connected with the flights as to be situated above the stationary supporting-guide, substantially as set forth.

5. The combination of a trough, a stationary guide arranged in the bottom of the trough and projecting above the lower portion thereof, the chain arranged to move adjacent to the trough, and a series of flights carried by the chain, the working edges of the flights being constructed to engage with the stationary guide in the bottom of the trough, substantially as set forth.

6. In a conveyer, the combination of a trough having side walls and a bottom wall, an endless chain, flights rigidly secured to the chain and arranged to normally bear down toward the trough-bottom under the gravity of the chain, and a supplemental support for the flights and the chain situated between the ends of the flights substantially parallel with the trough and arranged to sustain the flights and chain out of wearing contact with the trough, substantially as set forth.

7. In a conveyer, the combination of an endless chain, flights secured to the chain, a trough through which the flights move having side walls and bottom walls sloping toward the center, and a supplemental flight-support arranged centrally of the trough and having an upwardly-extending convex bearing-face adapted to maintain in conjunction with the trough-bottom an unbroken surface for supporting the material and arranged to sustain the flights out of wearing contact with the trough-bottom, substantially as set forth.

8. In a conveyer, the combination of a trough having side and bottom walls formed of sheet metal, and a central guiding and weight-supporting bar supported independently of the walls of the trough and arranged between sections of the bottom of the trough, substantially as set forth.

9. In a conveyer, the combination with a trough, of an endless moving carrier member, and flights secured thereto and arranged transversely to the carrier member and having at their lower ends projecting annular bearing-shoulders, and the other member being provided therein with bearing-sockets receiving said shoulders, said

are engaged and disengaged through rotary or axial movement of the

3. In a mechanism for screening ores and other material, the

9. In a conveyer, the combination with a trough, of an endless moving carrier member, and flights secured thereto and arranged transversely to the carrier member and having at their lower edges shoe-like supports arranged to support the flights and carrier member and hold the lower edges of the flights out of scraping contact with the trough, substantially as set forth.

10. In a conveyer, the combination with the trough for supporting the material, of a stationary supporting-guide situated along the central longitudinal lines of the trough, a single chain in the center, longitudinally, of the trough and above the guide, and the flights secured to said single chain, each flight having an elongated guide at its center transversely, and arranged to rest upon the upper surface of the central supporting-trough guide, substantially as set forth.

11. In a conveyer, the combination with the trough having a stationary guide on its central longitudinal line, the movable flight, and the chain secured to said flight, of the guide secured centrally to the lower edge of the flight and having the elongated guide part f^3 adapted to engage with the trough-guide, substantially as set forth.

12. In a conveyer, the combination of a chain having alternate double-bar links c' and single-bar links c, of the flights, and the flight attachments H secured to the single-bar links, each formed separately from its link with a tubular socket h through which the link is passed, the bolt for fastening the socket to the bar, and each attachment fastened to its flight, substantially as set forth.

13. In a conveyer, the combination with the chain, of the flight which widens from its ends toward its center and having a recess cut out of its lower edge, and a guide-block secured to said lower edge and having an elongated guide with a passage registering with the recess on the edge of the flight, substantially as set forth.

14. In a conveyer, the combination of the flight or material transporting device, the separately-formed attachment joined to the flight for securing it to the chain, the link C adapted to be secured to the said attachment and formed with the pintle-aperture c^2, the link c' having the side bars c^4, c^5, with pintle-apertures near the ends, and the pintle F having the central cylindrical rocking bearing-surface within the pintle-aperture at c^2 in the link c and having the flattened or web-like parts fitting to the correspondingly-shaped pintle such as in the side bars c^4, c^5, and said pintle at the ends being upset or riveted, whereby the material transported by the conveyor is prevented from entering the pintle-seats and the pintle is compelled to rock in the central link-bar C, substantially as set forth.

15. In a conveyer, the combination of flights having apertures through their central portions, and a chain formed of articulated links, comprising flight-carrying links of a size and shape to fit the said apertures in the flights, and permit the flights to be passed longitudinally over the same from the ends of the links to the places of the attachment of the flights thereto, substantially as set forth.

16. In a conveyer, the combination of a chain formed of articulated links, comprising flight-carrying links c formed of bars of uniform size and shape from end to end, and flights arranged to be secured to such links c, and having apertures through their central portions of a size and shape to closely fit the said bars, substantially as set forth.

17. In a conveyer, the combination with the flights, each narrowing from the center toward the ends transversely, and formed of relatively thin metal, and having an aperture at the center, of a chain passing through the said central aperture, an attachment secured to each flight and secured to the chain, and supporting attachments for the flight secured to it at points between its ends, and in the vertical central longitudinal planes of the conveyer, substantially as set forth.

18. The combination with the flight and the chain passing centrally through the flight, of the attachment J secured to the rear side of the flight and adapted to support it against edge thrust, and the attachment H secured to the rear side of the flight and secured to the chain, substantially as set forth.

19. In a conveyer, the combination of a chain, a series of transversely-arranged flights secured thereto, a stationary supporting-guide arranged adjacent to and parallel with the path followed by the chain, and guides secured to the flights and arranged to engage with the said stationary supporting-guide, the guides carried by the flights being elongated in a direction parallel with the chain and having engagement with the stationary guide that tends to prevent twisting of the flights, substantially as set forth.

811,191. PULLEY-BLOCK. FRANK P. WHITEMAN, Youngstown, Ohio. Filed May 16, 1905. Serial No. 260,967.

Claim.—1. A pulley-block comprising a body member and a wheel member, one of said members having rigid therewith opposite projecting annular bearing-shoulders, and the other member being provided therein with bearing-sockets receiving said shoulders, said registering shoulders and recesses constituting the sole journal-support and bearing for the wheel member.

2. A pulley-block comprising a body member and a wheel member, one of said members having opposite projecting annular bearing-shoulders, and a hollow journal-stud, and the other of said members having opposite bearing-sockets receiving the said shoulders.

3. A pulley-block comprising a block-body consisting of separably-interlocked sections provided with rigid annular bearing-shoulders, and a sheave or wheel member mounted within the block-body and having bearing-sockets receiving said shoulders.

4. A pulley-block comprising a block-body having a wheel-opening and consisting of separate members having a central trunnion connection and interlocking elements slidably engaged and disengaged through rotary or axial movement of said sections, and a sheave mounted within the wheel-opening of the block-body.

5. A pulley-block comprising a block-body consisting of separate cheek-plates having a central trunnion connection and at the ends provided with slidably-interlocked elements moved into and out of engagement through rotary or axial movement of the cheek-plates, and the sheave having a bearing within the body independent of the trunnion action.

6. A pulley-block comprising a block-body consisting of opposite cheek-plates having a central trunnion connection and provided at the ends respectively with interlocking tongues and grooves, and a sheave having a bearing-mounting within the block-body, independent of the trunnion connection.

7. A pulley-block comprising a block-body consisting of opposite cheek-plates, one of which is provided at its ends with headed retaining-tongues, and the other of which is provided in corresponding positions with shouldered holding-grooves receiving and interlocking with said tongues, the interlocking tongues and grooves being arranged concentric with the wheel-axis, and the sheave or wheel member mounted within the block-body.

8. A pulley-block comprising a block member consisting of separate cheek-plates having a central trunnion connection and opposite matching end members, the end members of one of the cheek-plates being provided with headed retaining-tongues extending transversely and arranged on a curve concentric with the trunnion connection, and the other of said members being provided with correspondingly-shouldered holding-grooves receiving the said tongues, and the sheave or wheel member mounted within the block-body.

9. A pulley-block comprising a block-body provided at one end with a bridle attachment and consisting of separably-interlocked cheek-plates, and the sheave mounted within the block-body.

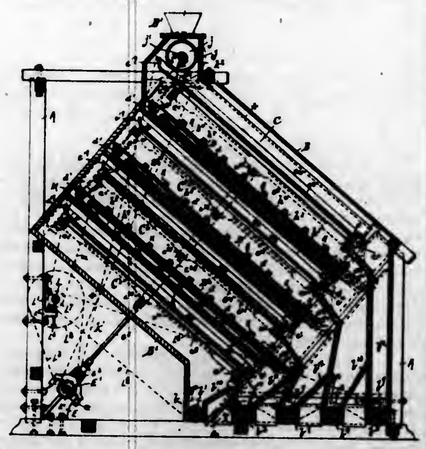
10. A pulley-block comprising separably-interlocked cheek-plates, one of which is provided with a bridle attachment having a separably-interlocked connection with the other cheek-plate, and the sheave mounted within the block-body.

11. A pulley-block comprising a sectional block-body consisting of separate cheek-plates having interlocked connections which are engaged and disengaged through rotary or axial movement of the plates, one of said cheek-plates being provided with a bridle attachment having an interlocked connection with the other cheek-plate, said latter interlocked connection being also engaged and disengaged through the said rotary or axial movement of the cheek-plates, and the sheave.

12. A pulley-block comprising a block-body having opposite cheek-plates provided with centrally-located inwardly-projecting annular bearing-shoulders, one of said plates being further provided at the center in its inner side with a retaining-socket, and the other of said plates being further provided with an offstanding journal-stud having one end thereof engaged in said socket, and a sheave or wheel member having a central bearing-opening receiving the journal-stud and also provided at opposite sides of its hub with circular bearing-sockets receiving said annular bearing-shoulders.

13. A pulley-block comprising a block-body having opposite cheek-plates provided at the center with inwardly-projecting annular bearing-shoulders and at the bases of the bearing-shoulders with offset clearance-shoulders, one of said cheek-plates being further provided with a retaining-socket and the other of said plates being provided with a journal-stud fitting in said socket, the sheave or wheel member having its hub arranged between such clearance-shoulders and provided with a central bearing-opening receiving the journal-stud and with opposite bearing-sockets receiving the annular bearing-shoulders, and a retaining and adjusting device engaging one end of the journal-stud and the adjacent cheek-plate.

811,192. SEPARATOR. FREEMAN R. WILLSON, Jr., Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Nov. 20, 1901. Serial No. 83,210.



Claim.—1. In a screening mechanism for ore or similar materials, the combination of the series of inclined superposed screens, the longitudinally-reciprocating actuating devices pivotally connected to and arranged to support each screen of said series near its center, the ends of each screen being free to vibrate about the axis of the screen's pivotal connection with said reciprocating device independent of the vibration of the ends of any other screen of the series, and the series of vibrating sustaining devices, each pivotally connected to the central part of one of said screens and also connected to a relatively stationary support, substantially as set forth.

2. In a mechanism for screening ores or other material, the combination of the series of inclined superposed screens, the pair of longitudinally-reciprocating actuating devices arranged one at either side of said series of screens and pivotally connected to each screen of said series near its center, the ends of each screen being free to vibrate about the axis of its pivotal connection with said reciprocating device independent of the vibration of the ends of any other screen of the series, said reciprocating actuating device being arranged to bodily reciprocate said series of screens in planes at an angle to the planes of the flow of material along the screens and the series of vibrating sustaining devices each flexibly connected to one of said screens and also connected to a relatively stationary support, substantially as set forth.

3. In a mechanism for screening ores and other material, the combination of the series of inclined superposed screens, each free at its ends to permit vertical vibration thereof, a longitudinally-reciprocating bar connecting the screens of the said series and adapted to bodily reciprocate the said series of screens, a main frame, a series of vibrating links or rods pivotally connected to the main frame and each pivotally connected to one of the screens near its center, substantially as set forth.

4. In a mechanism for screening ores or like material, the combination of the main frame, the series of inclined screens, each free at its end for vertical vibration, the reciprocating mechanism connected flexibly to the central parts of the screens respectively and adapted to bodily reciprocate the said series of screens, and the sustaining bars or rods pivotally connected to the main frame and pivotally connected to the central part of the screens respectively and situated approximately parallel to the screens, substantially as set forth.

5. In a screening mechanism for ores and like material, the combination of a series of inclined superposed screens, the power-shaft arranged beneath said series of screens, the bars connected to each screen of the series near its longitudinal center, means interposed between said power-shaft and said bars for reciprocating the bars and the screens connected thereto, and means for sustaining said series of screens from downward movement about the axis of said power-shaft beyond a predetermined limit and arranged substantially as set forth to permit the free vibration of the screens bodily without resistance from said sustaining means.

6. In a mechanism for screening ores or like material, the combination of the main frame, the series of inclined superposed screens, each free at its ends for vertical vibration, the bars arranged at either side of said series of screens and pivotally connected to each screen of the series near its center, the power-shaft arranged beneath the lowermost screen of the series, power-transmitting devices interposed between said power-shaft and the lower ends of said bars for reciprocating the bars and the screens connected thereto, and the sustaining-links pivotally connected to the main frame, and each pivotally connected to one of the said screens near its center and arranged to permit the free vibration of the series of screens bodily while preventing its downward movement about the axis of said power-shaft beyond a predetermined limit.

7. In a mechanism for screening ores and similar material, the combination of a series of inclined superposed screens, each free at its ends to permit vertical vibration thereof, a reciprocating actuating mechanism connected to the central part of each screen of the series, and a series of endless conveyers, each conveyer being arranged under one of the said inclined screens and adapted to carry upward the material passing through it and deliver it to the upper end of the screen passing below the conveyer, substantially as set forth.

8. In a mechanism for screening ore and similar material, the combination of the main frame, the casing, the supplemental frame secured to the main frame and arranged therein at an inclination substantially as set forth, a series of reciprocating screens in the said supplemental frame and casing inclined substantially as set forth, an actuating mechanism connected with each screen of the said series at the central part thereof and situated outside the said casing, the sustaining devices for the screens pivotally connected to the said framework and also pivotally connected to the central parts of the screens respectively, and the series of endless conveyers in the said supplemental frame and housing, each arranged between a screen and an adjacent one and adapted to carry the material passing through the upper screen and deliver it to the upper end of the lower one, substantially as set forth.

811,193. MERCURY SALTS OF CHOLIC ACID AND PROCESS OF MAKING SAME. EMIL WORMS, Berlin, Germany, assignor to the Firm of J. D. Riedel Aktiengesellschaft, Berlin, Germany. Filed June 9, 1905. Serial No. 264,804. (Specimens.)

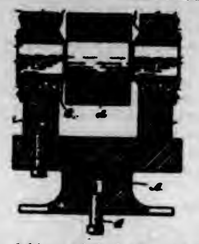
Claim.—1. The process for obtaining mercury salts of cholic acid, which consists in treating a suitably-dilute solution of a salt of cholic acid with a mercury salt of an organic acid to form a precipitate, and mechanically separating the latter, substantially as described.

2. The process for obtaining mercury salts of cholic acid, which consists in treating a suitably-dilute solution of a salt of cholic acid with a mercury salt of acetic acid to form a precipitate and mechanically separating the latter, substantially as described.

3. As a new product of manufacture, a mercury salt of cholic acid, having the shape of a light yellowish-white powder sparingly soluble in pure water, yielding an oxid of mercury on the addition of

an alkali and undergoing decomposition on the addition of alcohol, substantially as described.

811,194. SCALE PIVOT-BEARING. JAMES A. BARCLAY, Indianapolis, Ind. Filed Nov. 23, 1904. Serial No. 234,236.



Claim.—1. A weighing-scale including a housing, a knife-edge pivot in the housing, a bearing movable freely in the housing and having a curved bearing-surface in engagement with the knife-edge of the pivot, rollers coöperating with the housing and the bearing, and a lever or beam secured to the knife-edge pivot.

2. A weighing-scale including a movable housing having an annular bearing mounted movably therein with rollers coöperating with the housing and the bearing, a V-shape pivot having the knife-edge thereof in contact with the annular bearing, and a lever or beam secured to the pivot adjacent to the annular bearing.

3. A weighing-scale including a supported housing having a circular bore of uniform diameter, an annular bearing movable in the bore of the housing and having a bore of uniform diameter, rollers between the exterior of the bearing and the wall of the housing and retained therein by said bearing, means attached to the housing retaining the bearing therein, a knife-edge pivot having the edge thereof in contact with the bore of said bearing with a lever or beam secured to the pivot adjacent to and guided by said bearing, said bearing having a conical annular end presented to said lever or beam.

4. In a weighing-scale, an improved annular bearing having an unobstructed interior of uniform diameter and having a groove in the exterior thereof, the bearing being longer at the inner side than at the outer side thereof, in combination with rollers in said groove supporting the bearing movably, a knife-edge pivot engaging the interior of said bearing, and a lever or beam secured to the pivot adjacent to the bearing with a projection thereof coöperating with the longer portion of said bearing.

5. In a weighing-scale, the combination with a lever or beam and with a knife-edge pivot thereon, of a housing having rollers coöperating therewith, a bearing coöperating with the rollers of the housing and having a curved bearing-surface in engagement with the knife-edge of the pivot.

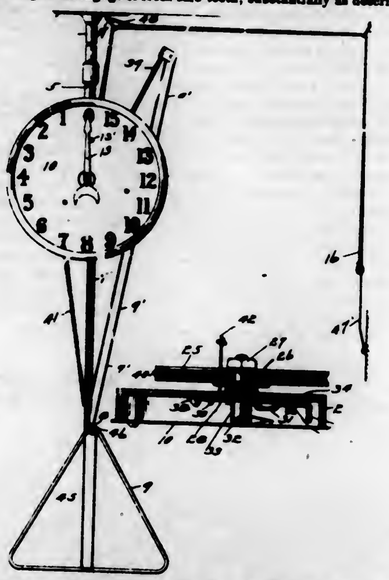
6. In a weighing-scale, the combination with the levers and beams and the knife-edge pivots thereof, of housings supported by the scale structure, bearings movable in the housings in engagement with the knife-edges of the pivots and guiding the levers and beams, rollers in the housings supporting the bearings and retained therein by the bearings, and means for retaining the bearings in the housings.

811,195. REGISTER FOR POOL-TABLES. GEORGE C. BEIN, Beavercreek, Minn. Filed Aug. 17, 1904. Serial No. 221,264.

Claim.—1. In a pool-table register, the combination, with a dial and a pointer, of a spring-actuated member, a pool-table triangle having a flexible connection with said member, means for locking said member against the tension of its spring at the limit of its movement in one direction, and a mechanism arranged to be set by each movement of said member for actuating said pointer when said member is released by the movement of said locking means.

2. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel upon the hub of which said pointer is secured, means for moving said wheel step by step in one direction, a dog 15 arranged to engage the teeth of said wheel and normally lock it against backward movement, a plate 19 loosely mounted on the hub of said wheel, a lug 22 carried by said wheel and adapted to engage said plate and move it under said dog to disengage the same from said teeth, and a lug 20 also arranged to engage said plate and return it to its normal position, substantially as described.

3. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel on the hub of which said pointer is secured, means for revolving said wheel to put said spring under tension, a dog 15 normally engaging the teeth of said wheel to prevent its backward movement, a loosely-mounted plate 19, lugs 20 and 24 between which said plate is movable, and means arranged to engage said plate and move it under said dog to disengage it from said teeth, substantially as described.



4. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel connected with said pointer, means for preventing backward movement of said wheel, a wheel 25 having a laterally-extending operating-arm 39, a pool-table triangle having a flexible connection with said rod, a spring connected with said wheel 25 and normally tending to hold said rod in its raised position, a latch 42 arranged to enter a notch provided in the wheel 25 and lock said rod in its depressed position, and mechanism set by the depression of said rod for actuating said ratchet-wheel when said latch is released, substantially as described.

5. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a ratchet-wheel connected with said pointer, a wheel 25 provided with a radial rod 39, a triangle having a flexible connection with said rod, a spring connected with said wheel 25 and normally tending to hold said rod in its raised position, means for temporarily locking said rod in its depressed position, and means arranged to be set by the rotation of the wheel 25 and the depression of the rod 39 for moving said ratchet-wheel step by step when said locking means is released, substantially as described.

6. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel connected with said pointer, a pool-table triangle, an oscillating rod having a flexible connection with said triangle, a spring arranged to be put under tension by the movement of said rod in one direction, means for locking said rod at the limit of its movement in one direction, and a mechanism arranged to be set by such movement of said rod for actuating said ratchet-wheel step by step when said rod is released by the movement of said locking means.

7. In a pool-table register, the combination, with a dial and a movable pointer therefor, of an oscillating rod, a pool-table triangle having a flexible connection with said rod, a spring arranged to hold said rod in its normal inoperative position, locking means arranged to hold said rod at the limit of its movement in one direction against the tension of said spring, and mechanism set by such movement of said rod for actuating said pointer when said rod is released by the movement of said locking means.

8. In a pool-table register, the combination, with a dial and a pointer therefor, of an operating-rod, a pool-table triangle having a flexible connection with said rod, a wheel 25 having a notch in its periphery, a spring connected with said wheel and put under tension by the depression of said rod, a locking-latch arranged to enter said notch when said rod is depressed, and mechanism set by the depression of said rod for moving said pointer step by step when said wheel and rod are released by the operation of said locking means.

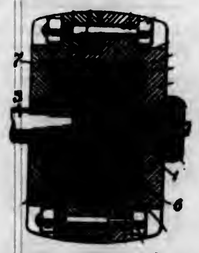
9. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel connected with said pointer, an operating-rod 39, a pool-table triangle having a flexible connection with said rod, a spring arranged to hold said rod in its raised position, a bell-crank lever 31 having means to engage the teeth of said ratchet, a disk 28 having a lug 29 arranged to be set by the depression of said rod 39 to engage said bell-crank and actuate it and said ratchet-wheel when said rod is released.

10. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet-wheel connected with said pointer, a wheel 25 having a notch in its periphery, a spring connected with said wheel 25, a pool-table triangle operatively connected with said wheel 25, a locking-latch arranged to enter said notch, and mechanism set by the partial revolution of said wheel 25 for actuating said ratchet-wheel when said locking-latch is released, substantially as described.

11. In a pool-table register, the combination, with a dial and a pointer arranged to move over the same, of a spring-actuated ratchet connected with said pointer, a spring-actuated wheel 25, a pool-table triangle operatively connected with said wheel 25, means for locking said wheel 25 at the limit of its movement in one direction against the tension of its spring, and mechanism set by the movement of said wheel in one direction for actuating said ratchet-wheel and pointer when said wheel returns to its normal position upon the disengagement of said locking means, substantially as described.

12. In a pool-table register, the combination, with a dial and a pointer, of a spring-actuated oscillating rod, a pool-table triangle having a flexible connection with said rod, means for locking said rod against the tension of its spring at the limit of its movement in one direction, and mechanism for actuating said pointer when said rod is released.

811,196. CYLINDER FOR TREATING HEATED METAL. GEORGE H. BENJAMIN, New York, N. Y., assignor to The Cox Brass Manufacturing Company, a Corporation of Connecticut. Filed May 15, 1903. Serial No. 157,268.



Claim.—1. A container for treating heated metal under pressure, comprising a cylinder, a winding of insulated wire thereon, and an inclosing jacket.

2. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and a non-heat-conducting covering for the winding.

3. A container for treating heated metal under pressure, comprising a wire-wound cylinder, an inclosing jacket therefor, and a non-heat-conducting covering for the winding.

4. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and a body of non-heat-conducting material interposed between the coils and the cylinder.

5. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and a body of non-heat-conducting material interposed between the coils of the winding.

6. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and a body of non-heat-conducting material dividing the winding into a series of equispaced coils.

7. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and a body of non-heat-conducting material interposed between the turns of the winding.

8. A container for treating heated metal under pressure, comprising a cylinder, a series of spaced coils of insulated wire wound thereon, and an inclosing jacket.

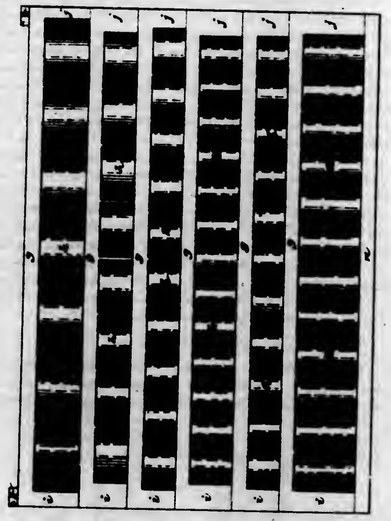
9. A container for treating heated metal under pressure, comprising a wire-wound cylinder, and an inclosing jacket therefor formed of telescoping sections.

10. A container for treating heated metal under pressure, comprising a wire-wound cylinder, an inclosing jacket therefor formed of telescoping sections, and means for securing the sections together.

11. A container for treating heated metal under pressure, comprising a cylinder, a winding of asbestos-covered wire upon the cylinder, a sectional jacket inclosing the winding, and means for securing the sections of the jacket together.

12. A container for treating heated metal under pressure, comprising a cylinder, a winding of asbestos-covered wire upon the cylinder, the said wire being distributed as spaced coils, and an inclosing jacket.

811,197. COIN-TRAY. EDWARD J. BRANDT, Watertown, Wis., assignor to Brandt Cashier Company, Chicago, Ill., a Corporation of Illinois. Filed July 5, 1904. Serial No. 215,272.



Claim.—1. A coin-tray comprising a series of sections disposed side by side longitudinally of the tray, each of said sections containing a plurality of coin-cells disposed side by side transversely of the section, and means for separably and interchangeably uniting said sections laterally, substantially as described.

2. A coin-tray comprising a series of longitudinal sections each containing a plurality of coin-cells disposed side by side transversely of the section, and tie-rods passed transversely through the ends of said sections and uniting them laterally, substantially as described.

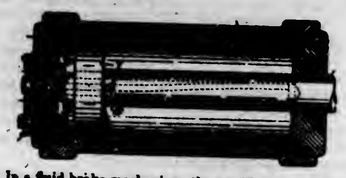
3. A coin-tray comprising a series of longitudinal sections each having a side and end walls and a plurality of coin-cells disposed side by side transversely of the section, a strip or bar constituting a side wall on one side of the tray, and means for separably uniting said sections and side wall laterally, substantially as described.

4. A coin-tray comprising a series of longitudinal sections for coins of different denominations, each of said sections having a side and end walls and a plurality of coin-cells disposed side by side transversely of the section, a strip or bar constituting a side wall on one side of the tray, and tie-rods passed transversely through the ends of said sections and uniting them laterally, substantially as described.

811,198. FLUID-BRAKE MECHANISM. BERNHARD T. BUSCHMANN, Brooklyn, N. Y. Filed Apr. 12, 1905. Serial No. 255,203.

Claim.—1. In a fluid-brake mechanism, the combination with a sliding throttling member having an aperture therein in open communication with the cylinder on one side of the piston, of a cylindrical throttling-stem having formed therein a channel partly parallel to the axis of the stem and partly helical arranged to coöperate with the

aperture to control the flow of fluid from one side of the piston to the other, substantially as described.



2. In a fluid-brake mechanism, the combination with a sliding throttling member having an aperture therein in open communication with the cylinder on one side of the piston, of a cylindrical throttling-stem having formed therein a channel partly parallel to the axis of the stem and partly helical arranged to coöperate with the aperture to control the flow of the fluid, and means connected with said stem and mounted on the outside of the brake mechanism for adjusting it with respect to the aperture, substantially as described.

3. In a fluid-brake mechanism, the combination with a cylinder, of a piston working therein a piston-rod secured to said piston said rod having a chamber formed therein and an aperture in the wall of the chamber in open communication with the cylinder on one side of the piston, and a cylindrical throttling-stem lying in said chamber and having formed therein a channel partly parallel to the axis of the stem and partly helical arranged to coöperate with the aperture to control the flow of fluid from one side of the piston to the other, substantially as described.

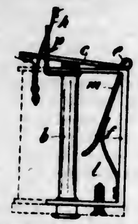
4. In a fluid-brake mechanism, the combination with a cylinder, of a piston working therein, a piston-rod secured to said piston said rod having a chamber formed therein and an aperture in the wall of the chamber in open communication with the cylinder on one side of the piston, a cylindrical throttling-stem lying in said chamber and having formed therein a channel partly parallel to the axis of the stem and partly helical arranged to coöperate with the aperture to control the flow of the fluid, and means connected with said stem and mounted on the outside of the brake mechanism for adjusting it with respect to the aperture, substantially as described.

811,199. HEATER. WILLIAM H. CALHOUN, Marshalltown, Iowa, and WILLIAM G. CALHOUN, Fargo, N. D., assignors of one-half to Edward H. Uhl, Chicago, Ill. Filed May 15, 1905. Serial No. 260,460.

Claim.—1. A heater, comprising a fire-pot, an inclosing wall forming a chamber receiving the gaseous products rising from the fuel, a central air-duct leading downwardly in said chamber into proximity to the fuel-bed, an open-bottomed drum surrounding said air-duct and provided with a series of openings near the induction end only of the air-duct and an exit-tube or smoke-pipe situated at one side of said drum and in free communication with said chamber at or near the upper part thereof.

2. A heater, comprising a fire-pot, an inclosing wall forming a chamber receiving the gaseous products rising from the fuel, a central air-dust leading downwardly in said chamber into proximity to the fuel-bed and having a tapered outlet, an open-bottomed drum surrounding said air-dust and provided with a series of openings near the induction end only of the air-dust and an exit-tube or smoke-pipe situated at one side of said drum and in free communication with said chamber at or near the upper part thereof.

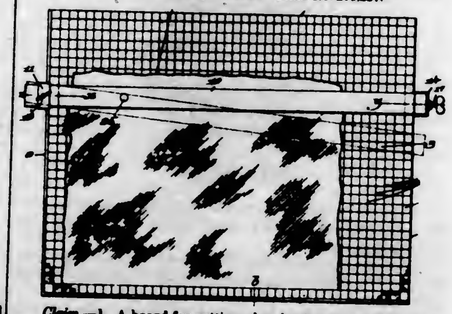
811,200. ELECTRIC LIGHTER AND EXTINGUISHER FOR GAS-BURNERS. ORESTE CARBI and CESAR CARBI, Genoa, Italy. Filed Nov. 17, 1904. Serial No. 233,174.



Claim.—1. In an apparatus of the class set forth, the combination with a gas-burner, and a tube extending from the lower end thereof and capable of being connected with the canalization, of a stationary electromagnet, arranged around said tube, a disk-like armature, hinged to the frame of the magnet, a downwardly-extending arm secured to the armature, a spring engaging with said arm for normally holding said armature in its raised position, an upwardly-extending arm of yielding material carried by said armature, a pawl arranged on the free end of said arm, a ratchet-wheel on the outer end of the plug of the burner-cock, capable of being engaged and rotated in one direction by said pawl when the same is moved downwardly, and means for preventing said ratchet-wheel from being rotated in opposite direction, substantially as set forth.

2. The combination with two sets of gas-burners, one having cocks of ordinary size, while the cocks of the other have passages of double width, tubular extensions on the lower end of each cock, of a stationary electromagnet arranged around each tube, a disk-like armature for each electromagnet, a central hole in the armature for allowing the same of being freely moved, a hinge connecting the armature to the magnet-frame, means for normally holding said armature in its raised position, an upwardly-extending arm carried by the armature, a pawl arranged on the free end of said arm, a ratchet-wheel on the outer ends of the plugs of the burner-cocks, capable of being engaged and rotated in one direction by said pawl when the same is moved downwardly, and means for preventing said ratchet-wheel from being rotated in opposite direction, substantially as set forth.

811,201. GLASS-CUTTING BOARD. EDWARD W. CHADWICK, Edgartown, Mass. Filed July 26, 1905. Serial No. 271,237.



Claim.—1. A board for cutting glass having on one side a gage which projects above the surface of the board, a straight-edge of a length to extend across the board, one end of said straight-edge being adapted to rest on the gage, means carried by the straight-edge to space the other end thereof from the board, and means to clamp said straight-edge to the board in any adjusted position.

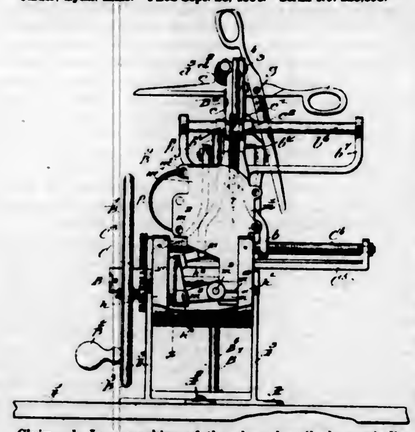
2. A board for cutting glass having on two adjacent sides a gage extending above the surface of the board, and against which the glass to be cut rests, a straight-edge resting at one end upon said gage, two clamping members on said straight-edge to clamp it to opposite edges of the board, one of the clamping members being constructed to space the adjacent end of the straight-edge above the board.

3. A board for cutting glass having a scale on the surface of the board adjacent one edge, a gage applied to the opposite edge of said board and extending above the surface of the same, the surface of

the gage having a scale applied thereto, a straight-edge resting at one end upon said gage, a clamping member secured to said end of the straight-edge, said clamping member having an adjustable foot to engage the adjacent edge of the board, and another clamping member secured to the opposite end of the gage and having a foot to engage the adjacent edge of the board, said latter clamping member having a shoulder to rest on the top of the board and thereby space from the board the end of the straight-edge to which it is secured.

4. A board for cutting glass having a scale on the surface of the board adjacent one edge, a gage applied to the opposite edge of said board and extending above the surface of the same, the surface of the gage having a scale applied thereto, a straight-edge resting at one end upon said gage, a clamping member secured to said end of the straight-edge, said clamping member having an adjustable foot to engage the adjacent edge of the board, and another clamping member adjustably secured to the opposite end of the gage and having a foot to engage the adjacent edge of the board, one of said feet having a rounding edge.

811,202. SHEARS OR SCISSORS GRINDING APPARATUS. EDWARD F. DAVIS, Lynn, Mass., assignor of one-fourth to Warren H. Calder, Lynn, Mass. Filed Sept. 26, 1904. Serial No. 226,896.



Claim.—1. In a machine of the class described, a grinding-wheel, a carriage having a shear-clamp mounted thereon, means for swinging the carriage toward and from the grinding-wheel, a screw-shaft engaging one end of said carriage, means for turning the screw-shaft in one direction, means for turning the screw-shaft in the opposite direction, and a swinging frame carrying said screw-shaft, whereby it may be swung into operative relation with either of said means.

2. In a machine of the class described, a carriage, shear-clamping means sustained thereby, a grinding-wheel, said carriage having a swinging movement to carry the shear-clamping means toward and from the grinding-wheel, devices for moving the clamp and carriage with relation to the grinding-wheel that the grinding-wheel may act from one to the other end of the shear-blade, and oppositely-acting means selectively engaging said devices to cause it to move the clamp and carriage in opposite directions.

3. In a machine of the character described, a grinding-stone, a carriage, a shear-clamp supported thereon, a screw for reciprocating said carriage and clamp to move the shear-blade across the edge of the grinding-stone and means for reciprocating said carriage, said means consisting of a main drive-shaft, a gear thereon, an intermediate gear or pinion mounted on the aforesaid screw and a reversing-gear mounted in the framing of the machine and means for engaging the intermediate gear with driving-gear or the reversing-gear.

4. In a machine of the character described, a grinding-stone, a carriage, an arm mounted on said carriage, a shear-clamp carried by said arm, a guide-rod, a screw and means for operating said screw to move the shear-blade across the face of the stone, said means consisting of a driving-gear, an intermediate pinion or gear mounted upon the screw, and a reversing-gear, said drive-gear and reversing-gear being continually in mesh, and means for selectively engaging the intermediate pinion with either the driving-gear or reversing-gear.

5. In a machine of the character described, a grinding-stone, a two-part carriage, an arm supported thereby, a clamp thereon, a screw for operating said two-part carriage, a swinging yoke carrying said screw, a set of gearing for imparting direct and reverse rotary motion to said screw, said set of gearing consisting of a driving-gear, a reversing-gear and an intermediate gear, said intermediate gear being mounted on the screw.

6. In a machine of the character described, a grinding-stone, a two-part carriage, an arm mounted thereon, a clamp supported thereby, a screw for operating the carriage, a set of gearing for imparting rotary motion in either direction to said screw, said set of gearing comprising a drive-gear, a reversing-gear, and an intermediate gear and spring-controlled means for throwing said intermediate gear into or out of mesh with either of the other gears.

7. In a machine of the character described, a grinding-stone, a two-part carriage, an arm mounted thereon, a clamp supported thereby, a screw for operating the carriage, a swinging yoke carrying said screw, a set of gearing for imparting rotary motion in either direction to said screw, said set of gearing comprising a drive-gear, a reversing-gear, and an intermediate gear, said intermediate gear being mounted on the said screw, said swinging yoke being mounted to turn about a center between the axis of rotation of the drive-gear and the axis of rotation of the reversing-gear, whereby in rocking the said yoke in one or the other directions, the intermediate gear will be brought into mesh with one or the other of the aforementioned gears.

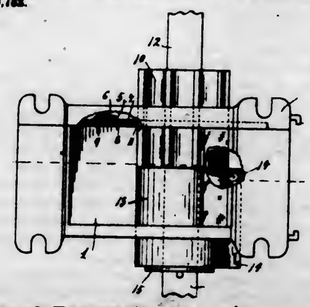
8. In a machine of the character described, a grinding-stone, a guide-rod, a two-part carriage mounted to slide on said guide-rod and means for reciprocating said two-part carriage, the two parts of said carriage being pivoted together in a sliding relation to each other.

9. In a machine of the character described, a grinding-stone, a guide-rod, a two-part carriage mounted to slide on said guide-rod and means for reciprocating said two-part carriage, the two parts of said carriage being pivoted togther in a sliding relation to each other, and a spring connected to said pivoted parts to counterbalance the weight of the shears or other article being ground.

10. In a machine of the class described, a grinding-wheel, a two-part carriage, a shear-clamp mounted thereon, a guide-rod for one end of said carriage, a screw-shaft engaging the other end of said carriage and provided with a pinion, a swinging frame carrying said screw-shaft, an oppositely-moving toothed wheel with either of which said pinion may be engaged to rotate said screw in one or the other direction.

11. In a machine of the class described, a two-part carriage, means to guide the same, means to slide the same, an arm engaging said carriage and provided with a shear-clamp and an adjustable spring to more or less counterbalance the weight of the shears held in the clamp.

811,208. FEEDING DEVICE FOR SEEDERS OR DRILLS. SPENCER B. DAVIS, Minneapolis, Minn. Filed Dec. 1, 1905. Serial No. 289,782.



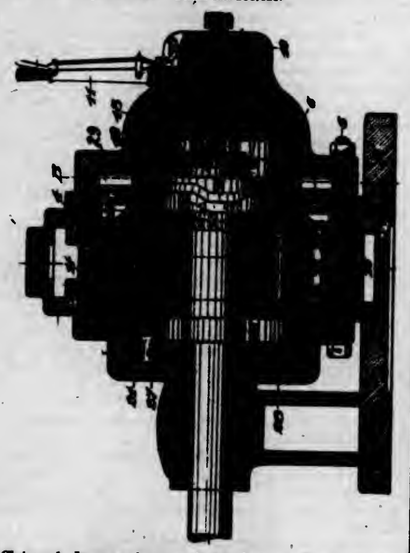
Claim.—1. The combination with a cup having a curved bottom extending to a discharge-opening, of a feed-ring working in one side of said cup and having in its inner face a plurality of concave pockets that extend to the face of said ring on curved lines and without angles or shoulders, a corrugated feed-hub mounted to slide through, but to rotate with said feed-ring, and a non-rotary hub having a cut-off gate or flange, coöperating with said feed-hub and feed-ring, substantially as described.

2. The combination with a cup having an approximately semi-cylindrical bottom extending to a discharge-opening, of a rotary feed-ring counterrunk in one side thereof with its periphery working

in a cast extending below the bottom of the cup, said feed-ring having in its inner face a plurality of radially-extended concave pockets formed on curved lines that join the face of said feed-ring without angles or shoulders, and the outer extremity of which pockets pass to the bottom of said cup, under a rotary motion of said feed-ring, substantially as described.

3. The combination with a cup having a curved bottom extending to a discharge-opening, of a feed-ring working in one side of said cup, said feed-ring having an approximately flat inner face formed with shallow depressed pockets, but smooth except for said pockets, a corrugated hub having a cut-off gate or flange cooperating with said feed-hub and feed-ring, the inner end of said gate or flange being adapted for close cooperation with the smooth inner-faced portion of said feed-ring, substantially as described.

811,204. **ROTARY ENGINE.** PHILIP J. DECKER, San Francisco, Cal. Filed Sept. 29, 1905. Serial No. 280,411.



Claim.—1. In an engine, a casing, a shaft, a rotary piston concentric with and of lesser diameter than the casing, abutments on one of said parts dividing the space between the casing and piston into a plurality of compartments, said compartments being provided with double sets of inlet and exhaust ports, a shiftable member having double sets of ports registerable with said inlet and exhaust ports whereby the direction of operation of the engine may be reversed, radially-movable vanes carried by the other part, and means for moving said vanes into and out of the path of said abutments.

2. In a rotary engine, a casing, a shaft, a rotary piston, said piston and casing inclosing an annular space, abutments on the casing dividing said space into a plurality of compartments, said compartments being provided with double sets of inlet and exhaust ports, a shiftable member operating in the compartments and having double sets of ports registerable with said inlet and exhaust ports whereby the direction of operation of the engine may be reversed, radial reciprocal vanes carried by the piston, and means for moving said vanes into and out of the path of said abutments.

3. In a rotary engine, a casing, a shaft, a rotary piston, said piston and casing inclosing an annular space, abutments on the casing dividing said space into a plurality of compartments, radially-reciprocal vanes carried by the piston, means for moving said vanes into and out of the path of said abutments, and means for admitting an impelling medium to and exhausting it from said compartments to operate the shaft in either direction, said means comprising a shiftable member having double sets of ports cooperating with double sets of inlet and exhaust ports in the ends of the compartments.

4. In an engine, a casing, a shaft, a rotary piston concentric with and of lesser diameter than the casing, abutments on one of said parts dividing the space between the casing and piston into a plurality of compartments, radially-movable vanes carried by the other part, means for moving said vanes into and out of the path of said abutments, and means for admitting an impelling medium to and exhausting it from said compartments to operate the shaft in either direction, said means comprising a shiftable member having double sets of ports cooperating with double sets of inlet and exhaust ports in the ends of the compartments.

5. In a rotary engine, a casing, a shaft, a rotary piston carried thereby, said piston and casing inclosing an annular space divided in the direction of the length of the shaft into a plurality of compartments, said compartments having double sets of inlet and exhaust ports radially-movable vanes carried by the piston, said vanes of lesser number than the number of said compartments, a fixed cam for operating said vanes, and means for admitting and exhausting an impelling medium to and from said compartments, said means including an axially-shiftable member having double sets of ports registerable with the said inlet and outlets of the compartments.

6. In a rotary engine, a casing, a shaft, a rotary piston carried thereby, said piston and casing inclosing an annular space divided in the direction of the length of the shaft into a plurality of compartments said compartments having double sets of inlet and exhaust ports, radially-movable vanes carried by the piston, said vanes of lesser number than the number of said compartments, a fixed cam for operating said vanes, and means for admitting and exhausting an impelling medium to and from said compartments to operate the shaft in either direction, said means including a shiftable member concentric with the shaft and provided with double sets of ports registerable with the said inlet and exhaust ports of the compartments.

7. In an engine, a casing, a shaft, a rotary piston, said piston and casing inclosing an annular space, and abutments extending parallel with the shaft and disposed tangential to the piston and dividing said space, said abutments being disposed at equal distances around the circumference of the casing, and each compartment of said casing having an exhaust-port at each end proximate to an abutment and communicating with said annular space, a radially-movable vane carried by the piston, and means for operating said vane to carry it into and out of the path of said abutments.

8. In an engine, a casing, a shaft, a rotary piston, said piston and casing inclosing an annular space, an abutment extending parallel with the shaft and disposed tangential to the piston and dividing said space, said abutments being disposed at equal distances around the circumference of the casing, and each compartment of said casing having an exhaust-port at each end proximate to an abutment and communicating with said annular space, a radially-movable vane carried by the piston, and means for operating said vane to carry it into and out of the path of said abutments, said last-named means including a stationary cam, and a rocker-arm carried by the piston and connected with the vane and engaging said cam

9. In an engine, a casing, a shaft, a rotary piston, said piston and casing inclosing an annular space, an abutment on the casing extending parallel with the shaft and exposed tangential to the piston and dividing said space, a radially-movable vane carried by the piston, means for operating said vane to carry it into and out of the path of said abutments, said casing having exhaust-ports and inlet-ports on both sides of said abutments, and means including a shiftable member with double sets of ports registerable with the said inlet and exhaust ports, for covering one set of said inlet and exhaust ports and correspondingly uncovering the other set.

10. In an engine, the combination of a casing, a shaft, a rotary piston thereon, said piston and casing inclosing an annular space divided into a plurality of compartments, radial vanes on the piston, means for retracting said vanes within the piston and for projecting said vanes outwardly into said compartments, said compartments provided with double sets of inlet and exhaust ports, a ring concentric with the casing and having ports registerable with said inlet and exhaust ports, and means for shifting said ring to cover one set of said inlet and exhaust ports and uncover another set.

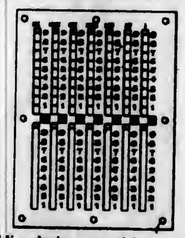
11. In an engine the combination of a casing, a shaft, a rotary piston thereon, said piston and casing inclosing an annular space divided into a plurality of compartments, vanes carried by the piston and operating in said compartments, said compartments having inlet-ports, valves controlling the admission of fluid through said ports, and means including a single shiftable cam on the shaft to operate said valves synchronously and to vary the time of operation of the valves.

12. In an engine the combination of a casing, a shaft, a piston thereon, said piston and casing inclosing a space divided in the direction of the length of the shaft into a plurality of compartments, vanes carried by the piston and operating in said compartments, said compartments having exhaust and inlet ports, valves in said inlet-ports, a cam on the shaft, and connections between the shiftable cam and valves to operate the latter synchronously and to vary the time of operation of the valves.

13. In an engine the combination of a casing, a shaft, a piston thereon, said piston and casing inclosing a space divided in the direction of the length of the shaft into a plurality of compartments, vanes carried by the piston and operating in said compartments, said compartments having exhaust and inlet ports, valves in said inlet-ports, a cam on the shaft, connections between the cam and valves to operate the latter synchronously, and means for shifting the position of the cam on the shaft to alter the time of operation of said valves.

14. In an engine the combination of a casing, a shaft, a piston thereon, said piston and casing inclosing a space divided in the direction of the length of the shaft into a plurality of compartments, vanes carried by the piston and operating in said compartments, said compartments having exhaust and inlet ports, valves in said inlet-ports, a cam on the shaft, connections between the cam and valves to operate the latter synchronously, said cam having a sliding movement lengthwise of the shaft and capable of a limited rotary movement independent thereof, means for effecting the reciprocation and oscillation of the cam, and means for locking it to the shaft.

811,205. **ADDING DEVICE.** EDWARD C. DILWORTH, Pittsburg, Pa. Filed Mar. 20, 1905. Serial No. 251,091.



Claim.—1. An adding device, comprising a frame provided with a series of guides and having its face provided with a series of openings extending across the same and two series of slots, and bearing numbers adjacent to each of said slots, and a series of slides bearing numbers mounted in said guides opposite said openings and provided with means accessible through both series of slots for the engagement of moving means, the numbers on said slides and those adjacent both series of slots all running consecutively in the same direction.

2. An adding device comprising a frame having a series of guides therein, slides substantially half the length of said guides carrying numbers adapted to be moved from one end to the other of said guides, and a front plate having two sets of slots formed therein at its opposite ends and having openings intermediate of said slots and numbers running parallel with said slots, the numbers on the slides and those adjacent the two sets of slots running consecutively in the same direction.

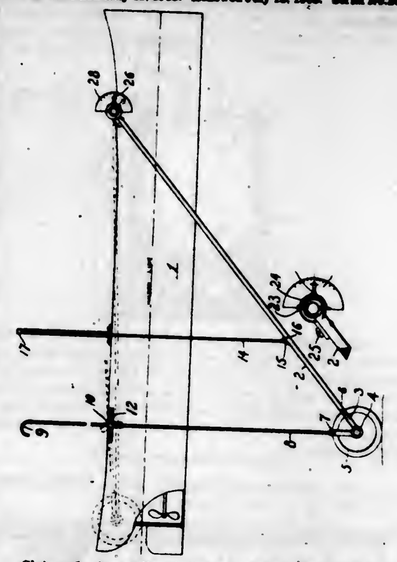
811,206. **CAR PART.** ETHAN I. DODDS, Avalon, Pa., assignor to Pressed Steel Car Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Feb. 23, 1904. Serial No. 194,041.

Claim.—1. A car part composed of a flanged metal piece slit in the web with longitudinal slits to afford a middle member and side members, said middle member and side members being bent away from each other in a direction transverse to the web, and the middle member being flanged; substantially as described.

2. A car part composed of a flanged metal piece slit in the web with longitudinal slits to afford a middle member and side members, said middle member and side members being bent away from each other in a direction transverse to the web, and the middle member being flanged with flanges deeper at the middle portion; substantially as described.

3. A car part composed of a flanged metal piece slit in the web with longitudinal slits to afford a middle member and side members, said middle member and side members being bent away from each other in a direction transverse to the web, and the side members being bent toward each other in the same plane; substantially as described.

811,207. **SOUNDING DEVICE.** SWINTON HALES, Washington, D. C. Filed May 13, 1903. Renewed July 15, 1905. Serial No. 269,606.



Claim.—1. A sounding device comprising a bar, a roller carried thereby, a graduated rod actuated by the movement of said roller, and a movable guide for said rod.

2. A sounding device comprising a bar, a roller carried thereby, a graduated rod actuated by the movement of said roller, a movable guide for said rod, and an indicator controlled by the movements of the other end of said bar.

3. A sounding device comprising a bar, a roller carried thereby, a pivot for one end of said bar, and a ball-and-socket connection between said pivot and bar.

4. A sounding device comprising a bar, a roller carried thereby, a pivot for one end of said bar, a ball-and-socket connection between said pivot and bar, a fixed dial, and a finger movable with said bar for cooperation with said dial.

5. A sounding device comprising a bar pivotally mounted at one end and carrying an index-finger, a dial cooperating with said finger, a roller carried by the other end of said bar, a graduated rod movable with said bar, and means for raising and lowering the same.

6. A sounding device comprising a bar pivotally mounted at one end and carrying an index-finger, a dial cooperating with said finger, a roller carried by the other end of said bar, a graduated rod movable with said bar, means for raising and lowering the same, and a swiveled guide for said rod.

7. A sounding device comprising a bar adapted to be pivotally mounted above the deck of a vessel, a contacting member carried thereby, a graduated rod rising from the free end of said bar and actuated by the movement of said member, and a swivel-guide for said rod.

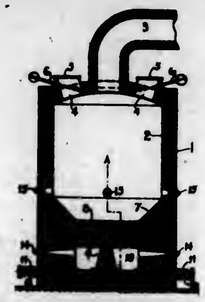
811,208. **GAS-PRODUCER.** CARLETON ELLIS, New York, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Mar. 15, 1905. Serial No. 250,178.

Claim.—1. In a dry-cooled gas-producer, the combination of a shell with closed lower end forming an ash-chamber, a screw conveyer for removing ash from the chamber, a baffle-wall spanning the shell above the chamber, and blast-tuyers piercing the sides of the shell and directed against the baffle-wall.

2. In a dry-cooled gas-producer, the combination of a shell with closed lower end forming an ash-chamber, a screw conveyer for removing ash from the chamber, an upwardly-tapering baffle-wall spanning the shell above the chamber, and blast-tuyers piercing the sides of the shell and directed against the baffle-wall.

3. In a dry-cooled gas-producer, the combination of a shell with closed lower end forming an ash-chamber, a partition across the chamber, subdividing it into compartments, a screw conveyer for removing the ash in each compartment, an upwardly-tapering baffle-

wall spanning the shell above the partition and supported thereby, and blast-tuyeres piercing the sides of the shell and directed against the baffle-wall.



4. In a dry-cooled gas-producer, the combination of a shell with a closed lower end forming an ash-chamber, a partition across the chamber, subdividing it into compartments, a screw conveyer for removing the ash in each compartment, an upwardly-tapering baffle-wall spanning the shell above the partition and placed at an angle thereto, and blast-tuyeres piercing the sides of the shell and directed against the baffle-wall.

811,209. KNOCKDOWN SUPPORT. JOHN H. FARRELL, Chicago, Ill. Filed Mar. 26, 1904. Serial No. 200,155.

Claim.—In a support, the combination with a top having a recess in its under side, a central stud in said recess, and a lug projecting from said stud, of a tubular standard adapted to engage said stud and having a slot in its upper end to receive said lug, and an external rotatable ring on said standard having vertical and horizontal slots adapted to engage said stud.

811,210. CUFF-HOLDER. HENRY C. FRANK, New York, N. Y. Filed Apr. 14, 1905. Serial No. 255,698.

Claim.—1. A cuff-holder comprising a shank having a shirt-sleeve-engaging clasp and a cuff-engaging hook, the said cuff-engaging hook being provided with a rounded retaining-lug struck but not separated from the body of the hook.

2. A cuff-holder comprising a shank having a shirt-sleeve-engaging clasp and a cuff-engaging hook, the said cuff-engaging hook being hinged to the shank and comprising an upwardly-extended portion, a laterally-extended portion and a downwardly-extended portion and a lug struck from the body of the hook at the outer end of its laterally-extended portion, said lug being formed without severing any portion of the same from the body of the hook.

811,211. AMUSEMENT-RAILWAY. ASHE B. W. FRAZER, Washington, D. C. Filed Mar. 21, 1903. Renewed July 15, 1905. Serial No. 269,908.

Claim.—1. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions separated by a slot, means for sustaining the pathway in vertical position, a clamp extending through the slot, and means connected to the clamp exterior to the pathway for causing the clamp to traverse the pathway; substantially as described.

2. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions so arranged as to leave a slot between contiguous parallel portions, a clamp extending through each slot, and means connected with the clamps exterior to the pathway for causing the clamps to traverse the pathway in opposite directions; substantially as described.

3. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions separated by a slot, means for sustaining the pathway in vertical position, a shoe adapted to traverse the exterior of the pathway, a clamp carried by the shoe and extending through the slot and means for causing the shoe to traverse the pathway; substantially as described.

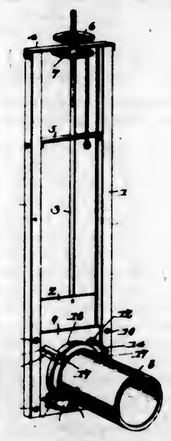
4. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions separated by a slot, means for sustaining the pathway in position comprising braces, one of which is hollow, a clamp extending through the slot, a cord or band connected with the clamp and extending through the hollow brace, and means acting on the cord or band to cause the clamp to traverse the periphery of the pathway; substantially as described.

5. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions separated by a slot, means for sustaining the pathway in position, comprising

braces, one of which is hollow, a clamp extending through the slot, a cord or band connected with the clamp and extending through the hollow brace; substantially as described.

6. In an amusement-railway, the combination of a circular vertically-arranged pathway, comprising parallel portions separated by a slot, means for sustaining the pathway in vertical position, a shoe adapted to traverse the exterior of the pathway, a clamp carried by the shoe and extending through the slot, a cord or band secured to the shoe near one end, extending around the exterior of the circular pathway and provided with means for detachably engaging the shoe near its other end; substantially as described.

811,212. WATER HEAD-GATE. FRANK D. GIBBINES, Fort Collins, Colo. Filed Feb. 23, 1905. Serial No. 246,991.



Claim.—1. In a water head-gate, a head-plate provided with integral lugs, wedges engaging the inner faces thereof, and means for securing the wedges in position.

2. In a water head-gate, a head-plate provided with integral reinforced lugs having flat inner faces, wedges engaging the said faces, and means for securing the wedges in position.

3. In a water head-gate, a head-plate provided with integral lugs, bolts projecting through the plate and disposed parallel with the inner sides of the lugs, wedges mounted upon the bolts, and clamping-nuts carried by the bolts and engaging the wedges.

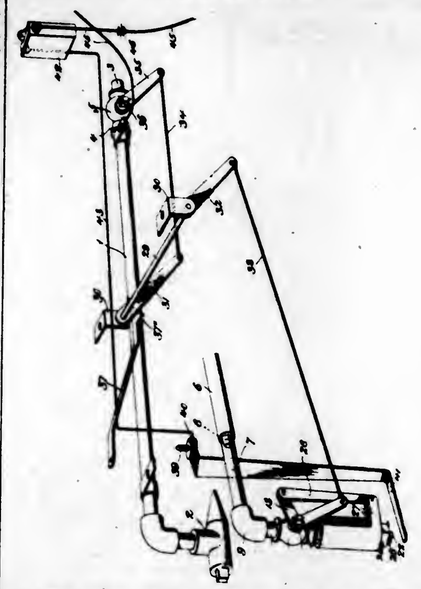
4. In a water head-gate, a head-plate provided with integral lugs, bolts projecting through the head-plate and extending parallel with the inner faces of the lugs, wedges engaging the bolts having their inner faces beveled or curved, and nuts carried by the bolts and engaging the wedges.

811,213. LOW-WATER ALARM FOR STEAM-BOILERS. CHRISTOPHER G. GILBARD, Swansea, Mass. Filed Nov. 10, 1904. Serial No. 232,104.

Claim.—1. The combination with a steam-boiler and its burner, of a fusible-plug pipe, a main liquid-fuel-supply pipe having a valve or cut-off, means adapted to be actuated by the steam-pressure within the fusible-plug pipe for operating or closing the valve of the fuel-supply pipe, and an automatic locking device for said valve when the same is operated or thrown to a closed position.

2. The combination with a steam-boiler and its burner, of a fusible-plug pipe, an extension coupled thereto, a sliding sleeve mounted on the extension, a main liquid-fuel-supply pipe, a valve or cut-off therein, a rock-arm extending from the stem of the valve, an intermediate rock-shaft, a pair of rock-arms extending from the shaft, a rod connecting one of said rock-arms with the rock-arm of the valve, means for actuating the second rock-arm by the movement of the sleeve, and a latch arranged in the path of one of said rock-arms and adapted to engage the same when the valve in the fuel-supply pipe is closed and the sleeve actuated.

3. The combination with a steam-boiler and its burner, of a fusible-plug pipe, an extension coupled thereto, a sliding sleeve mounted on the extension, a main liquid-fuel-supply pipe, a valve or cut-off therein, a rock-arm extending from the stem of the valve, an intermediate rock-shaft, a pair of rock-arms extending from the shaft, a rod connecting one of said rock-arms with the rock-arm of the valve, means for actuating the second rock-arm by the movement of the sleeve, and a locking device adapted to engage and lock one of said rock-arms when the fuel-supply pipe is closed.



4. The combination with a steam-boiler and its burner; of a fusible-plug pipe, an extension connected to the same and terminating at its lower end in an enlarged head, a sleeve mounted to reciprocate upon the extension and depending below the head, a coiled spring interposed between the head and upper end of the sleeve and adapted to normally elevate the latter, a valve at the lower end of the sleeve, a spring for normally elevating the same from its seat, a fuel-supply pipe, a cut-off therein, and means actuated by the movement of the sleeve for operating said cut-off.

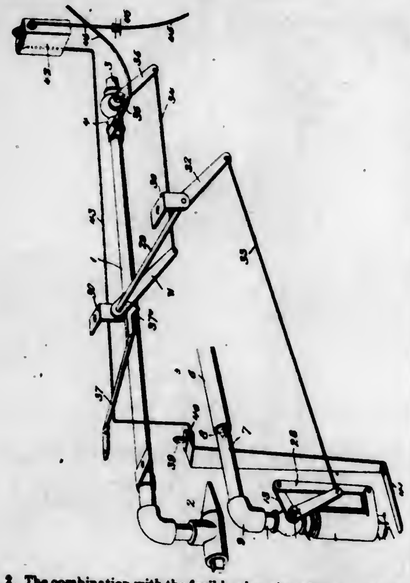
5. The combination with a steam-boiler and its burner, of a fusible-plug pipe connected to the boiler, a sliding element mounted for reciprocal movement upon and inclosing the fusible-plug pipe, a fuel-supply, a cut-off therein, and means operated by the reciprocal movement of said sliding element for operating the cut-off.

6. The combination with a steam-boiler and its burner, of a fusible-plug pipe, an extension-pipe coupled thereto and terminating at its lower end in a head, a sliding sleeve mounted on the extension above the head, a coiled spring inserted between the sleeve and the head, a bored cap in the lower end of the sleeve, a stem mounted in the bore and having at its upper end an angular head and below the same a valve for closing the bore, a spring for normally elevating the head, a bell-crank lever mounted on the extension-pipe, arms projecting from the sleeve, a connecting-rod between one branch of the bell-crank and said arms, a main fuel-supply pipe, a valve therein, an intermediate rock-shaft, rock-arms depending therefrom, a connection between one of said rock-arms and a rock-arm carried by the valve of the fuel-supply pipe, and a connection between the remaining rock-arm and the said bell-crank lever.

7. The combination with a steam-boiler and its burner, of a fusible-plug pipe terminating in a step or head, a sliding sleeve mounted on the fusible-plug pipe, a spring for normally pressing the sleeve in a direction contrary to that of the flow of steam when the plug in the fusible-plug pipe is fused, a fuel-supply pipe, a cut-off therein, and means actuated by the sleeve when operated against the tension of its spring for operating the cut-off of the fuel-supply pipe.

811,214. LOW-WATER ALARM FOR STEAM-BOILERS. CHRISTOPHER G. GILBARD, Swansea, Mass. Original application filed Nov. 10, 1904. Serial No. 232,104. Divided and this application filed Jan. 12, 1905. Serial No. 240,894.

Claim.—1. The combination with the fusible-plug pipe of a steam-boiler, of an electrical contact adapted to be actuated by the pressure of steam escaping from said fusible-plug pipe, a second contact arranged in the path of the first, a source of electrical energy, conductors leading to such contact, and an alarm located in the electrical circuit.



2. The combination with the fusible-plug pipe of a steam-boiler, of an electric contact adapted to be actuated by the pressure of steam escaping from said pipe, a second contact arranged in the path of the first, a source of electric energy, conductors leading to each contact, and an alarm located in the electric circuit, a cut-off arranged in the path of and connected to the fusible-plug pipe, and means actuated by the movable contact for operating said cut-off.

3. The combination with the fusible-plug pipe of a steam-boiler, of a pipe connected to the outer end thereof, a sliding sleeve mounted on said extension, a contact arranged in the path of the sleeve, conductors connected with said contact and with said sleeve, a source of electric energy, and an alarm arranged in the circuit.

4. The combination with the fusible-plug pipe of a steam-boiler, of an extension coupled thereto, a valve located in the extension, a sleeve mounted on the extension beyond the valve, a contact arranged in the path of the sleeve, electric conductors leading to the contact and to the sleeve, a spring for normally supporting the sleeve, means connected with the sleeve and with the valve whereby the latter is operated by the movement of the sleeve against the tension of the spring, a source of electric energy, and an alarm arranged in the circuit.

5. The combination with the fusible-plug pipe of a steam-boiler, of an alarm adapted to be actuated by the escape of steam therefrom, and a valve adapted to be actuated upon the escape of such steam and to close said plug-pipe.

6. The combination with the fusible-plug pipe of a steam-boiler, of an extension coupled thereto, a sliding sleeve mounted on the extension, a contact arranged in the path of the sleeve, an electric circuit connected to the sleeve and contact, and an alarm in said circuit.

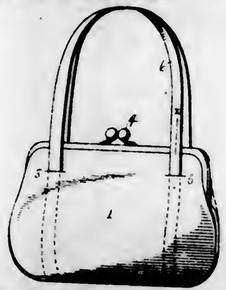
7. The combination with the fusible-plug pipe of a steam-boiler, of an extension coupled to the same and terminating at its lower end in a head, a sleeve mounted to reciprocate on the extension and depending below the head, a coiled spring interposed between the end of the sleeve and the head, a plug or cap in the lower end of the sleeve and provided with an opening, a valve-stem arranged in the opening and adapted to close the same a spring for normally elevating the valve-stem, a contact arranged in the path of the valve-stem, a source of electric supply, an alarm, and conductors leading from the electric supply and alarm to the contact and to the sleeve.

8. The combination with the fusible-plug pipe of a steam-boiler, of an alarm, an electrical circuit, and means actuated by the escape of steam from the fusible-plug pipe for closing the electrical circuit and sounding an alarm.

9. The combination with the fusible-plug pipe of a steam-boiler, of an extension thereof, a valve located in the extension and adapted to be closed by the escape of steam from the fusible-plug pipe, an electric contact carried by the extension and adapted to be actuated by the escape of steam from the fusible-plug pipe, a contact-arm, an electric circuit to the latter, and an alarm arranged in the circuit.

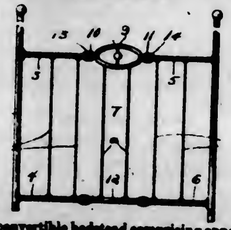
10. The combination with the fusible-plug pipe of a steam-boiler, of an extension-pipe coupled thereto and terminating at its lower end in a head and provided above the same with a valve having a stem extending outward therefrom, a sliding sleeve mounted on the extension above the head, a coiled spring inserted between the sleeve and the head, a bored cap in the lower end of the sleeve, a stem 22 mounted in the bore and having at its upper end an angular head 23 and below the same a valve 47 for closing the bore, a spring for normally elevating the head 23, a contact-arm arranged in the path of the stem 23, an electric circuit connected to said contact-arm and the sleeve, an alarm arranged in the circuit.

811,215. **BAG-HANDLE.** MAURICE GOLDSMITH, New York, N. Y. Filed Jan. 10, 1905. Serial No. 240,699.



Claim.—A bag comprising a frame, an outer cover having openings therein near the ends thereof, and an inner lining, a handle formed of a band or loop passing through the openings and vertically around the bag between the cover and lining, and free to slide therein whereby the band or loop may be used either as a short, double handle or interlocked and used as a long single handle, substantially as described.

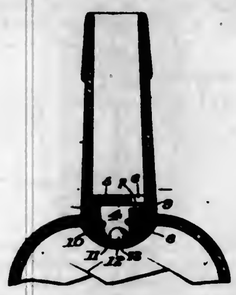
811,216. **EXTENSION-BED.** JOSEPH H. HARDEN, Nathan, Mich. Filed June 21, 1905. Serial No. 266,202.



Claim.—A convertible bedstead comprising oppositely-disposed posts, upper and lower rods connected to each post, said rods having their extremities screw-threaded, a section having a horizontal bar at its lower end screw-threaded at its extremities, and a loop member at its upper end, provided with screw-threaded projections at its ends, the horizontal bar of the said section being adapted for alinement with the lower short rods of the respective posts and the said projections being arranged for alinement with the upper rods of the respective posts, collars arranged for screw-threaded engagement with the upper horizontal rods and the corresponding projections of the said loop of said section, and collars arranged for screw-threaded engagement with the lower horizontal rods of the respective posts and the horizontal rod of said section, whereby the latter may be disconnected from the head and foot of the bedstead.

811,217. **NON-REFILLABLE BOTTLE.** BENJAMIN F. HARRIS, Philadelphia, Pa. Filed June 12, 1905. Serial No. 265,041.

Claim.—1. In a non-refillable bottle, an inwardly-extending shoulder in the bottle in the neck thereof, the same having a chamber therein, a valve in said chamber and a horizontally-extending diaphragm at the top of said shoulder, said diaphragm having a port therein and a portion of the top of said shoulder being cut away forming a horizontally-extending channel below said port.



2. In a non-refillable bottle, an inwardly-extending shoulder in the bottle in the neck thereof, the same having a chamber, a valve in said chamber, a horizontally-extending diaphragm at the top of said shoulder, said diaphragm having a port therein, a portion of the top of said shoulder being cut away forming a horizontally-extending channel below said port, said diaphragm and shoulder being integral with each other and with the adjacent portion of the bottle.

3. In a non-refillable bottle, an inwardly-extending shoulder in the bottle at the base of the neck and top of the body, forming a valve-chamber, a valve therein, a diaphragm extending horizontally from the top of said shoulder and joining the latter, said diaphragm having a port therein adjacent to the neck, and a cut-away portion on the top of said shoulder below said port, forming a horizontal channel whose height is less than that of the diameter of said valve.

4. In a non-refillable bottle, an inwardly-extending shoulder in the bottle at the base of the neck and top of the bottle, forming a valve-chamber, a valve therein, a diaphragm at the top of said shoulder and joining the latter, said diaphragm having a port therein adjacent to the neck, and a cut-away portion on the top of said shoulder below said port, forming a horizontal channel whose height is less than that of the diameter of said valve, said diaphragm and shoulder being integral with the adjacent portions of the bottle.

5. In a non-refillable bottle, a diaphragm in the neck thereof, the same having a port in one side thereof, an inturned shoulder below said diaphragm, the latter being connected with the top of said shoulder, a horizontally-extending channel existing between a portion of the top of said shoulder and said port, said shoulder having within the same a chamber and a valve-seat at the base thereof and a valve on said seat.

6. In a non-refillable bottle, a diaphragm in the neck thereof, the same having a port in one side thereof, an inturned shoulder below said diaphragm, the latter being connected with the top of said shoulder, a horizontally-extending channel existing between a portion of the top of said shoulder and said port, said shoulder having within the same a chamber and a valve-seat at the base of said chamber and a valve on said seat, said diaphragm and shoulder being integral with the adjacent portions of the bottle.

811,218. **WINDMILL.** BENJAMIN R. HARRINGTON, Phœnix, Ariz. Filed Apr. 6, 1905. Serial No. 254,120.

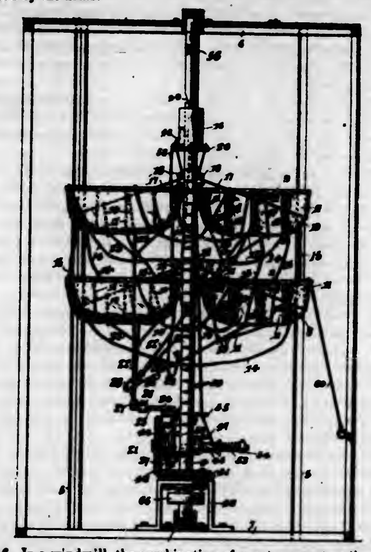
Claim.—1. In a windmill, the combination of a rotary mast, and a collapsible sail constructed of flexible material and provided with a plurality of pockets, each pocket being open at the front and closed at the top, bottom, sides and back.

2. In a windmill, the combination of a rotary mast, and collapsible sails open at the front and closed at the top, bottom, sides and back and provided with partitions forming separate pockets.

3. In a windmill, the combination of a rotary mast, and collapsible sails open at the front and closed at the top, bottom, sides and back and provided with vertical partitions forming a horizontal series of separate pockets.

4. In a windmill, the combination of a rotary mast, a pair of sail-supporting arms having parallel outer portions and angularly-disposed inner portions diverging from the mast, and a sail supported by the said arms.

5. In a windmill, the combination of a rotary mast, opposite horizontal arms arranged in pairs and consisting of rods piercing and centrally secured to the rotary mast, said rods being centrally crossed and angularly bent at opposite sides of the mast to provide inner diverging portions and outer parallel portions, and sails supported by the arms.



6. In a windmill, the combination of a rotary mast, collapsible sails, a slidable member mounted on the mast and located above the sails, flexible means extending upward, connecting the sails with the slidable member, a governor connected with and operated by the sails, and means operable by the governor for moving the slidable member to collapse the sails.

7. In a windmill, the combination of a rotary mast, collapsible sails, a slidable member mounted on the mast and located above the sails, flexible means extending upward, connecting the sails with the slidable member, a governor connected with and operated by the sails, means operable by the governor for moving the slidable member to collapse the sails, and automatic means for locking the slidable member to hold the sails collapsed.

8. In a windmill, the combination of a rotary mast, sails having collapsible pockets, a governor connected with and operated by the sails, and means operated by the governor for collapsing the pockets of the sails.

9. In a windmill, the combination of a rotary mast, sails having collapsible pockets, a governor connected with and operated by the sails, and means operated by the governor for collapsing the pockets of the sails, said means embodying a rotary drum and a flexible connection arranged to be mounted on the drum.

10. In a windmill, the combination of a rotary mast, sails having collapsible pockets, a governor connected with and operated by the sails, and means operated by the governor for collapsing the sails, said means involving a yieldably-mounted drum and a flexible connection arranged to be wound up by the drum.

11. In a windmill, the combination of a rotary mast, collapsible sails, a governor connected with and operated by the sails, and means operated by the governor for collapsing the sails, said means embodying a rotary drum, a flexible connection arranged to be wound up by the drum, and an actuating member frictionally engaging the drum.

12. In a windmill, the combination of a rotary mast, collapsible sails, a governor connected with and operated by the sails, and means operated by the governor for collapsing the sails, said means embodying a rotary drum, a flexible connection arranged to be wound up by the drum, an actuating member frictionally engaging one end of the drum, and a spring yieldably engaging the other end of the drum.

13. In a windmill, the combination of a rotary mast, collapsible sails, a governor connected with the sails, and embodying a fixed horizontal gear, a horizontal shaft carried by the rotary mast, a ver-

tool gear adapted to revolve around the fixed gear, and slidable means for operatively connecting the horizontal shaft with the gearing, and means actuated by the governor for collapsing the sails.

14. In a windmill, the combination of a rotary mast, collapsible sails, and a governor embodying a fixed horizontal gear, a horizontal shaft, a vertical gear adapted to revolve around the fixed gear and mounted on the horizontal shaft, slidable means for operatively connecting the horizontal shaft with the gearing, a weighted lever for actuating the slidable means, said weighted lever being connected with the sails and operated by the same, and means actuated by the governor for collapsing the sails.

15. In a windmill, the combination of a rotary mast, collapsible sails, a governor embodying a fixed horizontal gear, a vertical gear carried by the rotary mast, sail-collapsing mechanism, and a clutch for connecting the latter with the gearing.

16. In a windmill, the combination of a rotary mast, collapsible sails, a fixed horizontal gear, a horizontal shaft mounted on the rotary mast, a vertical gear meshing with the horizontal gear and adapted to revolve around the same, a sliding clutch element for interlocking the shaft with the vertical gear, a weighted lever connected with the sliding clutch element and with the sails and operated by the former, and mechanism actuated by the horizontal shaft for collapsing the sails.

17. In a windmill, the combination of a rotary mast, a horizontal shaft, gearing for actuating the same, said gearing embodying a fixed horizontal gear, a lever fulcrumed on the mast and having a weighted arm connected with the sails, means actuated by the lever for operatively connecting the horizontal shaft with the gearing, a drum actuated by the horizontal shaft, and flexible means adapted to be wound up on the drum and connected with the sails for collapsing the same.

18. The combination of a windmill having a sail for actuating it, said sail being movable, and governing mechanism for controlling the operation of the windmill, said governing mechanism being connected with and thrown into and out of operation by the sail.

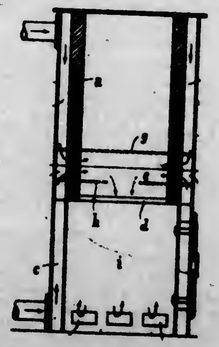
19. The combination of a windmill having a sail for actuating it, and governing mechanism for controlling the operation of the windmill, said governing mechanism being connected with and operated solely by the sail.

20. The combination of a windmill having a movably-mounted sail, a governor connected with and operated solely by the sail, and independent means controlled by the governor for throwing the windmill out of operation.

21. The combination of a windmill having a movably-mounted sail, a governor connected with and operated solely by the sail, and independent means controlled by the governor and connected with the sail for arranging the latter in an operative position.

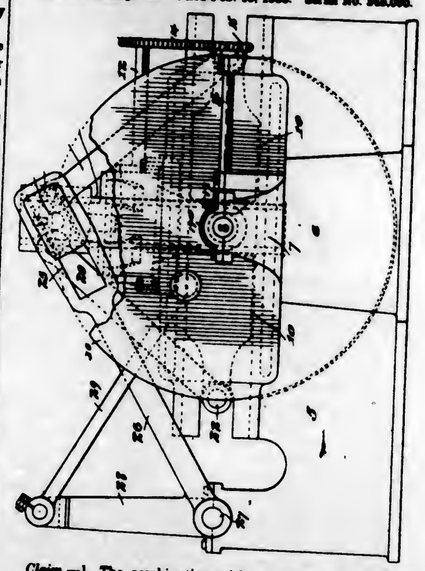
22. In a windmill, the combination of a rotary mast provided with supports, collapsible sails depending from the supports, governing mechanism for controlling the operation of the windmill, and means connected with the lower portions of the sails and with the governing mechanism for throwing the latter into and out of operation.

811,219. CRUCIBLE-FURNACE. ERNST HAUSMANN, Cologne, Germany. Filed Aug. 19, 1905. Serial No. 274,961.



Claim.—A crucible-furnace having air-feed passages formed in the walls thereof, said passages having inlet-openings at the lower and upper ends thereof, a lateral passage situated at a point a short distance above the plane of the grate and connected to the feed-passages, means for retarding the air in said lateral passage and passages for conducting the air from the lateral passage to beneath the grate, substantially as described.

811,220. MULTIPLE-PISTON EXPLOSIVE-ENGINE. CHARLES T. HILBERMANN, Chicago, Ill., assignor of one-half to Everett W. Brooks, Chicago, Ill. Filed Feb. 10, 1905. Serial No. 245,695.



Claim.—1. The combination with an engine-cylinder having oppositely-moving twin pistons, of a driven shaft disposed laterally of the cylinder and at right angles thereto, a vertical guide mounted on one side of the cylinder, a cross-head reciprocable over said guide, pitmen connecting the outer ends of the pistons with said cross-head, and driving connections between the latter and said driven shaft, substantially as described.

2. The combination with an engine-cylinder having oppositely-moving twin pistons, of a driven shaft disposed laterally of the cylinder and at right angles thereto, a vertical guide mounted on one side of the cylinder, a cross-head reciprocable over said guide, pitmen connecting the outer ends of the pistons with said cross-head, a bell-crank lever pivotally mounted opposite one end of said cylinder and having one arm thereof connected to said cross-head, a fly-wheel on said driven shaft, and a pitman connecting said fly-wheel to the other arm of said bell-crank, substantially as described.

3. The combination with an engine-cylinder having oppositely-moving twin pistons, of a driven shaft disposed laterally of the cylinder and at right angles thereto, a pair of vertical guides mounted on either side of the cylinder, respectively, cross-heads reciprocable over said guides, pitmen connecting the outer ends of the pistons with said cross-heads, a rock-shaft mounted transversely of and opposite one end of said cylinder, arms fast at one end on said rock-shaft and at their other ends engaged by said cross-heads, an upwardly-extending arm fast at its lower end on said rock-shaft, a fly-wheel on said driven shaft, and a pitman connecting said fly-wheel with the upper end of said upright shaft, substantially as described.

811,221. AUTOMATICALLY-OPERATING FIRE-EXTINGUISHER. HENRY W. HILDEBRAND, Denver, Colo. Filed June 21, 1905. Serial No. 266,269.

Claim.—1. In a fire-extinguisher, a main receptacle containing a supply of solution, a stepped top portion to said main receptacle, a cap secured to said stepped top portion, a cylinder in said main receptacle, to near the bottom of said main receptacle and adapted to divide said main receptacle into two compartments, a connecting-space between said two compartments below the lower edge of said cylinder, and the bottom of said receptacle, a circumferential row of apertures in said stepped top portion of said receptacle, leading into the space in said receptacle separated from the main body by said cylinder, a small receptacle in said main receptacle containing a supply of acid, proportionate to the amount of solution in said main receptacle, an acid-outlet in said small receptacle, and an acid-distributer in the outlet of said small receptacle, as set forth.

2. In a fire-extinguisher, a main receptacle containing a supply of solution, a stepped top portion to said main receptacle, a cap secured to said stepped top portion, a cylinder in said main receptacle, to near the bottom of said main receptacle and adapted to divide said main receptacle into two compartments, a connecting-space between said two compartments below the lower edge of said cylinder, and the bottom of said receptacle, a circumferential row of apertures in said stepped top portion of said receptacle, leading into the space in said receptacle separated from the main body by said cylinder, a small receptacle in said main receptacle containing a supply of acid, proportionate to the amount of solution in said main receptacle, an acid-outlet in said small receptacle, and an acid-distributer in the outlet of said small receptacle, as set forth.

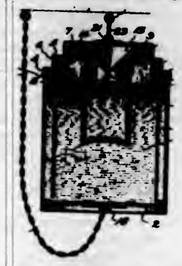
3. In a fire-extinguisher, a main receptacle, provided with a circumferential portion extending from its top portion to near its bottom portion, and adapted to divide its interior into two connecting-compartments, a supply of solution in said receptacle, a plurality of perforations in the top of said receptacle leading into the outer compartment, a cap secured to the top of said main receptacle, a cone depending from the bottom of said cap, a small receptacle secured to said cone, and depending into the central portion of said main receptacle, and containing a supply of acid, and an outlet-aperture in said small receptacle surrounding said cone, as set forth.

4. In a fire-extinguisher, a main receptacle, provided with a circumferential portion extending from its top portion to near its bottom portion, and adapted to divide its interior into two connecting-compartments, a supply of solution in said receptacle, a plurality of perforations in the top of said receptacle leading into the outer compartment, a cap secured to the top of said main receptacle, a cone depending from the bottom of said cap, a small receptacle secured to said cone, and depending into the central portion of said main receptacle, and containing a supply of acid, an outlet-aperture in said small receptacle surrounding said cone, an eye secured to the top of said can, a fusible hook secured to said eye and arranged and adapted to be hung and to depend said fire-extinguisher from or in proximity to a ceiling, and a chain or cord secured at one end to the bottom of said receptacle, and at its opposite end to or adjacent to a ceiling, as set forth.

5. In a fire-extinguisher, a main receptacle, having a stepped top portion, a cap secured to said top portion, a fusible hook connected to said cap, an eye or hook attached to or adjacent to a ceiling to which said fusible hook is adapted to be attached, whereby said receptacle is suspended from or adjacent to a ceiling, and a cord or chain secured at one end to the bottom of said receptacle, having its opposite end secured to or adjacent to a ceiling, and adjacent to said fusible hook, as set forth.

6. In a fire-extinguisher, a main receptacle, divided into two concentrically-arranged compartments, connected together at the bottom portion of the receptacle, and containing a supply of solution, a plurality of discharge-apertures in said receptacle, entering the outer concentric compartment, and arranged to be normally sealed, a small receptacle depending in the center of said main receptacle, an outlet in the top of said receptacle, a supply of acid in said small receptacle, a fusible hook connected to the top of said main receptacle, and adapted to suspend said main receptacle, in proximity to a ceiling, and a chain secured at one end to the bottom of said main receptacle and in proximity to a ceiling at its opposite end close to said fusible hook, and adapted to hold said main receptacle in an inverted position when said fusible hook melts, and mix said acid and solution together in said main receptacle, as set forth.

apertures in said stepped top portion of said receptacle, leading into the space in said receptacle separated from the main body by said cylinder, a small receptacle in said main receptacle containing a supply of acid, proportionate to the amount of solution in said main receptacle, and an acid-outlet in said small receptacle, as set forth.



7. In a fire-extinguisher, the combination of a solution-holding receptacle or can divided into two concentric compartments, by a cylindrical partition, extending from its top to close to its bottom, and containing a connecting annular space below the edge of said cylindrical partition, a stepped top to said receptacle, containing a circumferential row of apertures entering the outer compartment of said receptacle, a cap secured to the top of said receptacle, a small acid-holding receptacle or bottle in said main receptacle depending from said cap and provided with a discharge-aperture positioned above said supply of solution in said main receptacle, a conical acid spreader or distributer extending loosely into said acid-discharge aperture, a fusible hook connected to the top of said main receptacle or can, an eye connected to said hook and adapted to be connected to a ceiling, and adapted to depend said main receptacle below a ceiling of a room in an upright position, a chain secured at one end to the bottom of said main receptacle, and to a ceiling, at its opposite end, in proximity to said fusible hook, and adapted to depend said main receptacle in an inverted position when said fusible hook melts, as set forth.

8. In a fire-extinguisher, the combination of a can having a stepped top portion, containing a mouth, a cap threaded to the mouth, and a cylindrical partition in said can adapted to divide it into two compartments, and a circumferential row of discharge-perforations extending through one of the steps of said top portion and provided with an automatically-removing seal, adapted to normally keep them sealed, when can is in position of disuse.

9. In a fire-extinguisher, the combination of the solution-holding can, having the stepped perforated top, the cap, the two compartments connected at the bottom of said can, with the small acid-holding bottle in said can having a discharge-outlet, the conical acid-distributer extending into the discharge-aperture of said acid-holding bottle, means, including a fusible hook secured to the top of said can, adapted for suspending said can from a ceiling, and means, including a cord or chain attached at one end to the bottom of said can, for holding said can from a ceiling in a depending position, as set forth.

10. In a fire-extinguisher, the combination of the can provided with a supply of solution, and containing two compartments connected together at the bottom of the can, the circumferential row of discharge-apertures in said can, and the washer-seal over said apertures, with the cap threaded to the top of said can, the conical distributer connected to the bottom of said cap, the depending arms secured to said conical distributer, the threaded cap-supported aperture surrounded with an annular space all around said conical distributer, the bottle provided with a supply of acid arranged to screw into said cap, the fusible hook connected to the top of said can, means for connecting said fusible hook to a ceiling, the chain connected at one end to the bottom of said can, and means for connecting the opposite end of said chain to a ceiling adjacent to said fusible hook, as set forth.

11. In a fire-extinguisher, the combination of the solution-holding can having a removable cap, and normally sealed discharge-apertures, with a conical acid-distributer depending apex downward from said cap, a plurality of arms secured to said conical distributer, a threaded cap supported by said arms, a discharge-aperture surrounding said conical acid-distributer and adapted to form a discharge-space of predetermined area around said conical distributer above the level of the solution in said can, discharge-spaces between said arms, and a bottle provided with a supply of acid threaded to said cap, a fusible hook connected to the top of said can, means for securing said fusible hook to a ceiling to depend said can therefrom in an upright position, a chain or cord secured at one end to the bottom of said can, and means for securing the opposite end of said chain or cord to a ceiling to stop and hold said can in an inverted position when said fusible hook melts, and it drops from the ceiling, as set forth.

12. In a fire-extinguisher, the combination of a series of fire-extinguishers, comprising a receptacle having two concentric compartments, connected at the bottom with each other, and holding a supply of solution and having a normally sealed plurality of apertures through said can into the outer compartment, and an acid-holding receptacle in said receptacle, adapted to discharge its acid contents into the solution of said receptacle when said receptacle is turned into an inverted position, a fusible hook to each fire-extinguishing receptacle, a chain secured at one end to each fire-extinguishing receptacle, a pulley in said ceiling, arranged to support the opposite end of said chain, a cord attached to the opposite end of each chain of each fire-extinguisher, and a spring-bolt secured to the ceiling and connected at one end to said cord and having the fusible hook of each fire-extinguisher receptacle in the system hooked over its operative bolt end, as set forth.

13. In a fire-extinguisher, the combination of an automatic-operating fire-extinguishing system adapted to be secured below or in the ceiling-joists of rooms, comprising a plurality of main receptacles, each containing two compartments connected at the bottom of said receptacle, and containing a supply of solution, a small receptacle in each main receptacle, containing a supply of acid, and having a discharge-outlet above the solution of said main receptacle, a spring-bolt secured in juxtaposition to a ceiling at each point a fire-extinguishing receptacle is to be placed, a fusible hook secured to the upper end of said fire-extinguishing receptacle adapted to be hooked over the locking end of said spring-bolt, a chain secured at one end to each fire-extinguishing receptacle in the series, a pulley secured in juxtaposition to a ceiling for supporting the opposite end portions of said chain, and a cord secured to the pulley end of said chain of each fire-extinguishing receptacle at one end and at its opposite end secured to the rear end of said spring-bolt, as set forth.

14. In a fire-extinguisher, the combination of a plurality of the fire-extinguishing receptacles, and their fusible hooks, and tilting chains, arranged in any desired system below or between the ceiling-joists of rooms, and means, including a spring-bolt, for operatively precipitating all of said receptacles in successive order when the fusible hook of any one receptacle is melted, as set forth.

15. In a fire-extinguishing system, a plurality of cans, each containing normally sealed discharge-apertures when in an upright position, and containing a supply of solution, a bottle in each of said cans, containing a supply of acid, said bottle containing a discharge-aperture positioned above said solution when said can is in an upright position, a fusible hook at the top of each of said cans, in said system, means for operatively positioning said fusible hooks and cans in close proximity to a ceiling, and means, including a spring-operated bolt, for operatively precipitating the cans of the system in successive order, when the fusible hook of any one of the cans in the system is melted, and means for limiting the precipitative movement of said cans, as set forth.

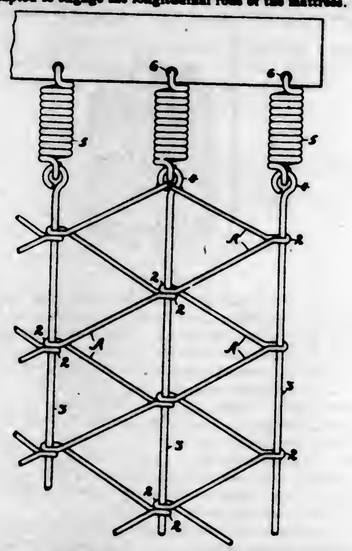
16. In a fire-extinguisher, the combination of a plurality of the fire-extinguishing cans housed between the ceiling-joists of a room, trap-doors in the bottom of said housing, a spring-bolt pivotally secured in said housing to tiltingly swivel, and arranged adjacent to said trap-doors, a hook connected to hold said doors closed and arranged to hook over the locking end of said spring-bolt, a fire-extinguishing can resting on said trap-doors, a cord secured at one end to the bottom of each of said cans in said housing, a pulley in said housing arranged to support the opposite end of said cord, a fixed hook depending from said housing, a fusible hook connected to the rear end of said spring-bolt of each can, and arranged to depend therefrom and hook under the fixed depending hook, and a chain extending from the rear end of said spring-bolt, and connected to the cord of the adjacent fire-extinguishing can, said chains of said spring-bolt and said cords of said cans being connected together in successive order throughout the system, so that when the fusible hook of any one housing melts its spring-hook will tilt and the trap-doors and can will drop and the jerk of the can on its cord will pull the spring-bolt free of the trap-door hook in the housing of the adjacent fire-extinguishing can, and the drop of this can will trip the spring-bolt and doors of the next can in the order of their arrangement around the circuit of the system to the can whose fusible hook melted, as set forth.

17. In a fire-extinguisher, the combination of the system of fire-extinguishing cans and their housing-boxes, provided with trap-doors arranged to support the fire-extinguishing cans, the trap-door hooks, the pivotally-tilting spring-bolts in said boxes adapted at their locking ends to look to the bolt ends of said spring-bolts, the fixed hooks in the bottom of said boxes, the fusible hooks connected to the rear ends of said spring locking-bolts, the drop-limiting cords attached to the bottoms of said fire-extinguishing cans, the pulleys in the top of said boxes for supporting said cords, and the chains secured to the rear ends of said spring locking-bolts, and connected to the spring tilting-bolts of the boxes of the adjacent fire-extinguishing cans in the order of their arrangement, around the system, as set forth.

811,222. MATTRESS OR COUCH FABRIC. JOHN HOEY, San Francisco, Cal. Filed Sept. 20, 1905. Serial No. 279,516.

Claim.—1. A mattress or couch fabric consisting of wires bent into zigzag form, rods passing through the bent portions of said loops, said wires having their terminals connected to certain of said rods, said springs at the ends of the rods having one end fixed and the other end adapted to engage said rods.

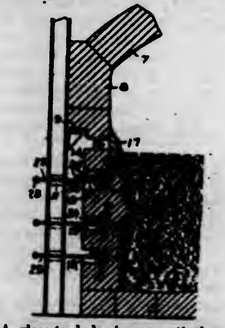
2. A mattress or couch fabric consisting of wires bent into zigzag form, having open loops formed at their angles, rods passing through said loops and uniting a series of zigzag wires to form the width of the mattress, spiral springs having one end fixed and the other adapted to engage the longitudinal rods of the mattress.



3. A mattress consisting of wires bent into zigzag form having loops at their retaining angles, rods passing through said loops, spiral springs with which the ends of the rods are connected, and connections between the terminal ends of each zigzag wire with the ends of the longitudinal rods.

4. A mattress fabric consisting of parallel longitudinally-disposed rods, springs with which the ends of the rods are connected, wires bent to extend diagonally between the rods with loops bent to interlock with said rods, said wires having their ends connected at the junction of the springs and rods.

811,223. REFRACTORY WALL FOR GLASS-TANKS. LEON J. HOUEN, Port Marion, Pa. Filed Aug. 7, 1905. Serial No. 273,162.



Claim.—1. A glass-tank having a vertical wall of refractory material, a portion of said wall being formed of blocks so shaped and laid that their outer end and a horizontal face for at least one-third the length of the blocks are exposed to the atmosphere.

2. A glass-tank having a vertical wall of refractory material, provided on its outer face with an air-recess which extends inwardly for at least one-third the thickness of the wall and is open to the atmosphere.

3. A glass-tank having a vertical wall formed of refractory material, a portion of said wall being formed of L-shaped blocks forming a recess on the outer face of the wall and exposing the outer end and horizontal face of the block to the atmosphere.

4. A glass-tank having a vertical wall formed of refractory material, a portion thereof being formed of blocks so shaped and laid as to provide a recess on their outer faces at the joints between the blocks, thereby exposing the outer ends and a portion of the horizontal faces of said blocks to the atmosphere.

5. A glass-tank having a vertical wall of refractory material provided on its outer face with an air-recess extending inwardly for at least one-third of the thickness of the wall, and being open to the atmosphere, and adapted to receive reinforcing-blocks.

6. A glass-tank having a vertical wall formed of refractory material, a portion thereof being formed of L-shaped blocks so laid as to form an air-recess on the outer face of the wall, and exposing the outer ends and a portion of the horizontal face of said block to the atmosphere, said recess being adapted to receive reinforcing-blocks.

7. A glass-tank having a wall provided with a recess therein, reinforcing-blocks in said recess, and means for holding said blocks in position.

8. A glass-tank having a recess formed in the outer face of its wall adjacent to the level of the molten glass, reinforcing-blocks in said recess, and means for holding said blocks in position.

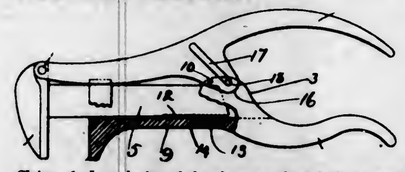
9. A glass-tank having a vertical wall formed of refractory material, the upper portion of said wall being formed of blocks so shaped and laid as to provide a recess on the outer face of the wall located below the level of the glass, and exposing the outer ends and a portion of the horizontal faces of said blocks to the atmosphere.

10. A glass-tank having a vertical wall formed of refractory material provided on its outer face below the level of the glass in the tank with a recess open to the atmosphere and adapted to receive reinforcing-blocks.

11. A glass-tank having a wall formed of refractory material, and means for applying reinforcing-blocks to the outer face thereof below the level of the glass in the tank.

12. A glass-tank having a wall formed of refractory material provided on its outer face with a recess below the level of the glass in the tank, said recess being adapted to receive refractory reinforcing material.

811,224. WRENCH. MATTHEW M. HOWLAND, Providence, R. I. Filed Nov. 1, 1904. Serial No. 230,982.



Claim.—1. In a device of the character described, a movable jaw, a fixed jaw, an operating-handle pivoted on one of said jaws, and means whereby said movable jaw is automatically locked against a further opening movement only when a strain is applied to the jaws.

2. In a wrench, a fixed jaw, a fixed handle, a longitudinally-movable jaw adjustably supported from said fixed jaw and handle, means whereby said jaws may be opened to their fullest extent by one movement of the operating-handle, and means for automatically locking the said jaws.

3. In a wrench, a fixed jaw, a fixed handle, a movable jaw adjustably supported from said fixed jaw, an operating-handle pivoted to one of said jaws, means whereby said jaws may be opened to their fullest extent by one movement of said handle, and means for automatically locking the same, the arrangement being such that said jaws may be closed without actuating the locking device.

4. In a wrench, a fixed jaw and handle, a movable jaw secured to a movable member, said member being adjustably held in said fixed jaw and handle, an adjusting-handle pivoted to one of said jaws, means whereby said jaws may be opened to their fullest extent by one movement of said handle and means for automatically locking said jaws only when a strain is applied to the same.

5. In a wrench, a jaw and handle fixed together, a longitudinally-movable bar supported from said fixed jaw and handle, a movable jaw secured to said movable bar, an adjusting-handle pivoted to the outer jaws, and means for automatically locking said jaws.

6. In a wrench, a fixed jaw and handle, a longitudinally-movable bar supported from said fixed jaw and handle, a movable jaw secured to said movable bar, an adjusting-handle pivoted to one of said jaws, and means on said movable bar arranged to automatically engage said fixed members to lock the jaws only when a strain is applied to said jaws.

7. In a device of the character described, a jaw and handle fixed together, longitudinally-movable members including one jaw supported from said fixed members, means in said movable members arranged to automatically engage means in said fixed members to lock the jaws, and an adjusting-handle for moving one of the jaws to open it to its fullest extent with but one movement of the said handle.

8. In a wrench, a fixed jaw, a fixed handle, an operating-handle, a longitudinally-movable jaw adjustably supported from said fixed jaw and handle, means whereby said jaws may be completely opened by one movement of said operating-handle and means for automatically locking the said jaws, said operating-handle acting independently of the locking means.

9. In a wrench, a fixed jaw and handle, a movable jaw secured to a movable member, said member being adjustably held in said fixed jaw and handle, an adjusting-handle, and means for automatically locking said jaws.

10. In a wrench, a jaw and handle fixed together, a movable jaw secured to a longitudinally-movable bar, said bar being held to slide in said fixed members, an adjusting-handle pivoted to one of said jaws, and means in said bar for automatically locking said jaws.

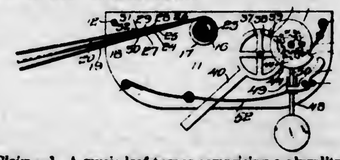
11. In a device of the character described, a jaw and handle fixed together, a movable jaw secured to a longitudinally-movable bar, said bar being held to slide in said fixed members, teeth on said bar to engage corresponding teeth in said fixed members to lock the said jaws from opening, and an adjusting-handle for setting the jaws.

12. In a device of the character described, a jaw and handle fixed together, a movable jaw secured to a longitudinally-movable bar, said bar being held to slide in said fixed members, teeth on said bar to engage corresponding teeth in said fixed members to lock the said jaws from opening, an adjustable handle for setting the jaws, and means in said handle by which the said movable jaw may be opened and closed by the movement of said handle.

13. In a wrench, a jaw and handle fixed together, a movable jaw secured to a longitudinally-movable bar, said bar being held to slide in said fixed members, an adjusting-handle pivoted to one of said jaws, means including a pin working in a slot by which the said movable jaw may be opened and closed by the movement of said handle, and means in said bar for automatically locking said jaws.

14. In a device of the character described, a jaw and handle fixed together, a movable jaw secured to the longitudinally-movable bar, said bar being held to slide in said fixed members, teeth on said bar arranged to automatically engage corresponding teeth in said fixed members to lock the said jaws from opening, an adjusting-handle pivoted to one of said jaws, and means including a pin working in a slot by which the said movable jaw may be opened and closed by the movement of said handle.

811,225. LEAF-TURNER. GUSTAV HUBERT, Baraboo, Wis. Filed Nov. 19, 1904. Serial No. 233,300.



Claim.—1. A music-leaf turner comprising a plurality of movable turning-arms, individual means for moving the arms, a retaining device including upstanding projections for holding each of the arms against the action of its moving means, means for shifting the projections successively out of active position, and means for controlling the shifting means.

2. A music-leaf turner comprising a plurality of movable turning-arms, a retaining device including upstanding projections for holding each of the arms against the action of its moving means, a carrier upon which the projections are mounted and with which they are movable successively into inactive position, spring-actuated means for shifting the carrier and means for releasing the shifting means.

3. A music-leaf turner comprising a plurality of movable turning-arms, a rotatable carrier, upstanding retaining-pins upon the carrier and movable therewith successively into and out of engagement with their respective arms, means for shifting the carrier, an escapement mechanism for controlling the degree of movement of the shifting means, and means for operating the escapement mechanism.

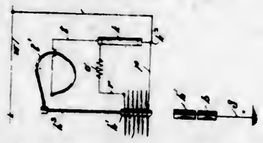
4. A music-leaf turner comprising a plurality of movable turn-

ing-arms, individual means for moving the arms, a retaining device including upstanding pins for holding each of the arms against the action of its moving means, means for shifting the projections successively out of active position, means for controlling the shifting means, and means for moving the arms simultaneously into position for engagement by their retaining means.

5. A music-leaf turner comprising a plurality of movable turning-arms, a rotatable carrier, upstanding retaining-pins upon the carrier and movable therewith successively into and out of engagement with their respective arms, means for shifting the carrier, an escapement mechanism for controlling the degree of movement of the shifting means, means for operating the escapement mechanism, and means for moving the arms simultaneously into position for engagement by their retaining means.

6. A music-leaf turner comprising a plurality of movable turning-arms, a rotatable carrier including a lever, upstanding retaining-pins mounted upon the carrier and movable therewith successively into and out of engagement with their respective arms, the said retaining-pins being of different length, a wheel mounted adjacent the carrier for coöperation with the said pins, a pawl arranged for contact with said wheel, and a lever arranged for manipulating the pawl.

811,226. **LIGHTNING-ARRESTER.** WALTER C. JONES, Chicago, Ill., assignor to Gorton-Danisch Company, Keokuk, Iowa, a Corporation of Iowa. Filed Dec. 7, 1901. Serial No. 85,063.



Claim.—1. In a lightning-arrester, the combination of two continuous paths for the current, non-inductive resistance arranged in one of said paths, and an arrester-coil and a resistance arranged in the other path, substantially as described.

2. In a lightning-arrester, the combination of two continuous paths for the current, non-inductive resistance arranged in one of said paths, and an arrester-coil and an inductive resistance arranged in the other path, substantially as described.

3. In a lightning-arrester, the combination with two continuous paths for the current, of non-inductive resistance arranged in one of said paths, and an arrester-coil and a resistance-coil arranged in the other path, said latter resistance being located between the arrester-coil and the ground, whereby the resistance-coil protects the arrester-coil from the effect of lightning discharges.

4. In a lightning-arrester, the combination with two continuous paths for the current, of a graphite rod constituting a non-inductive resistance located in one of said paths, an arrester-coil and an inductive resistance located in the other path, substantially as described.

5. In a lightning-arrester, the combination with two continuous paths for the current, of an arrester-coil and an inductive resistance located in one of said paths, a pair of clamping devices and a graphite resistance-rod clamped therein, said clamps and graphite rod constituting a part of the second parallel path, substantially as described.

6. In a lightning-arrester, the combination with arcing electrodes, of an arrester-coil, a non-inductive resistance in shunt of said arrester-coil, and a resistance in series with said coil.

811,227. **COMPOSITE INSULATING MATERIAL.** GEORGE KELLY, Hinsdale, Ill. Filed Aug. 16, 1905. Serial No. 274,473.

Claim.—1. The method of producing a self-sustaining insulating board, tile or slab for cold-storage or other insulating purposes, which consists in forming a body of thoroughly-commingled flax fiber, mineral wool and liquid, subsequently forming said body into a board, tile, slab, or other form, and drying the same.

2. The method of producing an insulating board, tile or slab for cold-storage or other insulating purposes, which consists in stirring a wet body of flax fiber and mineral wool until the same are thoroughly commingled, stopping the stirring action prior to the pulping of the same, forming the mixture into a board, tile, slab, or other form, and drying the same.

3. The method of producing an insulating board, tile, or slab for cold-storage or other insulating purposes, which consists in commingling in water substantially equal quantities of mineral wool and degummed short flax fiber, stopping the commingling action prior to the pulping of the fiber, then forming the mixture into a board, tile, slab, or other form, and drying the same.

4. A self-sustaining board, tile, slab, or other form for cold-storage or other insulation, composed of thoroughly-commingled mineral wool and flax fiber.

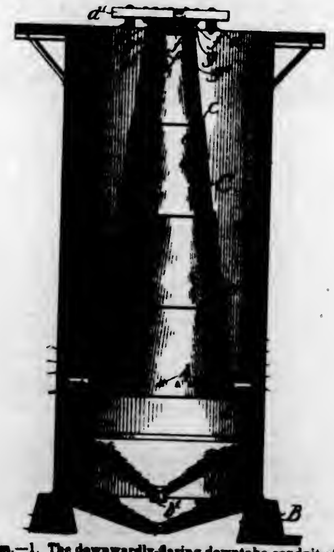
5. A self-sustaining board, tile, slab, or other form for cold-storage or other insulation composed of thoroughly-commingled mineral wool and degummed flax fiber.

6. A self-sustaining board, tile, slab, or other form for cold-storage or other insulation, composed of thoroughly-commingled mineral wool and flax fiber extending throughout the body of the said board, tile, slab, or other form, said fiber and wool being thoroughly commingled with water and dried.

811,228. **BLOWING-ENGINE VALVE.** JULIAN KENNEDY, Pittsburg, Pa. Filed June 20, 1903. Serial No. 162,204.

Claim.—A valve having a longitudinal curved face with spring-pressed packing-strips, the end strips extending at an angle other than a right angle to the longitudinal strips; substantially as described.

811,229. **WATER-PURIFYING APPARATUS.** CARL L. KENNICOTT, Chicago, Ill., assignor to Kennicott Water-Softener Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 26, 1905. Serial No. 247,308.



Claim.—1. The downwardly-flaring downtake-conduit of a water-purifying apparatus of the character described, composed of a series of sections loosely connected one with the other and telescopically collapsible for nesting them and extensible by raising the innermost section for suspending the conduit in its operative position, for the purpose set forth.

2. The downwardly-flaring downtake-conduit of a water-purifying apparatus of the character described, composed of a series of sections having interned and outturned end flanges overlapping each other from one section to the other and loosely connecting the sections together and rendering them telescopically collapsible for nesting and extensible by raising the innermost section for suspending the conduit in its operative position, for the purpose set forth.

3. In combination with the settling-tank of a water-purifying apparatus of the character described, a downtake-conduit flexibly suspended in said tank.

4. In combination with the settling-tank of a water-purifying apparatus of the character described, a support at the upper end of said tank, and a downtake-conduit pivotally suspended on said support to hang in the tank.

5. In combination with the settling-tank of a water-purifying apparatus of the character described, a support at the upper end of said tank, and a downtake-conduit pivotally suspended on said support to swing in two directions at right angles to each other and hang in the tank.

6. In combination with the settling-tank of a water-purifying apparatus of the character described, a support comprising beams laid crosswise on the upper end of said tank, carrying a plate provided with an annular flange having depending eyes, a ring pivotally connected with said eyes to swing in one direction and provided with depending eyes, and a downtake-conduit pivotally connected with the ring-eyes to swing in the direction at right angles to the direction of swinging of said ring.

7. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having openings in the lower portion of its wall, water-guiding arms extending from said openings.

8. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having angular openings in the lower portion of its wall, water-guiding arms of the cross-sectional shape of said openings and extending therefrom.

9. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having openings in the lower portion of its wall, water-guiding arms of inverted-trough shape extending from said openings and having series of openings along their edges and closed outer ends.

10. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having openings in the lower portion of its wall, water-guiding arms of inverted-trough shape extending radially from said openings and having serrated edges forming openings, and closed outer ends.

11. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having triangular openings in the lower portion of its wall, water-guiding arms of inverted-trough shape extending from said openings and having serrated edges forming openings, and closed outer ends, and sustaining means for said arms connecting them with said conduit.

12. In combination with the downtake-conduit of the settling-tank in a water-purifying apparatus of the character described, said conduit having triangular openings in the lower portion of its wall, bearings at said openings on the outer surface of said wall, water-guiding arms of inverted-trough shape supported at their inner ends in said bearings to extend radially from said openings and having serrated edges and closed outer ends, and links containing turnbuckles connecting said arms with said conduit.

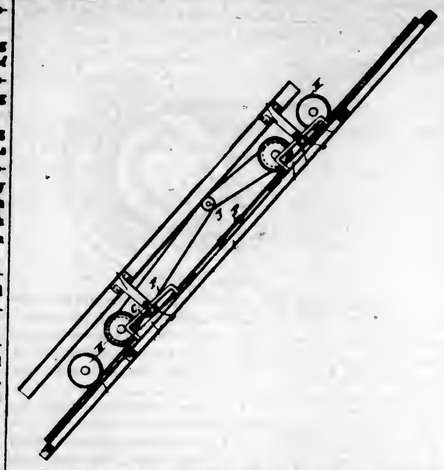
811,230. **TRAVERSING MECHANISM.** SAMUEL L. G. KNOX, Milwaukee, Wis., assignor to The Bucyrus Company, South Milwaukee, Wis., a Corporation of Wisconsin. Filed Apr. 24, 1905. Serial No. 257,104.

Claim.—1. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine is mounted, means for lifting the machine from the track-section at intervals, and means for alternately advancing the track-section and the lifting means as they are relieved of the weight of the machine.

2. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine is mounted, means movably connected with the machine for lifting the same from the track-section at intervals, and means for advancing the track-section when the latter is relieved of the weight of the machine.

3. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine is mounted, means movably connected with the machine for lifting the same from the track-section at intervals, and power mechanism on the machine for advancing the movable track-section when the latter is relieved from the weight of the machine.

4. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine advances, an auxiliary supporting-section for lifting the machine from the main track, and means for successively advancing the respective sections as they are relieved of the weight of the machine.



5. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine advances, an auxiliary supporting-section connected to the machine and having inclines for lifting the machine from the main track-section and means for successively advancing the respective sections as they are relieved of the weight of the machine.

6. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine advances, an auxiliary section having inclines thereon, brackets connecting the machine and the auxiliary section and coöperating with the inclines to lift the machine from the main track-section, and means for successively advancing the respective sections as they are relieved of the weight of the machine.

7. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable track-section upon which the machine advances, an auxiliary section comprising skids having inclines and supporting-yokes thereon, brackets on the machine having rollers coöperating with the inclines and yokes to lift the machine and advance the skids respectively, and means operated by power mechanism on the machine for advancing the main track-section as the latter is relieved of the weight of the car.

8. Apparatus for traversing or transporting excavators or other heavy machinery, comprising a movable-track-section upon which the machine advances, an auxiliary section comprising skids having inclines and supporting-yokes thereon, brackets on the machine having rollers coöperating with the inclines and yokes to lift the machine and advance the skids respectively, a drum on the axle of the machine, a cable wound on the drum and connected at its ends to opposite points on the main track-section, and power mechanism on the machine for driving said axle.

9. In mechanism for traversing or transporting excavators or other heavy machinery, a movable track-section, and means connected therewith for varying the direction of the advance of said track-section.

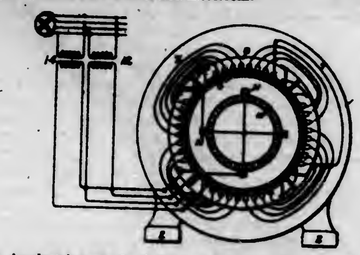
10. In mechanism for traversing or transporting excavators or other heavy machinery, a movable track-section, and adjustable members in the rails of said track-section for varying the direction of advance of the respective rails from straight parallelism to any desired degree of curvature.

11. In mechanism for traversing or transporting excavators or other heavy machinery, a movable track-section, and turnbuckles interposed between the rails of said track-section for varying the direction of the latter.

811,231. **ALTERNATING-CURRENT MOTOR.** BENJAMIN G. LAMME, Pittsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed June 30, 1904. Serial No. 214,691.

Claim.—1. An electric motor having armature and field-magnet windings that are supplied with currents of different phases and hav-

ing field-magnet pole-pieces that are provided with slots parallel to the armature-axis, neutralizing-conductors located in said slots, and low-resistance plates that bridge the spaces between the tips of adjacent pole-pieces and are insulated therefrom.



2. An electric motor having armature and field-magnet windings that are supplied with dephased currents and having field-magnet pole-pieces that are provided with slots parallel to the armature-axis, a neutralizing-winding located in said slots and connected in series with the armature-winding, and low-resistance plates located in the interpolar spaces.

3. The combination with a source of multiphase electrical energy, of a motor having a field-magnet winding supplied from said source with current of one phase and an armature-winding supplied from said source with current of a different phase, field-magnet pole-pieces provided with slots parallel to the armature-axis, a neutralising-winding located in said slots and connected in series with the armature-winding, and plates of low-resistance, conducting material located in the interpolar spaces.

4. An electric motor having armature and field-magnet windings that are supplied with dephased currents and having field-magnet pole-pieces that are provided with slots parallel to the armature-axis, conductors that are connected in series with the armature-winding and are located in said slots for neutralizing the self-induction of the adjacent armature-conductors, and low-resistance plates located in the interpolar spaces for neutralizing the self-induction of the armature-conductors between the pole-tips.

5. An electric motor having armature and field-magnet windings that are supplied with dephased currents and having field-magnet pole-pieces that are provided with slots parallel to the armature-axis, neutralizing-conductors that are located in said slots and are connected in series with the armature-winding and low-resistance plates that are located in the interpolar spaces for neutralizing the self-induction of the armature-conductors between the pole-tips, and insulating material between the plates and the pole-tips.

6. An electric motor having field-magnet pole-pieces provided with slots substantially parallel to the armature-axis, neutralizing-windings located in said slots and connected in series with the armature-winding and low-resistance plates located in the interpolar spaces for neutralizing the self-induction of the armature-conductors between the pole-tips, in combination with means for supplying current of one phase to the field-magnet winding and current of a different phase to the armature and neutralizing windings.

811,232. **VEHICLE-TIRE.** JULES LAND and AUGUST FRIEDEL, Chicago, Ill. Filed Nov. 14, 1904. Renewed June 26, 1905. Serial No. 267,651.

Claim.—1. A vehicle-tire, comprising a tube of resilient material a longitudinal partition subdividing the interior of said tube, and a plurality of longitudinal webs on each side of said partition and extending across the space between said partition and the opposite walls of said tube, the webs on one side of said partition lying in different planes from those on the other side, substantially as described.

2. A vehicle-tire comprising an endless tube of resilient material, an annular partition subdividing the interior of said tube and disposed transversely of the plane of the wheel, and a plurality of annular webs lying substantially parallel to the plane of the wheel and extending between said partition and the opposite walls of the tube, the webs on opposite sides of said partition lying in different planes and meeting the partition at different points, substantially as described.

3. A vehicle-tire, comprising a tube of resilient material, a longitudinal partition subdividing the interior of said tube, and a plurality of transverse webs on each side of said partition and extending across the space between said partitions and the opposite walls of said tube, the webs on one side of said partition lying in different planes from those on the other side, substantially as described.

4. A vehicle-tire comprising a tube of resilient material, a longitudinal partition subdividing the interior of said tube, and a plurality of supports extending between said partition and the opposite walls of said tube, the supports on the opposite sides of said partition being arranged to meet the partition at non-coincident points, substantially as described.

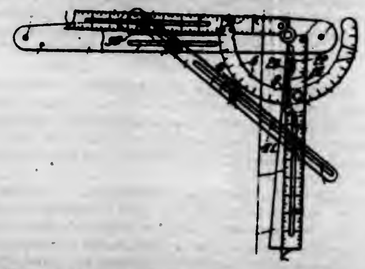
5. A vehicle-tire comprising a tube of resilient material, a longitudinal resilient partition extending across the interior of said tube, a longitudinal web extending transversely of said partition between the same and the walls of the tube on one side of the partition, and a plurality of supports extending transversely between said partition and the wall of the tube on the other side of said partition, said supports meeting the partition at points intermediate of said web and the longitudinal edges of the partitions, substantially as described.

6. A vehicle-tire, comprising a tube of resilient material, a longitudinal resilient partition extending across the interior of said tube, a plurality of longitudinal webs extending transversely of the partition between the same and the wall of the tube at one side of said partition, and supporting means on the other side of said partition extending between the same and the opposite wall of the tube, said supporting means meeting the partition intermediately of said webs and being of considerably less thickness than the space between the adjacent parts of said webs, substantially as described.

7. A vehicle-tire comprising an endless tube of resilient material, an annular partition subdividing the interior of said tube and disposed transversely of the plane of the wheel, a plurality of annular webs lying substantially parallel to the plane of the wheel and extending between said partition and the opposite walls of the tube, the webs on opposite sides of said partition lying in different planes and meeting the partition at different points, and a plurality of webs extending transversely across the spaces between said partition and annular webs, all of said webs being of resilient material, substantially as described.

8. A vehicle-tire comprising an endless tube of resilient material, an annular partition subdividing the interior of said tube and disposed transversely of the plane of the wheel, a plurality of annular webs lying substantially parallel to the plane of the wheel and extending between said partition and the opposite walls of the tube, the webs on opposite sides of said partition lying in different planes and meeting the partition at different points, and a plurality of webs extending transversely across the spaces between said partition and annular webs, said transverse webs being of considerably less thickness than the annular webs and all of said webs being of resilient material substantially as described.

811,233. **STAIR-MARKING TOOL.** MAXIME LEBLANC, Montreal, Canada. Filed June 6, 1905. Serial No. 263,691.



Claim.—1. In a stair-marking tool, a pair of pivotally-connected members, means for locking them in different angular relations to each other, longitudinally-slotted plates connected with each of said members, and an obliquely-extending arm connecting said pivoted members and said plates.

2. In a stair-marking tool, a pair of longitudinally-slotted pivotally-connected members, means for locking them in different angular relations to each other, longitudinally-slotted plates connected with each of said members, locking means therefor, and an obliquely-extending arm connecting said pivoted members and said plates.

3. In a stair-marking tool, a pair of pivotally-connected members, means for locking them in different angular relations to each other, longitudinally-slotted plates connected with each of said members, one of which is slidable longitudinally, and an obliquely-extending arm connecting said pivoted members and said plates.

4. In a stair-marking tool, a pair of pivotally-connected members, means for locking them in different angular relations to each other, longitudinally-slotted plates connected with each of said members, an obliquely-extending longitudinally-slotted telescoping arm connecting said pivoted members and said plates, and locking means slidable in the slots in said arm.

5. In a stair-marking tool, a pair of pivotally-connected members, means for locking them in different angular relations to each other, longitudinally-slotted plates connected with each of said members, one of said plates being wider at one end than at its opposite end, the other of said plates being slidable longitudinally, slotted, slidable connecting members, and locking means adapted to travel in the slots of said connecting members.

6. In a tool of the character described, a jointed marking member comprising a pair of pivotally-connected and longitudinally-slotted arms, plates wider than said arms connected therewith, one of said plates having a perforated extension projecting beyond the joint, and means adapted to secure said marking member and said plates in a plurality of positions.

7. In a tool of the character described, a jointed marking member comprising a pair of pivotally-connected and longitudinally-slotted arms, plates wider than said arms connected therewith, one of said plates having a perforated extension projecting beyond the joint, said plate being reversible and being wider at one end than at its opposite end, and means adapted to secure said marking member and said plates in a plurality of positions.

8. In a stair-marking tool, a pair of pivotally-connected members, a pivot therefor, means for locking said pivoted members at different angles to each other, a longitudinally-slotted plate pivotally mounted on one of said pivoted members, and means for locking said plate in position.

9. In a stair-marking tool, a pair of pivotally-connected members, a pivot therefor, means for locking said pivoted members at different angles to each other, a longitudinally-slotted and perforated plate pivotally mounted on one of said pivoted members, and means for locking said plate in position, the perforated portion of said plate extending beyond the said pivot.

10. In a stair-marking tool, a pair of pivotally-connected members, a pivot therefor, a pair of plates connected with and extending substantially parallel with said pivoted members, one of said plates being wider at one end than at its opposite end and extending beyond said pivot, and means for locking said movable parts in a plurality of positions.

11. In a stair-marking tool, a pair of pivotally-connected members, one of said members having a longitudinally-extending slot therein, the other of said members having a plurality of slots, an approximately parallel plate pivotally connected with one of said members, there being a longitudinal slot in said plate extending parallel with the other of said pivoted members, a pin projecting from said last-mentioned plate into a slot in its companion pivoted member, and means for locking said parts in a plurality of positions.

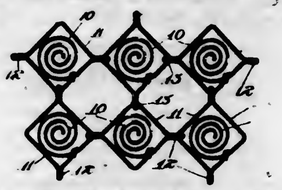
12. In a stair-marking tool, a pair of pivotally-connected members, a pivot therefor, a segment connected with one member, locking means on the other member adapted to engage said segment, and a rectangular filler-block pivotally mounted in proximity to said pivot.

13. In a stair-marking tool, a pair of pivotally-connected members, a pivot therefor, a segment connected with one member, locking means on the other member adapted to engage said segment, and a rectangular filler-block pivotally mounted in proximity to said pivot, there being a laterally-extending step on said filler-block.

14. In a stair-marking tool, a pair of pivotally-connected and longitudinally-slotted members, a pivot therefor, a longitudinally-slotted and perforated plate mounted upon one of said pivoted members, said plate extending beyond said pivot, a longitudinally-slotted plate mounted upon the other pivoted member, and locking means adapted to hold said pivoted members and said plates in different angular relations.

15. In a stair-marking tool, a pair of pivotally-connected and longitudinally-slotted members, a pivot therefor, a longitudinally-slotted and perforated plate mounted upon one of said pivoted members, said plate extending beyond said pivot, a longitudinally-slotted plate mounted upon the other pivoted member, locking means adapted to hold said pivoted members and said plates in different angular relations, and a laterally-extending pin projecting from said last-mentioned plate into a slot in its companion pivoted member.

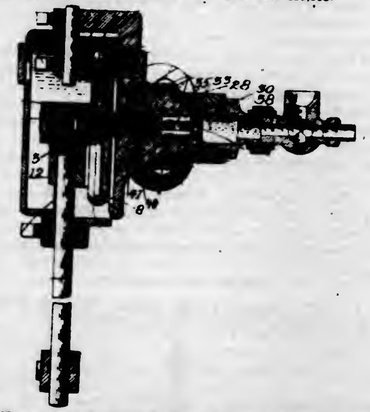
811,284. **SPRINGWORK.** ROY C. MARSOW, Chicago, Ill. Filed Aug. 4, 1905. Serial No. 272,949.



Claim.—1. In a device of the class described, a coil-spring having a rectangular top, an opposite pair of the angles of which are bent into hook form to engage the tops of adjacent springs at points between the hooks of the latter.

2. In a device of the class described, springs arranged in longitudinal and transverse banks or rows and having rectangular tops, one pair of the opposite angles of each top being provided with hooks and the other pair with eyes, and each hook engaging an eye of an adjacent spring, the points of connection between adjacent rows of springs being offset in alternation at opposite sides of a line median of each rows.

811,285. **ROTARY VALVE.** CHARLES W. MANSEL, Buffalo, N. Y., assignor, by mesne assignments, to Mansel Brothers Co., a Corporation of New York. Filed Jan. 21, 1903. Serial No. 139,883.

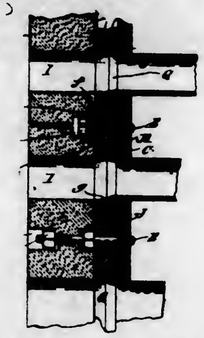


Claim.—1. A device of the class described, having a body provided with a reduced portion, a sleeve fitted to said reduced portion, a rotary valve-block in said sleeve having two curved grooves on one of its faces and an opening extending from one of said grooves through the block, a shaft journaled in the body and operatively connected to the valve-block; said shaft having an exhaust-opening connecting with the other groove in the block and means for intermittently rotating said shaft.

2. In a device of the class described, a tubular body provided with a lateral exhaust-opening, and a reduced portion, a shaft journaled in said body and having a peripheral groove registering with the exhaust-opening, a sleeve fitting upon the reduced portion of the body, a rotary valve-block inclosed in the sleeve and connected to the shaft to rotate in unison therewith, said rotary valve-block being provided on one of its faces with elongated grooves which curve concentrically with the circular periphery of the valve-block and one of said grooves having an additional straight part which extends radially inward and an opening which extends through the block from the other groove, substantially as set forth.

3. In a device of the class described, a tubular body provided with an exhaust-opening and a reduced portion, a shaft journaled in said body and having a peripheral groove registering with the exhaust-opening, a sleeve fitting upon the reduced portion of the body, a rotary valve-block inclosed in the sleeve and connected to the shaft to rotate in unison therewith, said rotary valve-block being provided on one of its faces with elongated curved grooves and an opening which extends through the block, substantially as set forth.

811,236. STEAM-BOILER. GEORGE MARSHALL, Fremont, Nebr. Filed Sept. 5, 1905. Serial No. 276,992.



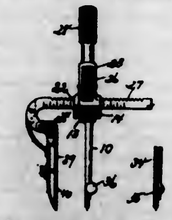
Claim.—1. The combination of a boiler-head, fire-tubes projecting through the head and beaded on their outer ends, a protecting-plate having holes registering with the tubes which is formed with flanges containing grooves to receive the beaded ends of the tubes.

2. The combination of a boiler-head, fire-tubes attached thereto, a protecting-plate made in sections having holes registering with the tubes and secured to the boiler-head, and metallic strips covering the joints between the sections in the front face of the plate.

3. The combination of a steam-boiler, a protecting-plate attached to one of the boiler-heads, a protecting-wall covering the outer face of the protecting-plate and having recesses in its inner and outer faces, headed bolts securing the protecting-plate to the boiler-head having their heads in the inner recesses of the protecting-plate, and headed bolts securing the protecting-wall to the protecting-plate, having nuts arranged in the recesses in the outer face of the protecting-wall.

4. The combination of a boiler-head, fire-tubes projecting through the boiler-head and beaded on their outer ends, a protecting-plate having holes registering with the tubes, flanges around these holes engaging the heads and filling-rings in front of the flanges.

811,237. BEAM-COMPASS. ARTHUR A. MERRITT, New York, N. Y. Filed Jan. 17, 1905. Serial No. 241,462.



Claim.—1. In a beam-compass, a handled needle-leg having a transverse slot, a beam arranged therein and provided with a rack, a loosely-mounted spring-pressed worm carried by the handle and intermeshing with the rack, the opposite sides of the worm projecting beyond the handle in position to be engaged by the fingers, and a marking-leg carried by the beam.

2. In a beam-compass, a handled needle-leg having a transverse slot, a beam arranged therein and provided with a rack, a worm engaging the rack and having its opposite sides projecting beyond the handle in position to be engaged by the fingers, and a marking-leg carried by the beam.

3. In a beam-compass, a handled needle-leg having two transverse slots, each in a plane at an angle to the other, a beam extending through one slot and having a rack, a worm extending through the other slot and intermeshing with the rack, and a marking-leg carried by the beam.

4. In a beam-compass, a handled needle-leg having two transversely-extending slots each in a plane at an angle to the other, a beam extending through one slot and having a rack, a worm extending through the other slot and intermeshing with the rack, an auxiliary means carried by the leg for locking the beam in adjusted position, and a marking-leg carried by the beam.

5. In a device of the class specified, the combination with a transversely-slotted needle-leg, of a beam extending through the slot, a marking-leg carried by the beam, a rack on the beam, a worm engaging said rack, said worm being free to move toward and from the beam, and a spring-pressed friction-plate engaging the periphery of the worm, and tending to force the same in the direction of the beam.

6. In a device of the class specified, the combination with a needle-carrying leg having a transverse slot and provided with a handle, a beam adapted to the slot and provided with a rack, a loosely-mounted worm engaging the rack, a spring-pressed pin carried by the handle, a plate arranged at the end of the pin and bearing on the worm, and a marking-leg at the end of the beam.

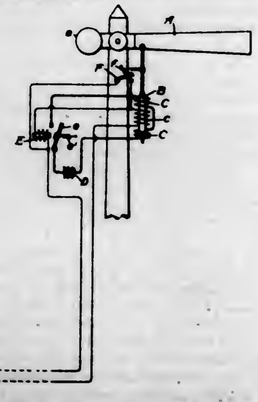
7. In a device of the class specified, a needle-carrying leg having a transverse slot, a beam extending through the slot and provided with a longitudinal groove, a locking-disk having a lug engaging in the groove, means for preventing independent revoluble movement of the disk, and means for clamping said disk against the bottom of the beam.

8. The combination with a needle-carrying leg having a transverse slot, of a beam arranged in the slot and provided with a longitudinal groove, a marking-leg at the end of the beam, a disk carried by the leg, and having a lug engaging in said groove, means for preventing independent rotative movement of the disk, and a clamping-nut engaging said disk.

9. The combination with a needle-carrying leg having peripheral threads and provided with a keyway, of a beam supported by the leg and having a longitudinal groove in its lower face, a marking-leg at the end of the beam, a disk carried by the leg and having a lug entering the groove, there being a projecting lug on said disk fitting within the keyway, and a clamping-nut mounted on the threaded portion of the leg and engaging said disk.

10. The combination with a needle-carrying leg, of a beam supported thereby and provided on one face with graduations, a marking-leg carried by the beam, a rack on said beam, and a worm engaging the rack, the helical thread of the worm being also graduated.

811,238. SIGNAL. KARL MÖLLER, Charlottenburg, Germany, assignor to General Electric Company, a Corporation of New York. Filed June 12, 1905. Serial No. 264,779.



Claim.—1. In combination, a counterweighted signal, a solenoid adapted to shift said signal and having two windings, a local circuit comprising one of said windings and a local source of current, a distant control-circuit including the other winding, a relay connected to said control-circuit and controlling the local circuit, and a switch operated by the movement of the signal and arranged to controlling the local circuit.

2. In combination, a counterweighted signal, a solenoid adapted to shift said signal and having two windings, a local circuit comprising one of said windings and a local source of current, a distant control-circuit including the other winding, a relay connected to said control-circuit and controlling the local circuit, and a switch operated by the movement of the signal and arranged to de-energize said relay to open said local circuit.

3. In combination a counterweighted signal, a solenoid adapted to shift said signal and having two windings, a local circuit comprising one of said windings and a local source of current, a distant control-circuit including the other winding, a relay connected to said control-circuit and controlling the local circuit, and a switch operated by the movement of the signal and arranged to short-circuit said relay.

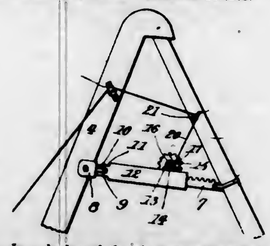
4. In combination, a counterweighted signal, a solenoid adapted to shift said signal and having two windings, a local circuit comprising one of said windings and a local source of current, a control-circuit including the other winding and a distant control-station, means controlled from said distant station for closing the local circuit, and means controlled by the movement of said signal for opening the local circuit.

811,239. MANUFACTURE OF NICKEL-COPPER ALLOYS. AMBROSE MONELL, New York, N. Y. Filed Apr. 20, 1905. Serial No. 256,677.

Claim.—1. The method of making an alloy of nickel and copper which consists in smelting ore containing sulfids of said metals, bessemerizing the resulting matte, calcining the bessemerized product to bring the metals into the form of oxids, then reducing the oxids and producing directly a malleable nickel-copper alloy without separating these metals from each other.

2. The method of making an alloy of nickel and copper which consists in smelting ore containing sulfids of said metals, bessemerizing the resulting matte, calcining the bessemerized product to bring the metals into the form of oxids, then reducing the oxids and producing directly a malleable nickel-copper alloy without separating these metals from each other, and then working the said alloy into commercial form.

811,240. DELIVERY-SPOUT. JOSEPH F. MCDERMOTT, Umatilla, Canada. Filed Apr. 24, 1905. Serial No. 257,161.

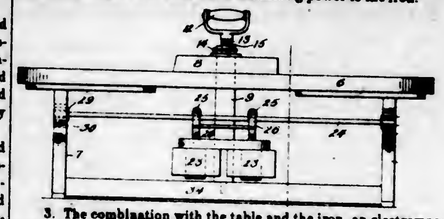


Claim.—In a device of the character described, an elevator, a bagging-spout, a bracket connected with one of said members, said bracket having a perforated extension, a housing having a perforated and bifurcated extension pivotally connected with the extension of said bracket, a rack slidable longitudinally in said housing, a pinion mounted on said housing in mesh with said rack, a ratchet rotatable with said pinion, a pawl normally in engagement with said ratchet, and means for releasing said pawl.

811,241. MACHINE FOR PRESSING CLOTHING. FREDERICK G. HORTON, Chicago, Ill., assignor to The Horton Electrical Manufacturing Company, a Corporation of New Jersey. Filed Sept. 19, 1904. Serial No. 224,941.

Claim.—1. The combination with the table and the iron, of a magnet and armature for depressing the iron, each magnet and armature being located in close proximity to each other and upon the same side of the table, and a rigid connection for transmitting power to the iron.

2. The combination with the table and the iron, of a magnet and armature for giving pressing power to the iron, each magnet and armature being located in close proximity to each other, and below the table, and a rigid connection for transmitting power to the iron.



3. The combination with the table and the iron, an electromagnet and armature, one of which is movable relative to the other and connected to the iron by a rigid connection so that the iron is depressed whenever the magnet is energized.

4. The combination with the table and the iron, of an electromagnet and armature, one of which is movable relative to the other and both of which are located below the table, and a rigid connection between the iron and the moving one of said electric parts, whereby the iron is depressed by the direct action of the electromotive force.

5. The combination in a seam-pressing machine, of an iron, a table along which the iron is movable, electromotive power mechanism movable with the iron, and a rigid connection between said mechanism and the iron, the mechanism depressing the connection and thereby depressing the iron.

6. The seam-pressing machine wherein are combined an iron, a rigid frame joined to the iron, and an electromagnet exerting a direct pull upon the frame and thereby causing the desired pressure by the iron and the armature coacting with said magnet.

7. In a seam-pressing machine, the combination of an electrically-depressed iron and its electric operating means, the latter being arranged wholly at one side of the table so that the lines of force do not pass through the table or cloth and a connection between said electric operating means and the iron.

8. In a seam-pressing machine, the combination of an electrically-depressed iron, and electric means for depressing the same, the iron forming no part of said depressing means but being mechanically connected thereto.

9. The combination with the stationary table and iron movable lengthwise of the table, of electric power devices movable along the table with the iron and causing the pressure by the iron, and a connection between the iron and said power devices, the latter traveling with the iron and embodying a pivotal joint permitting some movement by the iron independent of the power devices.

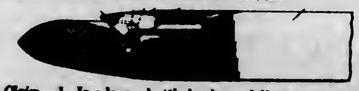
10. The combination with the table and iron, of electric power devices movable along the table with the iron and causing the pressure by the iron, and a connection between the iron and said power devices and traveling with them, said connection embodying a pivotal joint provided with engaging lugs for insuring the movement of the connection with the iron when the latter is moved in one direction.

11. The combination with the table and iron, of electric power devices movable along the table with the iron and causing the pressure by the iron, and a connection between the iron and said power devices and traveling with them, said connection embodying a joint permitting vertical adjustment of the iron.

12. The combination with the table and the iron, of a depressible magnet movable with the iron along the table, an armature made long enough to serve the magnet in any position of the latter, and a frame connecting the magnet to the iron.

13. The combination with the table and the iron of a depressible magnet movable along the table, ways upon which the magnet moves and is supported, an armature capable of serving the magnet in all its different positions, and a rigid movable frame connecting the magnet to the iron.

811,242. LOOM-SHUTTLE. CHARLES B. NUTTING, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed June 8, 1905. Serial No. 264,269.



Claim.—1. In a loom-shuttle having a delivery-eye and adapted to contain a supply of filling, a longitudinal thread-passage, a rotatable thread-guide at the front end of said passage and around which the filling-thread passes to the delivery-eye, and means to prevent

portion located transverse to the arm and bearing a plural number of

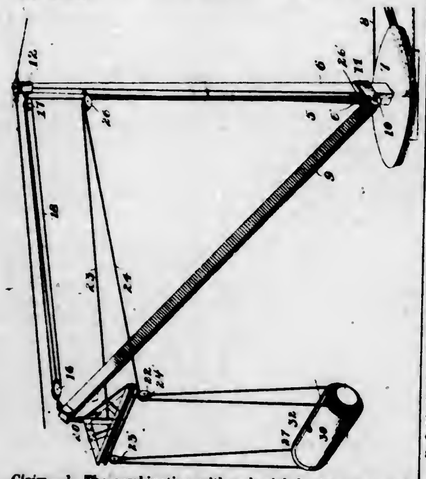
3. The combination with a portable boiler, of an auxiliary

ble thread-guide at the front end of said passage and around which the filling-thread passes to the delivery-eye, and means to surround the lower end of the thread-guide and prevent passage of the filling-thread thereunder.

2. In a loom-shuttle having a delivery-eye and adapted to contain a supply of filling, a self-threading device provided with a longitudinal thread-passage, means to automatically direct the filling-thread from the passage to the delivery-eye, a depending pin on the threading device at the front end of the passage, and a guide-sleeve rotatably mounted on the pin and around which the filling-thread passes to the delivery-eye, the shuttle-body having a socket into which the lower end of the sleeve loosely enters, to prevent catching of the filling-thread.

3. In an automatically-self-threading loom-shuttle adapted to receive a supply of filling and having a side delivery-eye and a longitudinal thread-passage, means to direct the filling-thread to said passage and thence from the front end thereof to the delivery-eye, including a horn, a depending pin adjacent the horn and having a head at its lower end, and a sleeve rotatably mounted on the pin and around which the filling-thread passes as it is directed by the horn to the delivery-eye, the shuttle-body having a socket to loosely receive the lower end of the sleeve and house the same and the head of the pin, to prevent catching of the thread between the head and the sleeve.

811,243. COMBINED DERRICK AND CONCRETE-MIXER. James L. Parsons, Jr., Washington, D. C. Filed Apr. 12, 1905. Serial No. 255,215.



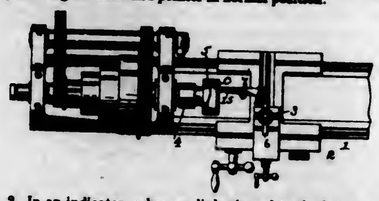
Claim.—1. The combination with a derrick having a movable boom, of a yoke secured directly to the outer end of said boom, sheaves carried upon the ends of said yoke and a load-carrying receptacle adapted to be simultaneously elevated and rotated by the load-lines of the derrick, said load-lines passing over the sheaves carried by the yoke.

2. The combination with a derrick having a movable boom, of a yoke secured directly to said boom adjacent the outer end thereof, sheaves carried by the outer ends of said yoke, load-lines passing over said sheaves and a receptacle having grooved wheels around which said load-lines pass.

3. The combination with a derrick comprising a mast capable of movement upon its axis and a boom carried by said mast and pivoted for vertical movement thereto, of a yoke secured directly to said boom adjacent the outer end thereof, load-lines, sheaves carried by the outer ends of the yoke over which said load-lines pass and a receptacle with which said load-lines engage, in such manner as to be simultaneously rotated and moved in a vertical plane by said load-lines.

811,244. INDICATOR FOR LATHES. Gustave B. Pfenning, Hartford, Conn. Filed Apr. 20, 1904. Serial No. 203,804.

Claim.—1. In an indicating device, an indicator-arm with means of attachment, an indicating-lever mounted on said arm and including a portion extending lengthwise of the arm and an offset portion located transverse to the arm and bearing a plural number of contact-faces, an indicating-pointer located on the arm in extension and connected with the main part of said lever, and means for resiliently holding the lever and pointer in normal position.



2. In an indicator, a base, a link pivoted to the base, a clamp for said pivot, an indicator-arm pivoted to said link by a pivot extending transverse to the pivot between the link and base, means for clamping the pivot between the arm and link, an indicating-lever mounted on said arm and having a main portion extending lengthwise of the arm and a bent portion extending transverse to the main portion said bent portion having a plural number of contact-faces, a pointer located on the arm in extension of and connected with the main part of the lever, and means for resiliently holding the arm and pointer in normal position.

3. In an indicating device, an indicator-arm with means of attachment, an indicating-lever extending lengthwise of the arm and pivoted thereon and having a short extension located at an angle to the main portion of the lever, said short extension having contact-points arranged laterally on opposite sides of the lengthwise center thereof, and an indicating-pointer to be operated by said lever.

4. In an indicating device, a narrow indicator-arm with means of attachment, an indicating-lever pivoted on the arm with a short extension located at an angle of less than ninety degrees to the main portion of the lever, said short extension forming a contact and the longer extension from the pivot connected with an indicating-pointer, the indicating-pointer pivoted on the arm with a short extension from the pivot connected with the indicating-lever and with a longer extension from the pivot forming an indicating-pointer, and means for resiliently holding the pointer and lever in normal position.

5. In an indicating device an indicator-arm with means for attachment, an indicating-lever mounted on the arm and having an extension provided with a plural number of contact-faces, a pair of spring-arms secured on the under side of the lever, an indicating-pointer having a short arm with a stud located between the resilient arms on the lever, the opposite end of the pointer forming an indicating device and means for resiliently holding the pointer and lever in normal position.

6. In an indicator, an indicator-arm provided with means for attachment to a tool-post, an indicating-lever pivotally connected to the arm, a pointer mounted on the arm, a connection between said pointer and lever including a pair of resilient members mounted on one of said parts, and a stud projecting from the opposite part and arranged between said resilient members.

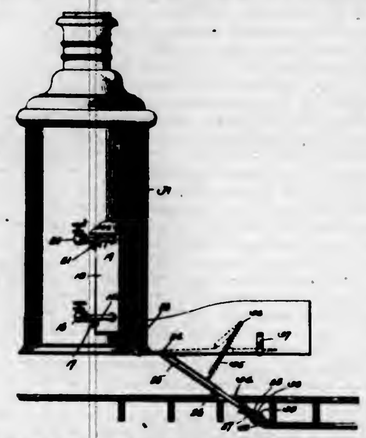
7. In an indicator, an arm provided with means of attachment to a tool-post, an indicating-pointer pivotally mounted on the arm, an indicating-lever pivotally mounted on the arm and connected with the pointer, a spring with one end engaged with the arm, a disk having a recess for engagement of the opposite end of said spring, and means for holding the disk against accidental movement.

811,245. APPARATUS FOR MAINTAINING HOT-WATER OR STEAM PRESSURE IN PORTABLE BOILERS. Charles C. Rich, Mount Vernon, N. Y., assignor of one-third to John U. Bonshelle and one-third to Wm. H. Bonshelle, Montclair, N. J. Filed Apr. 8, 1905. Serial No. 254,538.

Claim.—1. The combination with a portable boiler, of an auxiliary heater having circulating connections with the boiler, and permanently secured thereto, a gas-burner for the auxiliary heater, and a gas-supply pipe connected thereto and including a slip connection that is automatically detached and a valve that is automatically closed when the boiler is moved.

2. The combination with a portable boiler, of an auxiliary heater having a permanent circulating connection with the boiler, a gas-burner for said heater, a nippled pipe-section having a swing-joint connection with the burner-pipe, a service-pipe, a valve-chamber arranged at the end of the service-pipe and adapted to receive the nipple, and a valve disposed in said chamber and movable to open position by contact with said nipple.

3. The combination with a portable boiler, of an auxiliary heater having a circulating connection with the boiler, a gas-burner for said heater, a swinging gas-pipe arranged to extend through an opening in the floor of the engine-house, and a service-pipe terminating in the open-ended valve-casing at a point adjacent to said opening.



4. In an auxiliary heating apparatus for portable boilers, a service-pipe arranged under the floor of an engine-house, an open-ended valve-chamber carried by the pipe at a point adjacent to an opening in the floor, a swinging gas-pipe carried by the portable boiler and having one end insertible through the opening and into the valve-chamber, and means for automatically elevating said pipe when its end is pulled from the valve-chamber.

5. The combination with a portable boiler, of an auxiliary heater having a circulating connection therewith, a gas-burner for the heater, a gas-pipe leading to the burner, a second pipe having a swing-joint connection with the first pipe, a pipe-section telescopically mounted on said second pipe and having a terminal nipple arranged to pass through an opening in the floor of an engine-house, a stop-bracket carried by the portable boiler, a spring tending to raise the telescopic pipes into engagement with the bracket, a service-pipe arranged under the floor of the engine-house, a valve-chamber at the end of the service-pipe and provided with a flaring mouth for the reception of the nipple, a valve mounted in said chamber, a valve-stem carrying the valve, a spring tending to close the valve, and a perforated disk secured to the stem and adapted to be engaged by said nipple.

6. The combination with a portable boiler, of an auxiliary heater, valved circulating-pipes between the boiler and heater, an air-cock in one of said pipes, and a drainage-valve in the other pipe to permit the discharge of water from the auxiliary heater.

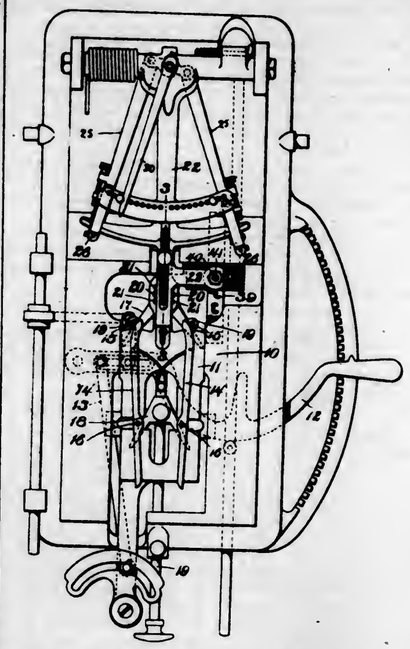
7. The combination with a portable boiler, of an auxiliary heater including a pair of approximately concentric conical coils, the windings of the lower portion of the inner coil being arranged closely together, and the windings of the upper portion thereof being disposed in spaced relation, a disk or plate for preventing direct passage of the products of combustion from the top of the inner coil, and circulating-pipes connecting both coils to the boiler.

8. The combination with a portable boiler, of an auxiliary heater including a casing, a pair of circulating-pipes leading thereinto, and branched to form a pair of approximately concentric coils, the outer of said coils having its windings arranged in contact with each other and forming a close wall around the spaced windings of the upper portion of the inner coil, and a disk or plate for closing the combustion-space at the top of the inner coils.

811,246. VAMP-MARKING MACHINE. John F. Reeves, Bethel, Me. Filed May 2, 1904. Serial No. 206,229.

Claim.—1. In a vamp-marking machine, a vamp-supporting bed, a vamp-gage, a marking-point positioned to mark the edge of the toe portion of a vamp engaged with said gage, means for adjusting said point longitudinally of the bed, and stops for limiting the movement of said means.

2. In a vamp-marking machine, a vamp-supporting bed, a vamp-gage, a plurality of marking-points positioned to mark the edges of the toe portion of a vamp engaged with said gage, and means for independently adjusting one of said points longitudinally of the bed.



3. In a vamp-marking machine, a vamp-supporting bed, a pair of vamp-marking devices, and means to simultaneously and oppositely adjust said devices longitudinally of said bed.

4. In a vamp-marking machine, a vamp-supporting bed, a holder pivotally movable toward and from the same, angularly-adjustable arms on said holder provided with marking devices, and means to simultaneously and oppositely adjust said arms in a radial direction.

5. In a vamp-marking machine, a vamp-supporting bed, a holder movable toward and from the same, a gage for the inner edge of the vamp adjustable in width, and an auxiliary gage adjustable longitudinally of the bed independently of the first said gage.

6. In a vamp-marking machine, a vamp-supporting bed, a holder movable toward and from the same, a shiftable gage-carrier formed with longitudinally-distributed pin-holders, a gage for the inner edge of the vamp mounted on said carrier, and an auxiliary gage composed of a pair of pins adapted for mounting on the respective said pin-holders.

7. In a vamp-marking machine, a gage-carrier, a gage for the inner edge of the vamp mounted on said carrier, and a middle-line vamp-marker mounted on said carrier.

8. In a vamp-marking machine, a movable vamp-supporting gage-carrier, a gage therefor, a middle-line vamp-marking point movable with said carrier, yielding means for holding said point away from the vamp, and means for pressing the point against the vamp.

9. In a vamp-marking machine, a vamp-supporting bed, a gage-carrier adjusted longitudinally thereof, a gage mounted on said carrier, a spring-arm mounted on said carrier and having a normally elevated marking-point, means to fix said arm at different adjustments longitudinally of the gage-carrier, and a vamp-marking holder movable toward and away from said bed and adapted to depress said spring-arm.

10. In a vamp-marking machine, a vamp-supporting bed, a holder movable toward and from the same, a gage for the inner edge of the vamp, and two pairs of marking devices on said holder positioned to mark the side edges of the toe portion of a vamp held against said gage and relatively adjustable.

11. In a vamp-marking machine, a vamp-support, a gage, a

loosely mounted upon the shaft, arms projecting from the

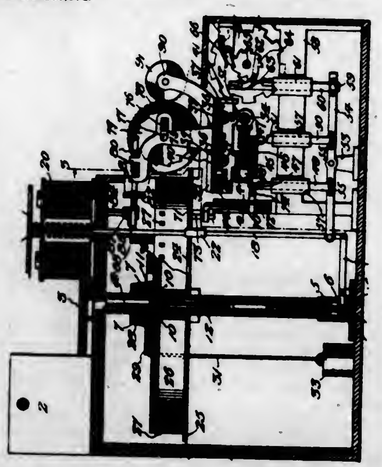
11. In a vamp-marking machine, a vamp-support, a gage, a holder movable toward and away from the support, slides carried by the holder on opposite sides of the center thereof in line with the sides of a vamp held against the gage, marking-points carried by the slides, and means for adjusting the slides longitudinally of the support.

12. In a vamp-marking machine, a vamp-supporting bed, a holder movable toward and from the same, a gage for the inner edge of the vamp, two pairs of marking devices on said holder positioned to mark the side edges of the toe portion of a vamp held against said gage and relatively adjustable toward and from said bed to permit the operation of either pair singly, and means for effecting a relative longitudinal adjustment of said marking devices.

13. A gage for vamp-marking machines consisting of broad flat plates adapted to support the vamps and pins mounted on and projecting from said plates to constitute abutments for the edges of the vamps.

14. A gage for vamp-marking machines consisting of flat plates and pins mounted on and projecting from said plates to constitute abutments for the edges of the vamps, the plates having provisions for adjustment of the pins thereon.

811,247. **ELECTRICALLY-OPERATED TYPE-WRITER.** WILLIS J. ROUSSEL, New Orleans, La., assignor of one-eighth to Alphonse King, Chicago, Ill. Filed Mar. 20, 1903. Renewed July 20, 1904. Serial No. 213,674.



Claim.—1. In a type-writer of the character described, the combination with a motor; of a shaft operated by said motor, a type-wheel loosely mounted upon the shaft, means for locking the wheel to said shaft, teeth upon the wheel, a pawl normally engaging one of said teeth, a magnet, and an armature for said magnet, said armature being connected to and adapted to operate the pawl and locking means.

2. In a type-writer of the character described, the combination with a motor; of a shaft adapted to be operated thereby, a wheel loosely mounted upon the shaft, means for locking the wheel to the shaft, a flange upon the wheel, a weighted flexible strip connected to the flange, a magnet, and an armature for said magnet, said armature being connected to and adapted to operate the locking means, whereby the wheel is rotated and the flexible strip wound thereon.

3. In a type-writer of the character described, the combination with a motor; of a shaft adapted to be operated thereby, a type-wheel loosely mounted upon the shaft, a flange upon the wheel, a weighted flexible strip connected to said flange, means for locking the wheel upon the shaft, a series of ratchet-teeth encircling the wheel, a pawl normally engaging one of said teeth, a magnet, and an armature for said magnet, said armature being connected to and adapted to operate the pawl and locking means, whereby the wheel may be simultaneously released from the pawl and rotated with the shaft, thereby winding the flexible strip thereon.

4. In a type-writer of the character described, the combination with a motor; of a shaft adapted to be rotated thereby, a wheel loosely mounted upon the shaft, type projecting from the periphery thereof, a toothed flange encircling the wheel, means for locking the wheel to the shaft, a pawl normally engaging one of the teeth, a magnet, and a spring-pressed armature for said magnet, said armature being connected to and adapted to operate the pawl and locking means.

5. In a type-writer of the character described, the combination with a motor; of a shaft adapted to be operated thereby, a type-wheel loosely mounted upon the shaft, a conical extension upon said wheel and inclosing the shaft, said extension having a serrated inner face, a conical sleeve upon the shaft and adapted to rotate therewith, a magnet, and an armature connected to the sleeve and adapted to move the same into engagement with the extension of the wheel.

6. The combination with a motor; of a tubular shaft adapted to be rotated thereby, a type-wheel loosely mounted upon the shaft, a hollow conical extension upon the wheel having a serrated inner face, a spindle slidably mounted within the shaft, arms thereto projecting through slots in the shaft, a conical sleeve connected to said arms and having a serrated outer face, a magnet, and an armature connected to the spindle and adapted to throw the sleeve into engagement with the extension upon the wheel.

7. The combination with a motor; of a tubular shaft adapted to be operated thereby, a type-wheel loosely mounted upon the shaft, a hollow extension upon the wheel having a serrated inner surface, a sleeve mounted upon the shaft having a serrated outer surface, a sectional spindle slidably mounted within the shaft, arms thereto projecting through slots in the shaft and connected to the sleeve, a spring-cushion interposed between the sections of the spindle, a magnet, and an armature for said magnet, said armature being connected to and adapted to operate the spindle, whereby the sleeve is placed into engagement with the extension on the wheel.

8. The combination with a motor; of a tubular shaft adapted to be rotated thereby, a type-wheel loosely mounted upon the shaft, a hollow extension thereon having a serrated inner face, a sleeve slidably mounted upon the shaft and having a serrated outer face, a sectional spindle slidably mounted within the shaft, arms thereto projecting through slots in the shaft and secured to the sleeve, a spring-cushion interposed between the sections and the spindle, a lever connected to the spindle, a magnet, an armature thereto, and a rod connecting the armature and lever.

9. In a type-writer of the character described, the combination with a motor; of a tubular shaft adapted to be operated thereby, a type-wheel supported by and loosely mounted upon said shaft, a flange upon the wheel, a hollow extension on the wheel having a serrated inner face, a weighted flexible strip connected to the flange, a serrated sleeve slidably mounted upon the shaft, a sectional spindle slidably mounted within the shaft and connected to said sleeve, a spring-cushion interposed between the sections of the spindle, a lever connected to the spindle, a magnet, a spring-pressed armature thereto, and a rod connecting the armature and lever.

10. The combination with a motor; of a shaft adapted to be rotated thereby, a type-wheel loosely mounted upon the shaft, a toothed flange inclosing the wheel, a serrated extension upon the wheel, a serrated sleeve slidably mounted upon the shaft, a sectional spindle connected to said sleeve, a spring-cushion interposed between the sections, a lever connected to the spindle, a magnet, a spring-pressed armature, a rod connecting the armature and lever, a pawl upon the rod normally engaging one of the teeth of the flange, and a weighted flexible strip connected to and adapted to be wound by the rotation of the wheel.

11. The combination with a type-wheel, a motor, and electrically-operated means for connecting said wheel to the motor; of alternately-operating plungers connected to and operated by said means, a carriage, a spring-pressed bar slidably mounted upon the carriage, parallel series of ratchet-teeth depending from the bar and adapted to be engaged, and moved longitudinally by, the plungers, a revoluble rod, a cam thereon bearing upon the bar, an arm to said rod, and means upon the type-wheel for contacting with and operating said arm and rod, whereby the ratchet-teeth are shifted from position above the plungers.

12. The combination with a motor, a type-wheel, and electrically-operated means for placing said wheel in operative relation with the motor; of alternately-operating spring-pressed plungers, a carriage, a spring-pressed sliding bar upon the carriage, parallel series of depending ratchet-teeth upon said bar adapted to be alternately engaged, and moved longitudinally by, the plungers, a revoluble rod, a cam thereon normally bearing upon the bar of the ratchets, an arm to the rod, and means upon the type-wheel for engaging the arm and imparting lateral movement to the bar and ratchets.

13. The combination with a motor, a type-wheel, and electrically-operated means for placing said wheel in operative relation with the motor; of a longitudinally-movable carriage, a spring-pressed base-plate thereon, a cam-wheel, a plunger, means thereon for rotating said wheel and imparting a reciprocating motion to the base-plate, said plunger being connected to the electrically-operated means.

14. The combination with a motor, a type-wheel, and electrically-operated means for placing said wheel in operative relation with the motor; of a longitudinally-movable carriage, a spring-pressed base-plate slidably mounted upon the carriage, a revoluble cam-wheel, a ratchet-wheel connected thereto, a plunger, a pawl thereon adapted to engage the ratchet and impart a rotary motion to the cam-wheel, thereby reciprocating the base-plate, and means for operating said plunger.

15. In a type-writer of the character described, the combination with a motor, a type-wheel, a magnet, a spring-pressed armature, and means connected to said armature for placing the wheel in operative relation with the motor; of a longitudinally-movable carriage, a spring-pressed base-plate slidably mounted thereon and carrying a platen, a rotary cam-wheel, a ratchet-wheel connected thereto, a plunger connected to and adapted to be operated by the spring-pressed armature, and a pawl upon the plunger engaging the ratchet-wheel, and adapted to rotate the same, whereby a reciprocating motion is imparted to the base-plate.

16. The combination with a motor, a type-wheel, a magnet, a spring-pressed armature, and means connected to said armature for locking the type-wheel to the motor; of a longitudinally-movable carriage, a spring-pressed base-plate slidably mounted thereon and carrying a platen, a wheel, cam projections upon the periphery thereof, a ratchet-wheel connected thereto and revoluble therewith, a lever connected to the spring-pressed armature, a plunger operated by said lever, and a pawl thereon normally engaging the ratchet-wheel and adapted to rotate the cam-wheel and thereby impart a reciprocating motion to the base-plate and platen.

17. The combination with a motor, a type-wheel, a magnet, a spring-pressed armature, and means connected to and operated by the armature for locking the wheel to the motor; of a longitudinally-movable carriage, a platen journaled thereon, a ratchet-wheel connected to the platen, a spring-pressed plunger engaging the ratchet-wheel and a slidable strip adapted to contact with and operate the plunger, a cam for operating said strip, and means upon the type-wheel for rotating the cam.

18. In a type-writer of the character described, the combination with a casing; of a motor, a type-wheel, a magnet, a spring-pressed armature, means connected to and operated by the armature for locking the wheel to the motor, a longitudinally-movable carriage, a platen journaled thereon, a ratchet-wheel connected to the platen, a spring-pressed plunger engaging the ratchet-wheel, guides within the casing, an operating-strip slidably mounted thereon, a cam, a bar upon the strip, and means upon the wheel for rotating the cam.

19. In an electrically-operated type-writer, the combination of a motor, a type-wheel, a clutch for throwing the type-wheel into and out of engagement with the motor, means for holding the type-wheel stationary, and electrically-controlled means acting both to operate the clutch and the type-wheel-holding means.

20. In an electrically-operated type-writer, the combination of a motor, a type-wheel, clutch mechanism for throwing the type-wheel into and out of engagement with the motor, means for holding the type-wheel inactive, and electrically-controlled mechanism for first operating the clutch and then operating the type-wheel-holding means.

21. In an electrically-operated type-writer, a motor, a type-wheel, magnet-controlled means for throwing the type-wheel into and out of engagement with the motor, means for holding the type-wheel stationary, a longitudinally-movable and laterally-shiftable carriage, a tension device for moving the carriage in one direction, means for propelling the carriage step by step in the opposite direction, magnet-controlled means for throwing the type-wheel into and out of engagement with the motor, and operating the type-wheel-holding means, and means operated by the said magnet-controlled means for operating the step-by-step propelling mechanism and laterally shifting the carriage.

22. In an electrically-controlled type-writer, the combination of a motor, a type-wheel, means for throwing said type-wheel into and out of engagement with the motor, and a combined spindle controlling the means whereby the type-wheel is thrown into and out of engagement with the motor.

23. In an electrically-operated type-writer, the combination of a motor, a type-wheel, a clutch for throwing the type-wheel into and out of engagement with the motor, a spring-cushioned spindle for actuating the clutch, and electrically-controlled means for actuating said spindle.

24. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a carriage provided with two sets of ratchet-teeth, means for moving the carriage in one direction, and plungers adapted to engage the teeth for moving the carriage in the opposite direction.

25. In an electrically-operated type-writer, the combination of a motor, type-wheel actuated thereby, a carriage, a tension device for moving the carriage in one direction, and plungers operating on the carriage for moving the carriage in opposition to the influence of the tension device.

26. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a carriage provided with two series of teeth having inclined faces, a tension device for moving the carriage in one direction, and plungers operating against the inclined faces of the teeth for advancing the carriage in the opposite direction against the influence of the tension device.

27. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a laterally-shiftable carriage, a tension device for moving the carriage in one direction, mechanism for propelling the carriage in the opposite direction, and means for shifting the carriage laterally to effect a disengagement between said carriage and the propelling mechanism.

28. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage provided with two sets of teeth, a tension device for moving the carriage in one direction, plungers acting on the teeth to move the carriage in the opposite direction, and means for shifting the carriage laterally to effect a disengagement between the carriage and the mechanism employed to move the carriage against the influence of the tension device.

29. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage, a tension device for moving the carriage in one direction, means for propelling the carriage step by step in the opposite direction, and a cam for effecting a disengagement between the carriage and the step-by-step propelling mechanism.

30. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage, a rotary platen mounted on the carriage, ratchet mechanism for imparting rotary intermittent movement to the platen, and means whereby the type-wheel is adapted to actuate said ratchet mechanism.

31. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable carriage, a rotary platen mounted thereon, ratchet mechanism for imparting intermittent rotary movement to the platen, a spring-retracted presser-bar, and means controlled by the type-wheel for operating said presser-bar and actuating the ratchet mechanism.

32. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a carriage, a rotary platen mounted thereon, ratchet devices at opposite ends of the platen for imparting rotary intermittent movement thereto, a presser-bar common to both ratchet devices, and means controlled by the type-wheel for moving the presser-bar and actuating the ratchet devices.

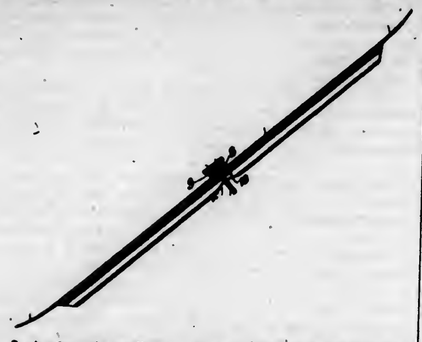
33. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage, a platen mounted thereon and movable toward and away from the face of the type-wheel, and mechanism embodying a cam for shifting the carriage laterally and moving the platen toward the type-wheel.

34. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage, a platen mounted thereon, means for holding the platen away from the face of the type-wheel, and a cam for shifting the carriage and urging the platen toward the type-wheel.

35. In an electrically-operated type-writer, the combination of a motor, a type-wheel actuated thereby, a longitudinally-movable and laterally-shiftable carriage, a platen mounted thereon, a wheel having cam projections for urging the carriage toward the type-wheel, and ratchet mechanism for imparting intermittent rotary movement to said wheel.

811,248. **MAGNETIC SHIELD.** GEORGE H. SABINGTON, Rochester, N. Y., assignor to Durand, Loeb, Stagmaier Co., Rochester, N. Y. Filed Aug. 24, 1905. Serial No. 275,212.

Claim.—1. A magnetic needle, comprising an elongated substantially tubular body having a bearing, the walls of said body being magnetized, and a post-receiving opening alined with said bearing.



2. A magnetic needle, comprising an elongated, substantially tubular body, the walls of which are magnetized, and a jewel-mounting located in the upper side of the body between the ends thereof.

3. A magnetic needle, comprising a tubular body having pointed ends and having its walls magnetized, an opening in its lower side to permit the passage of a supporting-post, and a bearing-mounting in its upper wall directly above the opening.

4. A magnetic needle, comprising an elongated substantially tubular body, the walls of said body being magnetized, a bearing carried by the body between its ends, and a supporting-post engaging the bearing and constituting a pivot on which said bearing and the body turn.

5. A magnetic needle, comprising an elongated, tubular body oblong in cross-section and having an opening in its under side for the passage of a supporting-post, the walls of said tubular body being magnetized, and a jewel-mounting located in its upper wall in line with said opening.

6. A magnetic needle, comprising an elongated, tubular body elliptical in cross-section and having an opening in its under side for the passage of a supporting-post, the walls of said tubular body being magnetized, and a jewel-mounting located in its upper wall in line with said opening.

7. A magnetic needle, comprising an open-ended tubular body substantially elliptical in cross-section and having pointed ends, the walls of said tubular body being magnetized, an opening in its under side, and a jewel-mounting secured in its upper wall in line with the opening.

8. A magnetic needle, comprising a tubular, magnetized body having a pointed end, openings in its upper and lower sides, a jewel-holding collar fixed in the upper opening, and a jewel secured in said collar and having a bearing-receiving seat in its under side.

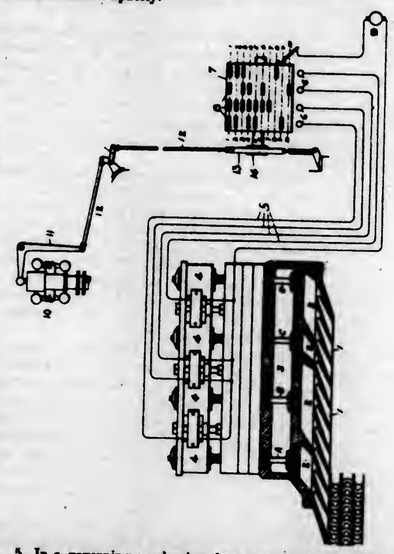
811,249. GOVERNING MECHANISM FOR ELASTIC-FLUID TURBINES. FREDERICK SAMUELSON, Rugby, England, assignor to General Electric Company, a Corporation of New York. Filed Mar. 23, 1905. Serial No. 251,509.

Claim.—1. In a governing mechanism for an elastic-fluid turbine, the combination of a number of discharge-passages having different capacities, individual valves for controlling the passage of fluid therethrough and a means for effecting different combinations of the valves to compensate for different loads on the turbines.

2. In a governing mechanism for elastic-fluid turbines, the combination of an admission-passage which is divided into sections having dissimilar capacities, individual and similarly-weighted valves for controlling the passage of fluid through said sections, and a means responsive to speed variations for effecting different combinations of the valves to compensate for different loads on the turbines.

3. In a governing mechanism for elastic-fluid turbines, the combination of an admission-passage which is divided into sections having dissimilar carrying capacities, individual valves for controlling the passage of fluid therethrough, a regulator which opens and closes the valves in a predetermined order as it moves from the initial to the final position to gradually increase the supply of motive fluid delivered to the wheel, and a device responsive to load changes for moving the regulator.

4. In a governing mechanism for an elastic-fluid turbine, the combination of a number of discharge-passages having different capacities, individual valves for controlling the passage of fluid therethrough a means for effecting different combinations of the valves and means for regulating the supply of fluid through a passage having the smallest capacity.



5. In a governing mechanism for an elastic-fluid turbine, the combination of a number of discharge-passages having different capacities individual valves for controlling the passage of fluid therethrough a means for effecting different combinations of the valves and a throttle-valve acting on the fluid supplied to a passage having the smallest capacity.

6. In a governing mechanism for an elastic-fluid turbine the combination of a number of discharge-passages having different capacities, individual valves for controlling the passage of fluid therethrough a regulator constructed and arranged so as to cause the opening and closing of the valves in predetermined groups, each group including a valve controlling a passage of the minimum capacity and a throttle for regulating the discharge of fluid through said passage.

7. In a governing mechanism for an elastic-fluid turbine, the combination of a number of discharge-passages having different capacities, separate valves controlling said passages, a regulator constructed and arranged to cause the opening and closing of said valves in predetermined groups, a throttle-valve acting upon the fluid supplied to a passage of minimum capacity and speed-responsive mechanism acting upon said regulator and throttle-valve.

8. In a governing mechanism for elastic-fluid turbines, the combination of an admission-passage which is divided into sections having dissimilar carrying capacities, individual valves for controlling the passage of fluid therethrough, a regulator constructed and arranged to first open the valve of the passage having the least capacity, then open the valve of the passage having the next greater capacity and close the first, and so on until each valve has been in service, and finally to group valves in a manner to further increase the supply of fluid to the turbine to the maximum, and a speed-regulating device for moving the regulator.

9. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles of different carrying capacities, of a separate valve for each group, and means for opening and closing said valves in such order that the successive quantities of elastic fluid delivered shall increase by regular increments measured by the capacity of the smallest nozzle.

10. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles of different carrying capacities, of a separate valve for each group, and means for opening and closing said valves in such order that the successive quantities of elastic fluid delivered shall increase by regular increments, measured by the reciprocal of the total number of nozzles, from zero up to the total nozzle capacity.

11. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles whose cross-sectional areas vary by multiples of a given constant, of a separate valve for each group, and means for opening and closing said valves singly and in combination in order to utilize one or more groups of nozzles to deliver quantities of elastic fluid successively increasing by multiples of the reciprocal of the total number of nozzles.

12. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles of different carrying capacities arranged side by side, of a separate valve for each group, and means for opening and closing said valves in such a predetermined order that the varying quantity of elastic fluid thereby delivered shall flow from nozzles that are adjacent.

13. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles of different carrying capacities, of a separate valve for each group, and means for opening said valves both singly and in combinations of two or more, whereby the quantities of elastic fluid delivered will increase in the arithmetical progression of a unit equal to the capacity of the smallest group.

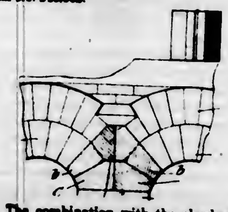
14. In a governing mechanism for an elastic-fluid turbine, the combination with groups of nozzles of different carrying capacities of a separate valve for each group, means responsive to changes in the load on the turbine, and operative connections whereby said means causes the opening and closing of said valves in order that said nozzles shall deliver quantities of elastic fluid successively increasing or decreasing by multiples of the reciprocal of the total number of nozzles.

811,250. CUSHION-FORK FOR MOTOR-CYCLES AND OTHER VEHICLES. WILLIAM G. SCHAEFFER, Reading, Pa., assignor to William F. Rompple, Reading, Pa. Filed May 19, 1905. Serial No. 261,169.

Claim.—1. The combination with a fork-stem having a T-shaped fork-connecting end, of a fork having a U-shaped crown which is pivoted at its spread ends to one arm of said T-shaped end and the bend of which overlies the other arm thereof and has a spring connection to the latter.

2. The combination with a fork-stem having a T-shaped fork-connecting end, of a fork having a U-shaped crown which is pivoted at its spread ends to one arm of said T-shaped end by means of a horizontal pivot-bolt, and the bend of which overlies the other arm thereof and is yieldingly connected to the latter by means of a vertical bolt having reversely-acting springs thereon, means for adjusting the tension of said springs, and a casing, substantially as set forth.

811,251. ARCH. REINHOLD SCHNEIDER, Sharon, Pa. Filed Feb. 17, 1905. Serial No. 246,062.



Claim.—1. The combination with the checker-work of a furnace, of a supporting-arch beneath the same, a second protecting-arch beneath the first arch, a separate set of blocks abutting against the base of each arch, and a column supporting said blocks, substantially as described.

2. In combination, a pair of superimposed arches, a plurality of blocks supporting the base of the lower arch and blocks supporting the base of the upper arch and breaking joints with the blocks which support the bases of the lower arch, substantially as described.

811,252. FUSE FOR PROJECTILES. HENRY C. SIMSON, West Kensington, England. Filed July 7, 1905. Serial No. 268,623.

Claim.—1. In a fuse, the combination of a hollow case provided with perforations through which the powder-gases can pass and a compressible cup inside the case exposed to the pressure of the gases and normally holding the parts in place.

2. The combination of a fuse-body having a conical hole in it, a conical plug fitting the hole, a compressible cup normally preventing the rearward movement of the conical plug, a perforated plug abutting against the cup, a firing-pellet and a connection between the pellet and the conical plug whereby the pellet is prevented from moving forward until the conical plug has moved rearward.

3. The combination of a fuse-body having a conical hole in it, a conical plug fitting the hole, a compressible cup normally preventing the rearward movement of the conical plug, a perforated plug abutting against the cup, a firing-pellet, a stem fixed to the pellet and having around it a circumferential groove, a partition fixed in the body and having through it a hole for the passage of the stem, a cup fixed to the end of the conical plug and balls in the groove and surrounded by this cup and abutting against the partition.

4. The combination of a fuse-body having a conical hole in it, a conical plug fitting the hole, a pressure-plate abutting against the plug, a compressible cup abutting against the pressure-plate and normally preventing the rearward movement of the conical plug, a perforated plug abutting against the cup, a firing-pellet, and a connection between the pellet and the conical plug whereby the pellet is prevented from moving forward until the conical plug has moved rearward.

5. The combination of a fuse-body having a conical hole in it, a conical plug fitting the hole, a pressure-plate abutting against the plug, a compressible cup abutting against the pressure-plate and normally preventing the rearward movement of the conical plug, a perforated plug abutting against the cup, a firing-pellet, a stem fixed to the pellet and having around it a circumferential groove, a partition fixed in the body and having through it a hole for the passage of the stem, a cup fixed to the end of the conical plug, and balls in the groove and surrounded by this cup and abutting against the partition.

811,253. SOCKET FOR INCANDESCENT ELECTRIC LAMPS. ALBERT P. SEYMOUR, Syracuse, N. Y., assignor to Pass & Seymour, Incorporated, Solvay, N. Y., a Corporation of New York. Filed Jan. 30, 1905. Serial No. 243,273.

Claim.—1. In an incandescent-lamp socket, the combination with the base composed of two porcelain blocks having cavities on their adjacent surfaces, forming a vertically-elongated sparking-chamber inclosed within the base, and having apertures for the connecting-screws, of lamp-terminals arranged on the lower surface of the lower block, elongated contact-springs arranged in the arcing chamber having upwardly-extending bends and downwardly-extending tips extending into apertures adjacent to the integral contact-pieces, wire terminals secured in recesses on the upper block and extending into recesses on the lower block, means for securing the wires to the wire terminals and for connecting the wire terminals to the respective springs, a rotating shaft journaled between the blocks, a porcelain cam arranged between the springs and loosely mounted on said shaft to be turned thereby, an inclosing case for the base composed of a cap and shell, insulating-linings for the cap and shell, and means to connect the cap to the shell, securely to inclose the base.

2. In an incandescent-lamp socket, the combination with a base composed of upper and lower porcelain blocks having corresponding cavities on their juxtaposed surfaces, forming an arcing chamber, and with apertures for the securing-screws, the upper block being formed with side recesses, shoulders in said recesses and wire grooves in its top and sides communicating with the recesses, and

both blocks formed on their outer surfaces with registering, longitudinal channels having enlarged screw-slots at their upper ends, of lamp-terminals secured on the lower surface of the lower block, wire terminals arranged on the shoulders in said side recesses, contact-springs supported on said shoulders and arranged in the arcing chamber with their lower ends extending into apertures adjacent to the respective contact-pieces, screws connecting and securing in position on said shoulders the respective wire terminals and contact-springs, a shaft journaled between the blocks, and a cam of insulating material arranged between the contact-springs and loosely mounted on the shaft to be turned thereby.

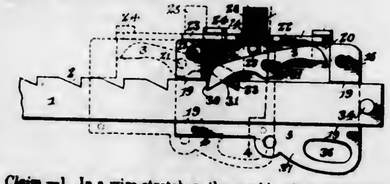
3. In an electric socket, the combination with a brass cap having in its margin inwardly upset portions provided with threaded bearings, of screws fitted to said bearings, a brass shell fitting within the cap-margin and provided with inwardly-grooved portions to fit over the bearings and with holes in the grooved portions freely to receive the screws, and of insulating portions arranged within the cap and shell and provided with holes adjacent to their upper margin to receive the screw-tips.

4. An inclosing shell for a device of the character described, having in combination a metallic cap having marginal portions inwardly upset and threaded, of screws fitted thereto, and a metallic shell fitting within the cap and having marginal holes to receive the screw ends.

5. In an incandescent-lamp socket, the combination with a base composed of two porcelain blocks, of lamp-terminals on the lower block, wire terminals on the upper block, secured in opposite recesses on the sides thereof and having their tips extending down into registering recesses on the lower block, means to secure the blocks together, a brass cap and a brass shell to inclose the base, screws to secure the cap to the shell, both blocks having on their side faces registering longitudinal channels to receive said screw-tips.

6. In an incandescent-lamp socket, the combination with a base composed of two porcelain blocks, of lamp-terminals on the lower block, wire terminals on the upper block, connections between the respective lamp-terminals and the respective wire terminals, means to secure the blocks together, a metallic cap and a metallic shell to inclose the base, and screws to secure the cap to the shell, both blocks having on their outer edges, registering, longitudinal channels having enlarged screw-slots at their upper ends to receive the tips of said screws.

811,254. WIRE-STRETCHER. ARTHUR A. SMITH, Eagle Grove, Iowa. Filed June 20, 1905. Serial No. 266,163.



Claim.—1. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier slidable on the bar, a pawl or dog pivoted at an intermediate point to the carrier and arranged to engage the combined guide and ratchet-bar, and a yieldable device slidable on the carrier for engaging the pawl or dog at either side of the pivotal point.

2. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier slidable thereon, a pawl or dog pivoted to the carrier at an intermediate point and arranged to engage the said bar, a slide guided on the carrier, and yieldable means carried by the slide and arranged to engage the pawl or dog at either side of the pivotal point.

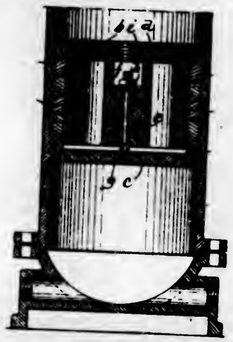
3. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier slidable on the bar, a pawl or dog pivoted at an intermediate point to the carrier and arranged to engage the said bar, and a yieldable device slidable on the carrier for engaging the pawl or dog at either side of the pivotal point, said yieldable device comprising a headed pin and a coiled spring disposed on the pin.

4. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier slidable on the bar, a pawl or dog pivoted at an intermediate point to the carrier and arranged to engage the said bar, a slide guided on the carrier and provided with a projection or stud having an opening extending inwardly from the inner face of the slide, a spring arranged within the said opening, and a pin also arranged in the opening of the stud and engaged by the spring, said pin being slidable on the pawl or dog and adapted to engage the same at either side of the pivot thereof.

5. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier slidable on the bar and provided with a casing having an opening, said casing being also provided with guides arranged over the opening, a slide fitted in the guides, and a yieldable device carried by the slide for engaging the pawl or dog.

6. In a wire-stretcher, the combination of a combined guide and ratchet-bar, a carrier mounted on the bar and provided with a casing receiving the bar and composed of two sides or pieces, said casing having an opening and provided with guides consisting of substantially L-shaped lugs extending inwardly and upwardly from the sides or pieces, a slide having reduced portions guided by the said lugs, and a yieldable device mounted on the slide for engaging the pawl or dog.

811,255. PISTON. GRANVILLE H. STALLMAN, Philadelphia, Pa. Filed Apr. 6, 1905. Serial No. 254,363.

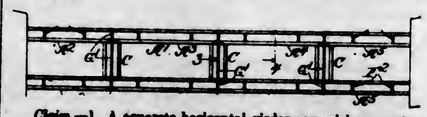


Claim.—In a piston, in combination, a main portion consisting of a head, sides, and a central web or hub, the latter of which is bored and drilled longitudinally, a plug for closing the upper end of the bored portion of said web or hub, a movable flanged head, a bolt secured to said head and passing through the drilled portion of said web, a head or nut on said bolt, and an elastic backing surrounding the main portion of said piston resting upon the flange of the movable head.

811,256. FUSIBLE LINK. ANDREW W. STOREY, Moston, near Manchester, England. Filed May 12, 1905. Serial No. 260,125.

Claim.—A fusible link comprising two parts, one consisting of a cylinder 1 having a tapered interior, a sensitive solder lining for said cylinder having its exterior tapered and having a screw-threaded bore and the other part consisting of a screw-threaded plug fitting the threaded lining, said second part having a projecting portion closing the end of the cylinder so as to completely cover the sensitive solder.

811,257. BRIDGE AND PROCESS OF MAKING THE SAME. JOSEPH B. STRAUS, Chicago, Ill. Filed Dec. 16, 1904. Serial No. 236,606.



Claim.—1. A concrete horizontal girder comprising a series of shell-like sections placed end to end and communicating with each other, said sections having concrete walls and a solid concrete core extending from one section to the other and binding them together into a rigid self-supporting structure.

2. A concrete bridge comprising a series of separated concrete ribs formed in sections and connected together, and a series of concrete lateral diaphragms separately made and fastened in position between said ribs.

3. A concrete structure comprising a series of separated concrete ribs formed in sections and connected together, and a series of concrete lateral diaphragms separately made and fastened in position between said ribs, said concrete lateral diaphragms fastened to the ribs at the points where the sections of the ribs are united.

4. A building-section comprising separated supporting-pieces, a series of looped connecting-pieces attached thereto at intervals, a concrete facing supported upon said supporting and connecting pieces so as to form a hollow shell-like section, the ends of the supporting-pieces left free from cement.

5. The combination in a bridge of a series of sections made up of separated supporting-pieces and looped connections embedded in concrete so as to form shell-like sections and connected together in proper relation so as to form the outline of the structure, adapted when filled in to form a solid unitary construction.

6. The combination in a bridge of a series of ribs made up of sections each consisting of separated supporting-pieces and looped connections embedded in concrete so as to form shell-like sections and connected together in proper relation so as to form continuous ribs, and a series of cross-pieces or diaphragms connected to said ribs at intervals.

7. The combination in a bridge of a series of ribs made up of sections each consisting of separated supporting-pieces and looped connections embedded in concrete so as to form shell-like sections and connected together in proper relation so as to form continuous ribs, and a series of cross-pieces or diaphragms connected to said ribs at the points where the sections of the ribs are united.

8. The combination in a bridge of a series of ribs made up of sections each consisting of separated supporting-pieces and looped connections embedded in concrete so as to form shell-like sections and connected together in proper relation so as to form continuous ribs, a series of cross-pieces or diaphragms connected to said ribs at the points where the sections of the ribs are united, and a connecting-piece extending through the ribs and the intermediate connecting-piece or diaphragm.

9. A building-section comprising a frame, a concrete facing supported upon said frame so as to form a hollow shell-like section, and overlapping connecting devices at the ends thereof for connecting said section in position in the structure and a uniting-piece passing through said overlapping devices so as unite them.

10. A bridge comprising a series of shell-like concrete sections fastened together so as to form separated ribs and lateral braces, and a solid uniting-core in the sections forming the ribs and running from one to the other so as to form solid ribs.

11. A bridge comprising a series of separated longitudinal ribs, a series of transverse ribs to act as cross-bracing, the two sets of ribs formed of a series of shell-like sections having concrete walls and fastened together, the sections of the longitudinal and transverse ribs provided with concrete filling which forms an integral construction extending longitudinally and transversely so as to unite the sections and form a solid rib construction.

12. A building-section comprising a rigid frame consisting of longitudinal and transverse pieces embedded in concrete and forming a hollow shell-like section, and intermediate connecting-pieces extending through the hollow of the section and fastened to the transverse pieces in the opposed walls thereof, said section adapted to be filled in after being placed in position so as to form a solid structure.

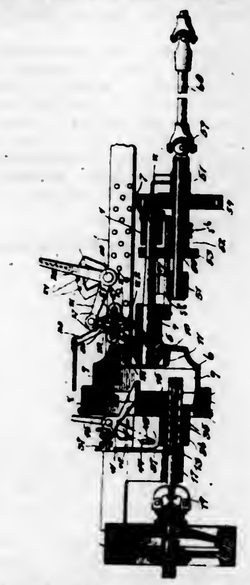
13. A concrete bridge comprising a series of shell-like ribs, a series of floor-pieces spanning the space between the adjacent edges of said ribs, said ribs filled with concrete which extends over the floor-pieces so as to form a floor integral with the filling in the ribs.

14. A concrete bridge comprising a series of shell-like ribs and cross-pieces, a series of floor-pieces spanning the space between the adjacent edges of said ribs, said ribs and cross-pieces filled with concrete which extends over the floor-pieces so as to form a floor integral with the filling in the ribs and cross-pieces.

15. The process of forming structures which consists in forming a series of hollow sections having a rigid frame embedded in concrete walls, then assembling said sections to form a series of shell-like ribs and cross-pieces, then supporting a series of floor-pieces on the inner edges of said ribs, and then filling in the ribs and covering the floor-pieces with concrete so as to form a floor integral with the filling in the ribs.

16. A concrete bridge comprising a series of concrete ribs and cross-pieces, and a series of concrete floor-pieces separate from the ribs and spanning the space between the ribs, and means for holding said floor-pieces in position.

811,258. POWER-TRANSMITTING MECHANISM. HORACE H. TAYLOR, San Jose, Cal. Filed Jan. 11, 1905. Serial No. 240,642.



Claim.—1. In a power-transmitting mechanism, the combination with a driving-gear having external and internal driving-faces, of a drum having an internal face adapted to be engaged by the external driving-face of the gear, and also an external face adapted to be engaged by the internal driving-face of the gear.

2. In a power-transmitting mechanism, the combination with a driving-gear having an external and an internal driving-face, of a drum having a plurality of internal faces each adapted to be engaged by the external driving-face of the gear, and also an external face adapted to be engaged by the internal driving-face of the gear-means for shifting the drum in a direction transversely to its axis and means for shifting the driving-gear longitudinally of its axis.

3. In a power-transmitting mechanism, the combination with a driving-gear having a peripheral driving-face, of a drum having a plurality of internal faces, each of which is adapted to be engaged by the peripheral driving-face of the driving-gear, a shaft on which the drum is secured, a hinged frame carrying bearings in which the shaft is journaled and means for raising and lowering the free end of the hinged frame.

4. In a power-transmitting mechanism, the combination with a driving-gear having a peripheral driving-face, of a drum having a plurality of internal faces, each of which is adapted to be engaged by the peripheral driving-face of the driving-gear, a shaft on which the drum is secured, a hinged frame carrying bearings in which the shaft is journaled, means for raising and lowering the free end of the hinged frame and means for moving the driving-gear longitudinally of its axis.

5. In a power-transmitting mechanism the combination with a driving-gear having a peripheral driving-face, of a drum having an internal face for engagement with the driving-face of the gear, means for raising the drum to bring its internal face into contact with the driving-face of the gear, and independently-operated means for varying the contact between the gear and the drum.

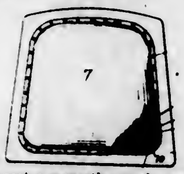
6. In a power-transmitting mechanism, the combination with a driving-gear having a peripheral driving-face, of a drum having an internal face, for engagement with the driving-face of the gear, means for raising the drum to bring its internal surface into contact with the driving-face of the gear, comprising a lever-arm and a connecting-link, and means for varying the effective length of the link to vary the contact between the gear and the drum.

7. In a power-transmitting mechanism, the combination with a driving-gear having a peripheral driving-face, of a drum having an internal face, for engagement with the driving-face of the gear, means for raising the drum to bring its internal face into contact

with the driving-face of the gear comprising a rock-shaft provided with an operating-lever and with a lever-arm and connecting-link, means for locking the operating-lever and means for varying the effective length of the link to vary the contact between the gear and drum.

8. In a power-transmitting mechanism, the combination with a driving-gear having a peripheral driving-face, of a drum having an internal face for engagement with the driving-face of the gear, means for raising the drum to bring its internal face into contact with the driving-surface of the gear comprising a rock-shaft provided with an operating-lever and with a lever-arm and connecting-link, the latter consisting of a pair of flexible arms, means for locking the operating-lever and means for spreading the flexible arms of the link to vary the contact between the gear and drum.

811,259. CHAIR-SEAT. VINCENT A. TAYLOR, Bedford, Ohio. Filed Mar. 31, 1905. Serial No. 253,677.



Claim.—1. In a seat, a supporting-section provided with peripheral projections through which securing means may pass, and spaces or openings between the projecting portions through which securing means for a covering portion may be passed, substantially as described.

2. In a seat, a supporting-section provided about its periphery with projections having holes therein adapted to receive securing means, and openings between said projections through which securing means for the superimposed parts may pass, substantially as described.

811,260. INSOLE. ARTHUR R. TERRELL, North Weymouth, Mass. Filed Dec. 24, 1902. Serial No. 49,576.

Claim.—1. An insole comprising a body portion having an integral upturned lip, a layer of flexible material having an upturned portion covering said lip, and fastenings extending through the lip close to the base thereof and through the covering layer, whereby the plurality of upturned integral portions secured together serve to reinforce or brace each other in upright position and are held in close contact below the point at which the needle of a welting or lasting machine penetrates the said upturned portions.

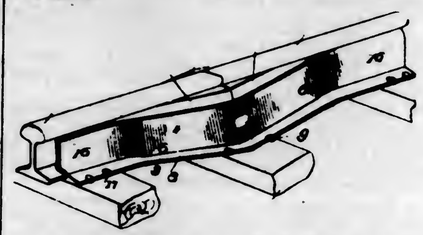
2. An insole comprising a leather body having an integral upturned lip, a fabric layer covering said body and extending over the edge of the lip, and means for holding the lip in proper upturned position, said means comprising a row of transverse fastenings extending through the lip close to the base thereof and through the fabric layer, whereby the plurality of upturned integral portions secured together serve to reinforce or brace each other in upright position and are held in close contact below the point at which the needle of a welting or lasting machine penetrates the said upturned portions.

811,261. RAIL-JOINT. JOHN W. TRACY, Nash county, N. C., assignor of one-half to John M. Fitzgerald, Rocky Mount, N. C. Filed May 8, 1905. Serial No. 259,269.

Claim.—1. In combination with the meeting ends of rails, joint means therefor including a wing at one side of the rails in spaced relation thereto, and spaced oppositely-movable wedges arranged between the wing and the rail ends for firmly holding the rails in position.

2. In combination with the meeting ends of rails, a joint therefor including a wing at a side of the rails in spaced relation thereto, oppositely-operating wedges between the wing and the rails, and means for imparting simultaneous longitudinal movement to said wedges.

3. In combination with the meeting ends of rails, a joint therefor including a wing at a side of the rails in spaced relation thereto, oppositely-operating wedges between the wing and the rails, and a member arranged transversely of the wedges for simultaneous actuation thereof.



4. In combination with the meeting ends of rails, a joint therefor including a wing at a side of the rails in spaced relation thereto, oppositely-operating wedges between the wing and the rails, and a tapered key movable between the wedges for separating the same.

5. In combination with the meeting ends of rails, a joint therefor comprising a chair, spaced wings carried by the chair and arranged upon opposite sides of the rails at the ends, oppositely-operating wedges between a wing of the chair and the adjacent rail ends, and means between said wedges for imparting simultaneous longitudinal movement thereto.

6. In combination with the meeting ends of rails, a joint therefor comprising a chair, spaced wings carried by the chair and arranged upon opposite sides of the rails at the ends, the space between the wing of the chair and the adjacent rails being convergent from a point between the ends of the chair toward the opposite extremities of the chair, and oppositely-movable wedges arranged for movement in the space between the aforesaid wing and the rails.

7. In combination with the meeting ends of rails, a joint therefor comprising a chair, spaced wings carried by the chair and arranged upon opposite sides of the rails at the ends, the space between the wing of the chair and the adjacent rails being convergent from a point between the ends of the chair toward the opposite extremities of the chair, oppositely-movable wedges arranged for movement in the space between the aforesaid wing and the rails, and a key passing between the rail ends for spreading the wedges simultaneously.

8. In combination with the meeting ends of rails, a joint therefor comprising a chair, spaced wings carried by the chair and arranged upon opposite sides of the rails at the ends, the space between the wing of the chair and the adjacent rails being convergent from a point between the ends of the chair toward the opposite extremities of the chair, oppositely-movable wedges arranged for movement in the space between the aforesaid wing and the rails, and a key passing between the rail ends for spreading the wedges simultaneously, the rail ends having notched or cut-away portions through which the key passes.

9. In combination with the meeting ends of rails, a joint therefor comprising a chair, spaced wings carried by the chair and arranged upon opposite sides of the rails at the ends, the space between the wing of the chair and the adjacent rails being convergent from a point between the ends of the chair toward the opposite extremities of the chair, oppositely-movable wedges arranged for movement in the space between the aforesaid wing and the rails, a key passing between the rail ends for spreading the wedges simultaneously, the rail ends having notched or cut-away portions through which the key passes, and a nut threaded upon the key for preventing displacement thereof.

10. In combination with the meeting ends of rails, a joint-chair therefor embodying a base and spaced wings carried by the base, wedges operating between a wing and the rails, and angle extensions projecting from the wings at the ends of the chair.

11. In combination with the meeting ends of rails, a joint-chair therefor embodying a base and spaced wings carried by the base, wedges operating between a wing and the rails, angle extensions projecting from the wings at the ends of the chair, a key passing through the wings of the chair and movable between the wedges for actuating the latter, and means for preventing displacement of said key.

811,262. RAILROAD-TIE. JOHN B. WALLING, Salt Lake City, Utah. Filed June 10, 1905. Serial No. 264,616.

Claim.—1. A railroad-tie comprising a body portion, a plate

disposed upon the body portion, said plate having vertical openings therein, members engaged in the openings and lying in pairs at opposite sides of the body portion and at opposite ends thereof, said members extending downwardly below the plate and having rail-engaging lips at their upper ends adapted for engagement with a rail disposed between the members, said members having registering horizontal passages in their downwardly-extending portions and co-operating wedge members engaged in the passages said members being disposed for operation to move the first-named members downwardly.

2. A railroad-tie comprising a plate, a support for the plate, members engaged in the plate for vertical movement and having co-operating lips adapted for engagement with a rail, said members having registering passages therein below the plate, upper and lower wedge members engaged in the passages, the lower wedge members having downwardly-directed portions extending over the surfaces of the first-named members below their passages, the upper wedge members resting upon the lower and against the under face of the plate and being movable inwardly to move the first-named members downwardly and means for holding the upper wedge members at different points of their movement.

3. The combination with a railroad-tie, of a plate disposed thereupon and extending laterally beyond the sides thereof, said plate having vertical openings in the laterally-extending portions, members slidably disposed in the openings and lying in pairs at opposite sides of the tie, the members of each pair having rail-engaging lips directed toward each other, a rail disposed upon the plate between the members of each pair and with its base-flange beneath the lips, means for moving the members downwardly to hold the rail in position and a spike engaged in the plate and in the tie beneath the rail.

4. In a railroad-tie the combination with a body portion, of a plate disposed thereupon, a spike engaged in the plate and in the body portion, a rail disposed upon the plate above the spike, said plate having vertical openings therein at opposite sides of the rail, rail-engaging members slidably engaged in the openings for vertical movement said members having alining passages therein below the plate, upper and lower wedge members disposed in the alining passages, the lower member having downwardly-extending portions lying outwardly of the first-named members to hold the lower wedge member against longitudinal movement, the upper wedge member being operable to move the rail-engaging members downwardly to clamp the rail in position.

811,268. FEED MECHANISM FOR QUILL-TREATING MACHINES. EDWARD K. WARREN, Three oaks, Mich. Filed May 13, 1905. Serial No. 260,676.

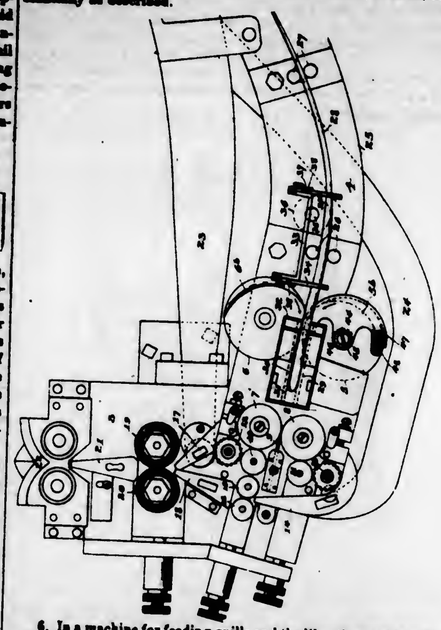
Claim.—1. In a machine for feeding quills and the like, the combination with a quill-holder, and a pair of feed-disks adapted to engage and advance between them said quills successively, of means serving to engage the quills successively and force them in proper succession into the nip of the feed-disks, substantially as described.

2. In a machine for feeding quills and the like, the combination with a quill-holder, and a pair of feed-disks, of means carried by one of said disks adapted to engage the nearest quill at each rotation of the disks and force it into the nip of the latter, substantially as described.

3. In a machine for feeding quills and the like, the combination with a holder adapted to support a stack of superposed quills, and a pair of feed-disks operating in a plane transverse to the plane of the stack, of means carried by one of said disks adapted to engage the nearest quill at each rotation of the disks, and force it to a position between said disks, substantially as described.

4. In a machine for feeding quills and the like, the combination with a holder adapted to support a stack of superposed quills, and a pair of feed-disks operating in a horizontal plane at the lower end of the stack, of means carried by one of said disks adapted to engage the quills as each occupies the lowermost position of the stack and depress it to a position between said disks, substantially as described.

5. In a machine for feeding quills and the like, the combination with a holder adapted to support a stack of superposed quills, and a pair of feed-disks operating in a plane transverse to the plane of the stack, of a cam-plate carried by one of said disks adapted to engage said quills successively and force the latter between the disks, substantially as described.



6. In a machine for feeding quills and the like, the combination with a holder adapted to support a stack of superposed quills, and a pair of feed-disks operating in a horizontal plane at the lower end of the stack, of a cam-plate carried by one of said disks adapted to engage each quill as it occupies the lowermost position of the stack and depress it to a position between said disks, substantially as described.

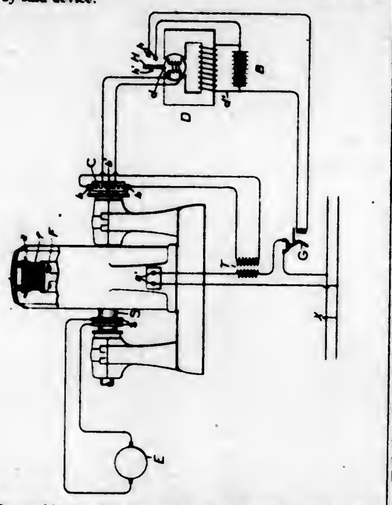
811,264. SIGN-HOLDER. HOWARD A. WATERHOUSE, Providence, R. I. Filed Mar. 1, 1904. Serial No. 196,971.

Claim.—1. The combination of a plurality of sign-holders, having the vertically-directed forearms E, each provided with a slot F for the reception of the removable and changeable sign-plate A, resting on base B of arms B E; and held in a perpendicular position by slots F, sign-plates A being secured by means of set-screws J, a collet C to said arms B, E, a spindle common to all of said sign-plates fitting in a recess in said collet, and means for securing said collet to said spindle to face said sign-plates to any point of the compass, all substantially as herein set forth.

2. The combination of arms B E, having a downwardly-extended neck or collet C provided with recess or aperture D, and the vertically-directed forearms E, each provided with a slot F; sign-plates A arranged to be removably supported upon arms B E in slots F, a spindle H adapted at its head to engage a recess or aperture D, in neck or collet C, to serve as supporting means for the whole, all substantially as herein set forth.

811,265. PROTECTION AGAINST REVERSAL OF ENERGY. LEONARD WILCOX, Pittsfield, Mass., assignor to Stanley Electric Manufacturing Company, Pittsfield, Mass., a Corporation of New Jersey. Filed May 2, 1904. Serial No. 206,269.

Claim.—1. In combination, a main alternating-current circuit, a local circuit in which the current varies in phase with variation of phase of the current in the main circuit, a commutator in said local circuit rotating synchronously with the cycles of the electromotive force of the main circuit, a device having relatively movable members and energized both by the commutated current in said local circuit and by a constant flux, and a switch in the main circuit controlled by said device.



2. In combination, a main alternating-current circuit, a local circuit in which the current varies in phase with variation of phase of the current in the main circuit, a commutator in said local circuit rotating synchronously with the cycles of the electromotive force of the main circuit, a device having relatively movable members, one of said members being energized by the commutated current in said local circuit and the other member being energized by a constant flux, and a switch in the main circuit controlled by said device.

3. In combination, an alternating-current dynamo-electric machine, a local circuit in which the current varies in phase with variation of phase of the current in said machine, a commutator in said local circuit rotating with the rotating member of said machine, a device having relatively movable members and energized both by the commutated current in said local circuit and by a constant flux, and a switch in the circuit of said machine controlled by said device.

4. In combination, an alternating-current dynamo-electric machine, a local circuit in which the current varies in phase with variation of phase of the current in said machine, a commutator in said local circuit rotating with the rotating member of said machine, a device having relatively movable members, one of said members being energized by the commutated current in said local circuit and the other being energized by a constant flux, and a switch in the circuit of said machine controlled by said device.

5. In combination, a main alternating-current circuit, a local circuit in which the current varies in phase with variation of phase of the current in the main circuit, a source of direct current, a device energized both by current from said local circuit and current from said source, a commutator adapted and arranged to commutate one of said currents and rotating synchronously and in phase with the electromotive force of the main circuit, and a switch in the main circuit controlled by said device.

6. In combination, an alternating-current dynamo-electric machine, a local circuit in which the current varies in phase with variation of phase of the current in said machine, a source of direct current, a device energized both by current from said local circuit and by current from said source, a commutator adapted and arranged to commutate one of said currents and rotating with the rotating member of said machine, and a switch in the circuit of said machine controlled by said device.

7. In combination, a main alternating-current circuit, a device energized by a constant flux, means for producing in said device a second flux reversible in direction when the current in the main circuit reverses in phase relative to the electromotive force, and a switch in said main circuit controlled by said device.

8. In combination, a main alternating-current circuit, a device energized by a constant flux, means for producing in said device a second flux reversible in direction when the current in the main circuit reverses in phase relative to the electromotive force and independent in strength of variation in current strength in the main circuit over wide ranges, and a switch in the main circuit controlled by said device.

9. In combination, a main alternating-current circuit, a local circuit in which the current varies in phase with variation of phase of the current in the main circuit and is independent in strength of variation in the main current strength over wide ranges, a source of direct current, a device energized both by current from said local circuit and current from said source, a commutator adapted and arranged to commutate one of said currents and rotating synchronously with the cycles of the electromotive force of the main circuit, and a switch in the main circuit controlled by said device.

10. In combination, a main alternating-current circuit, a local circuit in which the current varies in phase with variation of phase of the current in the main circuit and is independent in strength of the strength of the main current over wide ranges, a commutator in said local circuit rotating synchronously with the cycles of the electromotive force of the main circuit, a device having relatively movable members, one of said members being energized by the commutated current in said local circuit and the other member being energized by a constant flux, and a switch in the main circuit controlled by said device.

11. In combination, an alternating-current circuit, a series transformer having its primary included in said circuit and adapted to be saturated by a fraction of the normal current in said circuit, a source of direct current, a device energized both by current from the secondary of said transformer and by current from said source, a commutator adapted and arranged to commutate one of said currents and rotating synchronously with variation of phase of the electromotive force in said circuit, and a switch in said circuit controlled by said device.

12. In combination, an alternating-current dynamo-electric machine, a series transformer having its primary in series with said machine and adapted to be saturated by a fraction of the full-load current of said machine, a commutator connected to the secondary of said transformer and rotating with the rotating member of said machine, a device having relatively movable members, one of said members having a winding connected to said commutator and the other member being energized by a constant flux, and a switch in the circuit of said machine controlled by said device.

13. A device for protection against reversal of energy in an alternating-current circuit, comprising a member energized by a constant flux and a second member movable relatively to the first member and energized by a commutated current varying in phase with variation of phase of the current in said circuit, and a switch in said circuit controlled by said device.

14. A device for protection against reversal of energy in an alternating-current circuit comprising two windings, one energized from a direct-current source and the other from an alternating-current source in which the current varies in phase with variation of phase of the current in said circuit, means for commutating one of said currents, and a switch in said circuit controlled by said device.

15. A reverse-current cut-out for alternating-current circuits comprising a rectifier, and a polarized relay actuated by the rectified current.

16. A reverse-current cut-out for alternating-current circuits comprising a rectifier driven synchronously with the cycles of the electromotive force in said circuit, and a polarized relay actuated by the rectified current.

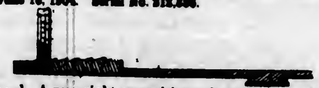
17. In combination, an alternating-current circuit, a rectifier in said circuit, a polarized relay supplied with current from said rectifier, and a circuit-breaker controlled by said relay.

18. In combination with an alternating-current circuit, a series transformer having its primary included in said circuit and having a core adapted to be saturated by a fraction of the full-load current in said circuit, a rectifier in circuit with the secondary of said transformer, a polarized relay supplied with current from said rectifier, and a circuit-breaker controlled by said relay.

811,266. HAY-FORK. ANTON ANDERSON and WILFORD B. PALMER, Grantsville, Utah. Filed Aug. 24, 1904. Serial No. 221,960.

Claim.—A fork comprising a head, a handle connected to said head, tines engaged through the head, eyes carried by the head, a bail engaged in the said eyes on the head and having an eye formed in its free end for the attachment of a hoisting-cable, a link including arms at one of its ends, said arms having their ends pivotally connected to the opposite inner sides of said bail near the upper end of the latter, the other end of said link being curved laterally, a second link having apertured lugs formed on each of its ends, the curved end of the first-named link being pivoted between the lugs of one of the ends of the last-named link, the other end of said last-named link being pivoted to the said handle, a pin carried by said first-named link and extending from each side thereof to engage the lugs of the last-named link, and a drop-pine connection formed on the pivot of the two links.

811,267. GUN-SIGHT. HERBERT B. AMBUS, Buffalo, Wyo. Filed June 16, 1904. Serial No. 212,886.



Claim.—1. A rear sight comprising a frame having a recess in one side, a sight-plate adjustable in said recess and having a sight-opening and vertically and laterally ranged graduations in the field thereof, a clamp-plate bearing against the sight-plate, and a screw to secure the sight-plate and clamp-plate in place, the said screw being clear of the sight-plate, to permit initial adjustment of the latter and being in engagement with the clamp-plate to hold the latter against movement with the sight-plate when the sight-plate is being adjusted.

2. In combination with a rear sight having a sight-opening and vertically and laterally ranged graduations in the field thereof, a front sight tapering in form forwardly to prevent its sides from coming in the range of vision when sight is taken from either side of the opening in the rear sight.

3. In combination with a rear sight having a sight-opening and vertically and laterally ranged graduations in the field thereof, a front sight tapering in form forwardly to prevent its sides from coming in the range of vision when sight is taken from either side of the opening in the rear sight, and having its rear end hollowed or recessed and formed with a flange defining the outline thereof.

811,268. FITTING-STAND FOR DRESSMAKERS, &c. JOHN J. BAIR, Lancaster, Pa. Filed Jan. 20, 1906. Serial No. 296,207.

Claim.—1. A fitting-stand comprising a main platform, a section which may be adjusted vertically in relation thereto, means for supporting said section firmly at all its sides, and means for effecting said adjustment, substantially as set forth.

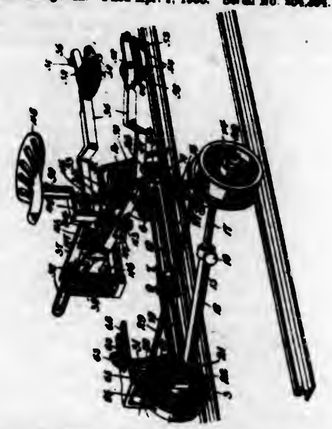
2. A fitting-stand comprising a platform mounted upon suitable supports and formed with a central aperture, an adjustable section mounted within said central aperture upon supports located near the edge thereof and on all sides thereof, and means for raising and lowering said supports to adjust said section, substantially as set forth.

3. A fitting-stand comprising a main platform, an adjustable section and a vertical flange extending up from the surface of the main platform adjacent to said adjustable section, substantially as set forth.

4. A fitting-stand comprising a fixed platform, an adjustable section for supporting the person to be fitted, means for adjusting the same, and vertical flanges or rings extending up from the top of said main platform adjacent to said adjustable section, substantially as set forth.

5. A fitting-stand comprising a main fixed platform formed with a central aperture, an adjustable platform mounted in said aperture and having cam-faced bars on its under side, sliding cams mounted upon a track beneath said bars, and a screw-rod provided with a crank mounted to engage with said sliding bars for operating the same back and forth, substantially as set forth.

811,269. FOLDABLE RAILWAY-VELOCIPEDE. HENRY BARRY, Chicago, Ill. Filed Apr. 7, 1905. Serial No. 254,804.



Claim.—1. In a device of the class described, the combination of a wheeled frame, propelling mechanism, and supporting means for the propelling mechanism, said supporting means being movable on the frame to permit the propelling mechanism to follow the contour of a rail.

2. In a device of the class described, the combination of a wheeled frame, propelling mechanism, and supporting means for the propelling mechanism, said supporting means being laterally movable on the frame to permit the propelling mechanism to follow the contour of a rail.

3. In a device of the class described, the combination of a wheeled frame, propelling mechanism, and supporting means for the propelling mechanism, said supporting means being pivotally mounted and arranged to swing horizontally to permit the propelling mechanism to follow the contour of a rail.

4. In a device of the class described, the combination of a wheeled frame, propelling mechanism, supporting means for the mechanism, said supporting means being movably mounted on the frame to permit the propelling mechanism to follow the contour of a rail, and means for guiding the propelling mechanism to retain the same in proper position with relation to the rail.

5. In a device of the class described, the combination of a wheeled frame, propelling mechanism, supporting means for the mechanism, said supporting means being movably mounted on the frame to permit the propelling mechanism to follow the contour of a rail, and a fork arranged to straddle the rail to retain the propelling mechanism in proper position with relation to the same.

6. In a device of the class described, the combination of a wheeled frame, propelling mechanism, supporting means for the propelling mechanism, said supporting means being movably mounted on the frame to permit the propelling mechanism to follow the contour of a rail, and means for locking the said supporting means rigid with the wheeled frame.

7. In a device of the class described, the combination of a wheeled frame, a pivoted frame mounted on the wheeled frame, propelling mechanism carried by the pivoted frame, and a fork connected with the pivoted frame and arranged to straddle a rail for guiding the propelling mechanism.

8. In a device of the class described, the combination of a wheeled frame, a pivotally-mounted frame or bracket arranged to swing horizontally, propelling mechanism carried by the pivoted frame or bracket, and a removable locking-pin engaging the pivotally-mounted frame and the wheeled frame and adapted to lock the former rigidly with the latter.

9. In a device of the class described, the combination of a combined oscillatory and reciprocatable push-bar fulcrumed at one

end and provided at the other end with track-engaging means, and actuating mechanism connected with the push-bar at an intermediate point.

10. In a device of the class described, the combination of a push-bar provided at one end with track-engaging means, means for slidably and pivotally mounting the other end of the push-bar, and actuating mechanism located at an intermediate point.

11. In a device of the class described, the combination of reversely-movable push-bars provided at one end with track-engaging means, means located at the other end of the push-bars for slidably and pivotally mounting the same, and a rotary element located at a point between the ends of the push-bars and eccentrically connected with the same.

12. In a device of the class described, the combination of reversely-movable push-bars provided at one end with track-engaging means, means located at the other end of the push-bars for slidably and pivotally mounting the same, and a crank-shaft having cranks connected with the push-bars between the ends thereof.

13. In a device of the class described, the combination of reversely-movable push-bars, means for slidably and pivotally mounting the same at a common point, and actuating mechanism for the push-bars.

14. In a device of the class described, the combination of reversely-movable push-bars slidably and pivotally mounted at the front, and a crank-shaft provided with cranks connected with the push-bars, said crank-shaft being also provided with pedal-cranks.

15. In a device of the class described, the combination of a push-bar, a pivoted shoe, a stop for limiting the movement of the shoe in one direction, and means for normally holding the shoe in engagement with the stop.

16. In a device of the class described, the combination of a push-bar, a shoe movably connected with the push-bar, and means for cushioning the shoe.

17. In a device of the class described, the combination of a push-bar, a shoe pivotally connected therewith, and a spring engaging the shoe and cushioning the same.

18. In a device of the class described, the combination of a push-bar, a shoe movably connected therewith, a slidable rod extending from the shoe, and a coiled spring disposed on the rod and cushioning the shoe.

19. In a device of the class described, the combination of a push-bar, a track-engaging shoe pivotally mounted on the push-bar, a stop for limiting the movement of the shoe, and yieldable means for holding the shoe at the limit of its movement forming a cushion.

20. In a device of the class described, the combination of a push-bar, a pivoted shoe, a stop located at one side of the pivot for limiting the movement of the shoe, and yieldable means located at the opposite side of the pivot for forming a cushion.

21. In a device of the class described, the combination of a shoe having a curved engaging face, and cushions arranged at intervals at the curved face, and means for operating the shoe.

22. In a device of the class described, the combination of a shoe having a curved engaging face, yieldable buttons or protuberances extending from the shoe, and means for operating the latter.

23. In a device of the class described, the combination of a shoe, and means for moving the same backward and forward and for raising and lowering the shoe, said means embodying crank mechanism and a push-bar.

24. In a device of the class described, the combination of reversely-movable shoes, and means for moving the shoes backward and forward and for raising and lowering the same, said means embodying push-bars and a crank-shaft connected with the push-bars.

25. In a device of the class described, the combination of standards, adjustable means for connecting the standards, wheels connected with the standards and arranged to run on one of the rails of a track, transverse connections extending from the standards, and a wheel arranged to run on the other rail and mounted on the said transverse connections.

26. In a device of the class described, the combination of standards, a lower bar connecting the standards and composed of adjustably-connected sections, wheels connected with the standards and arranged to run on one of th rails of a track, transverse connections extending from the standards, and a wheel arranged to run on the other rail and mounted on the transverse connections.

27. In a device of the class described, the combination of standards, a lower bar connecting the standards and having slotted overlapped portions adjustably secured together, wheels connected with the standards and arranged to run on one of the rails of a track, transverse connections extending from the standards, and a wheel carried by such connections.

28. In a device of the class described, the combination of standards, a bottom bar connecting the standards and composed of sections movable on each other to fold the device, wheels connected with the standards and arranged to run on one of the rails of a track, foldable transverse connections extending from the standards toward the other rail of the track, and a wheel carried by the foldable connections.

29. In a device of the class described, the combination of a foldable wheeled frame, and propelling mechanism having a foldable push-bar.

30. In a device of the class described, the combination of a wheeled frame, and propelling mechanism having a push-bar composed of foldable sections hinged together and provided with means for holding the sections in operative relation.

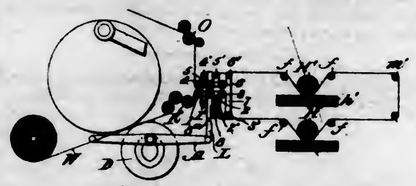
31. In a device of the class described, the combination of a frame having front and rear wheels, a seat, propelling mechanism located adjacent to the seat, and a brake-lever having angularly-related arms and arranged to engage the front wheel, one of the arms being connected with the frame, and the other being arranged to be engaged by the foot.

32. In a device of the class described, the combination of a frame having front and rear wheels, a seat, propelling mechanism located adjacent to the seat, and a brake-lever having angularly-related arms and provided at the angle formed by the arms with a shoe for engaging the front wheel.

33. In a device of the class described, the combination of a frame having front and rear wheels, a seat, propelling mechanism located adjacent to the seat, a brake-lever having angularly-related arms, one of the arms being arranged to be engaged by the foot, and the other arm being pivoted between its ends, and a spring engaging the pivoted arm.

34. In a device of the class described, the combination of a frame provided with standards having a slotted plate or extension, a wheel arranged between the standards, and a brake-lever also mounted between the standards and having an operating-arm projecting through the slotted plate or extension.

811,270. **WEB-LOOPING MECHANISM.** HENRY F. BECHMAN, Battlecreek, Mich., assignor to The Duplex Printing Press Company, Battlecreek, Mich. Filed Nov. 21, 1904. Serial No. 233,690.



Claim.—1. In a web-looping mechanism, the combination of a plurality of pairs of oppositely-moving rollers each pair of rollers cooperating to form a loop in the web, the web being directed over and under opposite rollers in alternation and means for operating said rollers.

2. The combination with web-feeding mechanism of two adjacent sets of web-rollers movable in opposite directions, the web being directed over and under the oppositely-moving rollers in alternation to form loops in the web, substantially as described.

3. The combination of two adjacent series of web-rollers, the web being passed alternately over and under the successive rollers in each set; with means for simultaneously moving the sets of rollers in opposite directions to form loops in the web, substantially as described.

4. In a web-manipulating mechanism, the combination of oppositely-moving devices, adjacent looping-rollers respectively mounted on said devices, the web being directed over said rollers in alternation, the opposite looping-rollers coacting to form a loop in the web, substantially as described.

5. In a web-manipulating mechanism, the combination of oppositely-moving devices, a plurality of pairs of looping-rollers mounted on said devices, each pair of oppositely-moving rollers coacting to take up or give out a loop of web, and means for operating said devices.

6. In combination means for feeding and delivering a web, a web-looping mechanism intermediate the feed and delivery devices, comprising oppositely-moving rollers, coacting to alternately take up and give off a loop of web the web being directed over and under the opposite rollers in alternation, substantially as described.

7. In combination a movable support, a looping-roller thereon, an adjacent movable support, a looping-roller thereon, and means whereby one support moves the other in an opposite direction, said looping-rollers coacting to form a loop in the web, substantially as described.

8. In combination two looping-rollers mounted on a movable support, two other looping-rollers coacting with the first-mentioned looping-rollers to form loops in the web and mounted on a second movable support; with means for moving the said supports simultaneously but in opposite directions, for the purpose and substantially as described.

9. In combination web-feeding-in devices and web-delivery devices; with web-looping mechanism intermediate the feed and delivery devices, comprising two looping-rollers mounted on a movable support, and two other adjacent looping-rollers mounted on another adjacent movable support and cooperating with the first-mentioned rollers to form loops in the web, and means for simultaneously moving said supports in opposite directions, substantially as described.

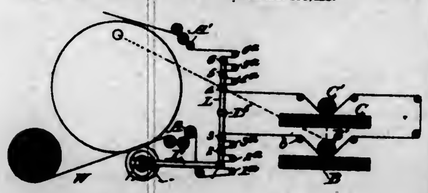
10. In combination means for feeding and delivering a web, a web-looping mechanism intermediate the feed and delivery, comprising two sets of oppositely-moving rollers, one set taking up loops in the web while the other set gives out loops, the sets taking up and giving off loops in alternation, substantially as described.

11. In combination a movable support, web-looping rollers mounted thereon, an adjacent movable support, web-looping rollers mounted thereon, means for operating one support, and means whereby one support moves the other, but in an opposite direction, for the purpose and substantially as described.

12. In combination two sets of looping-rollers mounted on a common support, two sets of looping-rollers coacting with the first-mentioned sets of looping-rollers, and mounted on another common support; with means for moving the supports of the first and second sets of looping-rollers simultaneously but in opposite directions, for the purpose and substantially as described.

13. The herein-described web-looping mechanism comprising two sets of looping-rollers mounted on a common movable support, and two other sets of looping-rollers mounted on another common movable support, and means for simultaneously moving said supports in opposite directions, each set of looping-rollers on one support coöperating with the adjacent set of looping-rollers on the other support, for the purpose and substantially as described.

811,271. **WEB-LOOPING MECHANISM.** HENRY F. BECHMAN, Battlecreek, Mich., assignor to Duplex Printing Press Company, Battlecreek, Mich. Filed Jan. 3, 1905. Serial No. 239,493.



Claim.—1. In combination, web feeding and delivery devices, and two sets of movable web-looping devices and an oscillating support therefor, each set comprising a plurality of loopers moving oppositely to the other—said sets being mounted on opposite sides of the fulcrum of the support, and one set of looping devices acting to form loops in the web while the other set of devices is giving out loops.

2. In combination an oscillating support, two sets of web-looping devices mounted on said support respectively at opposite sides of its fulcrum, each set comprising a series of parallel rollers successively nearer the fulcrum of the support.

3. In combination with an oscillating support, sets of web-looping devices mounted on said support at opposite sides of its fulcrum, each set of devices comprising a plurality of parallel loopers adapted to simultaneously form loops in the web or to simultaneously give out such loops, adjacent sets of relatively fixed rollers opposite the sets of movable loopers, and means for oscillating said support.

4. In a web-printing machine, the combination of web feeding and delivering devices, and web-printing mechanism intermediate the feed and delivery comprising stationary beds and coacting cylinders; with a vertically-disposed oscillating support located between the feeding and delivery devices and the printing mechanism, a plurality of web-looping devices mounted on one end of said support between the feed and printing mechanisms, a plurality of web-looping devices mounted on the opposite end of said support between the printing and delivery mechanisms, and a plurality of stationary web-guides coöperating with said looping devices, substantially as described.

5. In a web-printing machine, the combination of web feeding and delivering devices, and web-printing mechanism intermediate the feed and delivery; with a pair of oscillating supports between the feeding and delivering devices and the printing mechanism, a plurality of web-looping devices mounted on one end of said supports between the feed and printing mechanisms; an adjacent set of stationary web-guides coacting with said loopers; a plurality of web-looping devices mounted on the opposite end of said supports between the printing and delivery mechanisms, and an adjacent set of stationary web-guides coacting with said loopers; each set of movable loopers being adapted to simultaneously form or give out loops in the web, and one set of movable looping devices operating oppositely to the other, all substantially as described.

811,272. **FOUNTAIN-BRUSH.** GILBERT L. BELCHER, Oakland, Cal. Filed Oct. 26, 1904. Serial No. 230,122.

Claim.—1. A fountain-brush comprising a tubular handle, a socket provided with bristles, and a follower reciprocable in the handle said handle being of compressible material capable of resuming its original tubular form on the release of pressure.

2. A fountain-brush having in combination a tubular handle, a socket connected to the handle and provided with bristles, and a spherical forcing device contained within the chamber of the handle, for supplying the contents of the latter to the bristles, said handle composed of flexible material whereby it is capable of resuming a normal tubular form behind the follower on the release of pressure.

3. A fountain-brush having in combination a hollow handle portion capable of automatically resuming a normal tubular form after compression, a socket having bristles communicating with the chamber of the handle, a spherical forcing device operable in the handle to supply the contents thereof to the bristles, and means for venting the portion of the handle back of the forcing device.

4. A fountain-brush comprising a flexible tubular part, a follower contained in said part and of greater external diameter than the normal interior diameter of the tubular part and a brush connected with the latter.

5. A fountain-brush comprising a handle portion of compressible elastic material, a follower of larger diameter than the normal bore of the handle and a brush secured to said handle and having a central opening communicating with the interior of the handle.

6. A fountain-brush comprising a handle of collapsible material capable of automatic expansion after compression and having a rigid screw-threaded part at one end for the attachment of a brush, a removable brush-socket fitting said screw-threaded part, a brush carried by said socket and having a passage-way communicating with the interior of the handle and a follower reciprocal in the handle and having a diameter greater than the normal interior diameter of the handle.

811,278. **HEATER.** WILLIAM H. BROWN, Indianapolis, Ind. Filed Feb. 13, 1905. Serial No. 245,628.

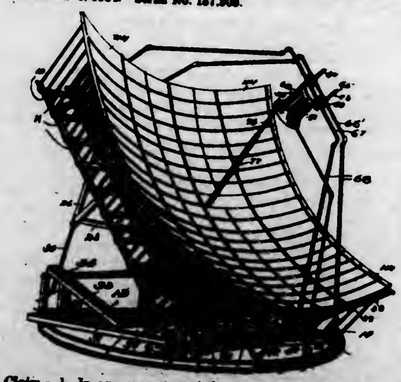
Claim.—1. The combination, in a heater, of the inclosing structure, a gas-burner in the lower part of said structure, a multiplicity of heat absorbing and transmitting members arranged in vertical planes above said burner whereby a series of unobstructed flues for the ascending current from the burning gas is provided, said structure being provided with an open space below said members into which the air will pass and an open space above said members leading into the room through which said air will be discharged after being heated, all substantially as shown and described.

2. The combination, in a heater, of the inclosing structure, a gas-burner arranged in the lower portion of said structure, a multiplicity of heat absorbing and transmitting members arranged in vertical planes above said burner, said inclosing structure being provided with air ingress and egress openings below and above said members, and a projecting ledge at the upper side of the egress-opening extending out from the structure whereby the air when heated is directed outwardly into the room, all substantially as shown and described.

3. The combination, in a heater, of the inclosing structure, a gas-burner arranged in the lower portion of said structure, heat absorbing and transmitting plates arranged vertically within the structure above the gas-burner, rods passing through said plates whereby they are supported, distance-washers arranged on said rods between said plates whereby they are held the predetermined distance apart, said inclosing structure being provided with suitable openings in its lower and upper portions for the admission and discharge of the air, and an ornamental plate in the front of said structure forming the closing-wall between said openings.

4. The combination, in a heater, of the inclosing structure, a gas-burner arranged in the lower portion of said structure, heat absorbing and transmitting plates arranged vertically within the structure above the gas-burner, rods passing through said plates whereby they are supported, and distance-washers arranged on said rods between said plates whereby they are held the predetermined distance apart, said inclosing structure being provided with suitable openings in its lower and upper portions for the admission and discharge of the air.

811,274. **SOLAR FURNACE.** ALBERT CASTEL, Los Angeles, Cal., assignor to Solar Furnace and Power Co., a Corporation of Arizona. Filed Jan. 6, 1904. Serial No. 187,909.



Claim.—1. In an apparatus of the class described, the combination with a main frame including longitudinal and transverse members, of a concaved supplemental frame including longitudinal and transverse arc-shaped members corresponding to and lying respectively above the longitudinal and transverse members of the main frame, bolts passed through both members of the supplemental frame and through the main frame and provided with clamping-nuts, and sleeves of varying lengths inclosing the bolts and resting with their ends against the supplemental and main frames respectively.

2. In an apparatus of the class described, the combination with a main frame including longitudinal and transverse members, of a concaved supplemental frame including longitudinal and transverse arc-shaped members, concaved mirror-sections disposed between said transverse and longitudinal arc-shaped members, supporting means engaged through said arc-shaped members and with the first-named frame, parallel supporting members connected with the first-named frame and held in spaced relation to the concaved side of the mirror, a boiler, and arms extending from the boiler between said supporting members and adjustably connected therewith for movement of the boiler toward and away from the mirror.

3. In an apparatus of the class described, the combination with a concaved reflector, of a boiler disposed to receive the rays from the reflector, the surface of said boiler exposed to said rays being convex and substantially parallel with the reflector and having radiating projections.

4. In an apparatus of the class described, the combination with a reflector, of a boiler disposed to receive the rays from the reflector, the surface of said boiler exposed to said rays having projections in the direction of the reflector.

5. In an apparatus of the class described, the combination with a reflector, of a boiler disposed to receive rays from the reflector, said boiler having a pipe-coil within the inclosure of which said rays are received against the boiler, said coil being in communication with the boiler.

6. In an apparatus of the class described, the combination with a reflector, of a boiler disposed to receive rays from the reflector, a pipe-coil connected with the boiler and within the inclosure of which the reflected rays are received and a check-valve between the pipe-coil and the boiler.

7. In an apparatus of the class described, the combination with a concaved reflector, of a boiler having a convex surface disposed to receive the reflected rays from the reflector and having projections radiating from its convex face, and a pipe-coil connected to the boiler and surrounding said projections.

8. In an apparatus of the class described, the combination with a reflector, of a boiler disposed to receive the rays from the reflector, the surface of said boiler exposed to said rays having projections in the direction of the reflector, and means projecting from the boiler in the direction of the reflector and encircling said projections, for confining the heated zone.

811,275. **DREDGING APPARATUS.** JAMES P. COLE, Chicago, Ill. Filed May 26, 1905. Serial No. 262,314.

Claim.—1. In dredging apparatus, the combination of a gangue tube, or duct, an air-jet and a water-jet, said jets discharging their respective fluids so they will commingle before the fluids are discharged into the gangue-duct.

2. In dredging apparatus, the combination of a gangue tube or duct, an air-jet and a water-jet, and comprising a mixing-chamber wherein the fluids from said jets are combined prior to the discharge into the gangue-duct.

3. In dredging apparatus, the combination of a gangue tube or duct, an air-jet and a water-jet, said air-jet discharging its fluid into the water stream so the fluids will be mechanically combined before discharge thereof into the gangue-duct.

4. In dredging apparatus, the combination of a gangue tube or duct, a head at the lower end of said tube or duct and provided with intakes, an air-jet in said head, and a water-jet in said head, said air-jet discharging into the water column so the fluids will be combined prior to being discharged under pressure into the gangue-duct.

5. In dredging apparatus, the combination of a gangue tube or duct, a duct for water, and an upwardly-extending nozzle through which water from said duct is forced, and an air-jet discharging into said nozzle.

6. In dredging apparatus, the combination of a gangue-tube, a lifting-jet, an air-jet, a head at the lower end of said gangue-tube, and a centrally-arranged downwardly-discharging pilot-jet at the lower end of said head.

7. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said gangue-tube, a centrally-arranged, downwardly-discharging pilot-jet at the lower end of said head, a water-jet discharging into the gangue-duct, and an air-jet discharging into said water-jet.

8. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said gangue-tube, a centrally-arranged downwardly-discharging pilot-jet at the lower end of said head, a water-jet discharging into the gangue-duct, and an air-jet discharging its fluid to commingle with the water passing through the water-jet so the fluids will commingle before discharge into the gangue-duct.

9. In dredging apparatus, the combination of a gangue tube or duct, a head at the lower end of the gangue-tube and having a chamber in its upper portion in communication with the gangue-tube, water and air jets for supplying fluids to force the gangues upwardly in the tube, and a pilot-jet at the lower end of said head, and a duct in said head disposed at the side of said gangue-duct and communicating with the pilot-jet.

10. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said tube, a chamber near the lower end of said head, a pipe or duct for supplying water under pressure to said chamber, one or more cutter-jets leading outwardly from said chamber and water and air jets for forcing the gangue upwardly in the tube.

11. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said tube, a chamber near the lower end of said head, a pipe or duct for supplying water under pressure to said chamber, one or more cutter-jets leading outwardly from said chamber, water and air jets for forcing the gangue upwardly in the tube, and a centrally-disposed downwardly-discharging pilot-jet at the lower end of the head.

12. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said tube, a chamber near the lower end of said head, a pipe or duct for supplying water under pressure to said chamber, one or more cutter-jets leading outwardly from said chamber, water and air jets for forcing the gangue upwardly in the tube, a downwardly-discharging pilot-jet, and a separate duct leading to the pilot-jet.

13. In dredging apparatus, the combination of a gangue-tube, a head at the lower end of said tube, intakes in said head, a gangue-duct in said head, a water-jet and an air-jet, both discharging their fluids so they will commingle prior to discharge into the gangue-duct, the discharge of the mixed fluid being centrally arranged in the duct.

14. In dredging apparatus, the combination of a gangue-tube, a water-jet and an air-jet for forcing the gangue upwardly a separate pilot-jet, and valves whereby the lifting-jets and the pilot-jet can be separately controlled.

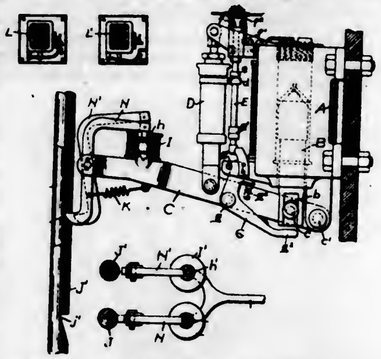
15. In dredging apparatus, the combination of a gangue-tube, a water-jet and an air-jet for forcing the gangue upwardly, a cutter-jet, and means whereby the operation of said jets can be controlled so the lifting-jets and the cutter-jet can be independently or simultaneously operated.

16. In dredging apparatus, the combination of a gangue-tube, a water-jet and an air-jet, for forcing the gangue upwardly, a cutter-jet, a pilot-jet, and means whereby the operation of the pilot-jet, lifting-jets and cutter-jet, can be separately controlled.

811,276. **ARBOR.** JOHN COOPER, Diamond, La. Filed Nov. 27, 1903. Serial No. 183,877.

Claim.—A collapsible vine-support comprising posts each having a reduced upper end forming a shoulder and hooks projecting from their sides, strand-wires engaged with the hooks, rings disposed upon said shoulders, tie-wires connecting the rings of each pair of posts, pegs removably engaged with the ground adjacent the posts and having perforations through their upper ends, pins engaged with the perforations and projecting laterally beyond the sides of the pegs, guy-wires engaged with the rings at one end and having connection with the pegs below said pins, wires engaged with the tie-wires and similar wires engaged with the strand-wires, the guy, tie and strand wires being made up of links having ends provided with eyes for engagement with the corresponding eyes of the adjacent alining links, the eyes of the end links of the tie-wires being engaged with the aforesaid rings at the top of the posts.

811,277. **ELECTROMAGNET.** FRED B. CORRY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 15, 1904. Serial No. 216,644.



Claim.—1. In combination with a plurality of devices to be moved, an actuating-magnet, a lever controlled by said magnet, a plurality of dogs carried by said lever, and selective means for moving said dogs into engagement with said devices.

2. In combination with a plurality of devices to be moved, an actuating-magnet therefor, a lever controlled by said magnet, a plurality of selector-magnets carried by said lever, and means controlled by said magnets for connecting said lever selectively to said devices.

3. In combination with a plurality of devices to be moved, a magnet-winding, a lever arranged to be actuated thereby, a plurality of dogs carried by said lever and adapted to engage said devices, means for holding said dogs normally out of engagement with said devices, and selector-magnets adapted and arranged to move said dogs selectively into engagement with said devices.

4. In combination with a plurality of signals, notched operating-rods therefor, a single actuating-magnet for said rods, a plurality of dogs arranged to be moved by said magnet and adapted to engage the notches on said rods, means for holding said dogs normally out of engagement with said notches, and selector-magnets adapted and arranged to move said dogs selectively into engagement with said notches.

5. In combination with a plurality of devices to be raised, a single actuating-magnet therefor, selector-magnets controlling the connections between said devices and said actuating-magnet and each comprising a coarse section and a fine-wire section of a greater number of turns, means for connecting the coarse-wire section only in circuit for raising, and means for connecting the fine-wire section in circuit when the device or devices are raised.

6. In combination with a plurality of devices to be raised, a single actuating-magnet therefor, selector-magnets controlling the connections between said devices and said actuating-magnet, means for reducing the current-flow in said magnets when the device or devices are raised, and means for increasing the number of effective turns of the selector-magnets.

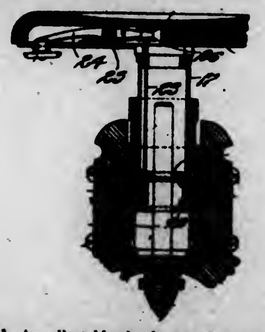
7. In combination with a plurality of devices to be raised, a single actuating-magnet therefor, selector-magnets controlling the connections between said devices and said actuating-magnet, means for connecting said magnets selectively in series with the actuating-magnet for raising a device or devices, and means for decreasing the current-flow in the magnet-circuit and increasing the effective turns

in the selector magnet or magnets when said device or devices are raised.

8. In combination with a plurality of devices to be raised, a single actuating-magnet therefor, selector-magnets controlling the connections between the several devices and the actuating-magnet, each of said selector-magnets comprising a coarse-wire section and a fine-wire section of greater number of turns, means for connecting the coarse-wire sections of said magnets selectively in series with said actuating-magnet for raising a device or devices, and means for inserting a resistance in the magnet-circuit and including said fine-wire sections in circuit when said device or devices are raised.

9. In a railway signal system, a plurality of semaphore-signals, a single actuating-magnet adapted to move said signals to safety, selector-magnets controlling the connections between the several signals and said actuating-magnet, relays arranged to connect said selector-magnets selectively in series with the actuating-magnet for moving a signal or signals to safety, and means for decreasing the current-flow in the magnet-circuit and increasing the effective number of turns in the selector magnet or magnets when said signal or signals are at safety.

811,278. ADJUSTABLE CLUTCH-CONTROLLED STANDARD. FREDERICK W. COY, Boston, Mass., assignor to Charles F. Brown, trustee, Reading, Mass. Filed July 25, 1904. Serial No. 217,602.



Claim.—1. An adjustable clutch-controlled standard comprising a supporting member, a tubular supported member inclosing the supporting member and movable relatively thereto, an annular swinging clutch carried by the tubular member and embracing and normally engaging the supporting member, and means for moving said clutch out of engagement with the supporting member.

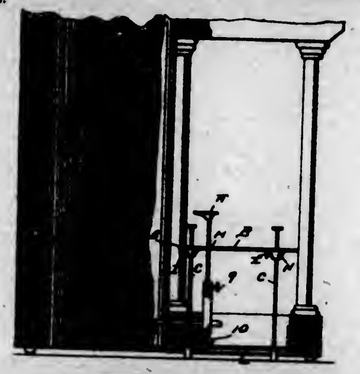
2. An adjustable clutch-controlled standard comprising a cylindrical supporting member, a tubular supported member inclosing the supporting member and movable relatively thereto, an annular clutch carried by the tubular member, said clutch embracing the supporting member, a spring which normally holds the clutch in engagement with the supporting member, and means engaged with the clutch for forcing the latter out of engagement with the supporting member.

3. An adjustable clutch-controlled standard comprising a cylindrical supporting member, a tubular supported member movable relatively to the supporting member, an annular clutch seated on a shoulder affixed to the tubular member and carried by the latter, said clutch embracing the supporting member, a spring which normally holds the clutch in engagement with the supporting member, and means including a push-rod carried by the supported member and engaged with the clutch for forcing the latter out of engagement with the supporting member.

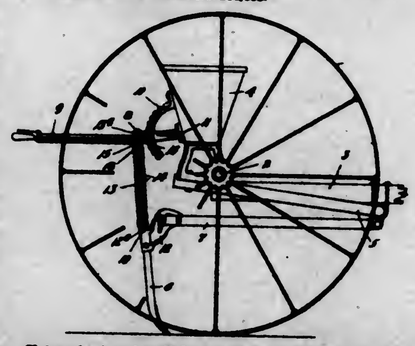
4. A piano-stool comprising a cylindrical supporting member having a suitable base, and a vertical guide, a tubular supported member having a seat affixed to its upper end, said member being movable in said guide, an annular clutch seated on a shoulder in the tubular member and embracing the supporting member, a spring which normally holds the clutch in engagement with the supporting member, a clutch-displacing rod movable in the tubular member and engaging the clutch, and an operating-lever pivotally connected with the seat and engaged with the rod.

811,279. PIANO ATTACHMENT. WALTER S. GREENLEAF and CLARENCE H. RAMSDELL, Elmira, N. Y. Filed Mar. 31, 1905. Serial No. 253,259.

Claim.—An attachment for pianos comprising a base-plate, pairs of upwardly-extending rods carried by the ends of the base-plate, a top plate having openings therein in which the rods are slidably engaged, brackets carried by the top plate and in which the rods are slidably engaged, set-screws engaged in the brackets and arranged for operation to impinge against the rods to hold the top plate at different points of its movement upon the rods, vertical rods slidably engaged in the top plate adjacent to one edge thereof, blocks having recesses in their upper ends in which the lower ends of the last-named rods are slidably engaged, set-screws engaged in the blocks and arranged for operation to impinge against the last-named rods to hold the blocks at different points of their movement with respect to said rods, said blocks having horizontal pedal-receiving passages formed therethrough and set-screws engaged in the blocks and arranged for operation to impinge against pedals engaged in the passages.



811,280. YIELDING LINK FOR SHEDDERS AND OTHER MACHINES. SPENCER B. DAVIS, Minneapolis, Minn., assignor to The Hoosier Drill Co., St. Louis Park, Minn., a Corporation of Minnesota. Filed Apr. 10, 1903. Serial No. 151,602.



Claim.—1. A spring-link, comprising a single rod bent upon itself, to form an elongated loop, and having its ends bent at one extremity of the loop to form overlapping hooks, and a coiled spring surrounding said looped rod, and closely engaging the sides thereof, substantially as described.

2. A spring-link, comprising a single rod bent upon itself to form an elongated loop, and having its ends bent at one extremity of the loop to form overlapping hooks, a filling-block interposed between the sides of said looped rod, and a coiled spring surrounding said looped rod, and resting at one end against said filling-block, substantially as described.

3. The combination with a rod bent upon itself to form an elongated loop having parallel sides, the ends of said rod being bent at one extremity of the loop to form overlapping hooks, a filling-block working between the sides of said loop, near the hooked ends thereof, and a coiled spring surrounding said looped rod, and flattened to closely engage the sides thereof, substantially as described.

4. The combination with a rod 13 bent upon itself to form a loop with parallel sides, the ends of said rod being bent to form the overlapping hooks 13', and the coiled spring 14 surrounding said looped rod, resting against said block 15, at one end, and flattened to closely engage the sides of said looped rod, substantially as described.

5. The combination with a rod 13 bent upon itself to form a loop with parallel sides, the ends of said rod being bent to form overlapping hooks 13', the filling-block 15 fitting between the sides of said looped rod, and having lips 16 engaging the sides of said rod, and the coiled spring 14 surrounding said looped rod, resting against said block 15, at one end, and flattened to closely engage the sides of said looped rod, substantially as described.

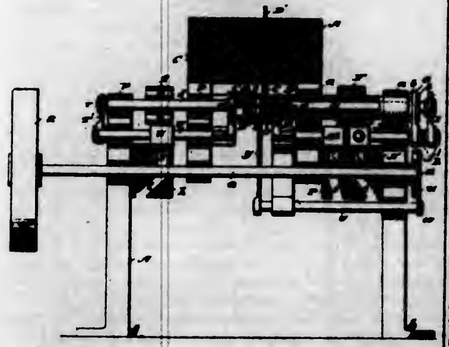
6. The combination with the rod 13 bent upon itself to form an elongated loop having parallel sides, the ends of said rod being bent to form overlapping hooks 13', the flattened coiled spring 14 surrounding said looped rod 13, the filling-block 15 fitting between the sides of said looped rod and having several perforations 17, and the pin or bolt 18 affording a base of reaction for one end of said spring and engageable with any of said perforations, to vary the tension of said spring, substantially as described.

7. In a machine of the character described, the combination with a lever-operated vertically-movable presser-bar, and a drag-bar having a tooth or ground-engaging device, of a link connecting said presser-bar to a part on the rear end of said drag-bar, said link comprising a rod bent upon itself to form an elongated loop having overlapping hooks at one end of the loop, and a coiled spring surrounding and closely engaging the sides of said looped rod, substantially as described.

8. A link formed by a rod bent upon itself to form an elongated loop and having its ends bent to form overlapping hooks, and the members surrounding the intermediate portion of said looped rod to prevent separation of the hooked ends thereof, but itself removable from said rods, substantially as described.

9. In a machine of the character described, the combination with a lever-operative presser-bar and a drag-bar having a tooth or ground-engaging device, of a link formed by a rod bent upon itself to form an elongated loop embracing said presser-bar at its upper end and pivotally attached at its lower end to a part carried by the free end of said drag-bar, substantially as described.

811,281. MACHINE FOR ROUGHING WOOD SPOOLS, CORES, &c. HENRY J. DUNCAN, Alpena, Mich. Filed Jan. 31, 1905. Serial No. 243,457.



Claim.—1. In a machine for roughing wood blocks into circular form in cross-section and providing the same with longitudinal bores, the combination of a main frame, a drive-shaft journaled therein, a rectilinearly-movable and rotatable tubular shaft having a tubular saw at its inner end and equipped with means whereby it may be rotated, means intermediate the drive-shaft and said tubular shaft for reciprocating the latter, a rectilinearly-movable and non-rotatable shaft disposed in the tubular shaft and having a hollow inner end for holding a block against rotation, means intermediate the drive-shaft and the non-rotatable shaft for reciprocating the latter by the former, a rotatable and rectilinearly-movable bit opposed to and arranged to enter the hollow inner end of the non-rotatable shaft and equipped with means whereby it may be rotated, guides disposed at right angles to the tubular shaft and the bit; one of said guides being adapted to receive the tubular shaft, and the other guide being adapted to receive the bit, means intermediate the drive-shaft and the bit for reciprocating the latter by the former, a follower movable to and fro between the guides and at right angles to the tubular shaft and the bit, and means intermediate the drive-shaft and the follower for reciprocating the latter by the former.

2. In a machine for roughing wood blocks into circular form in cross-section and providing the same with longitudinal bores, the combination of a main frame, a drive-shaft journaled therein and bearing three cams, a rectilinearly-movable and rotatable tubular shaft having a tubular saw at its inner end and equipped with means whereby it may be rotated, a rectilinearly-movable and non-rotatable shaft disposed in the tubular shaft and having a hollow inner end for holding a block against rotation, reciprocatory bars guided in the frame and having arms at their outer ends connected to the tubular shaft and the non-rotatable shaft, respectively, a block fixed on one bar in position to engage one cam on the drive-shaft and movable loosely on the other bar, a block fixed on such other bar in position to engage a second cam on the drive-shaft and movable loosely on the first-mentioned bar, a rotatable and rectilinearly-movable bit opposed to and arranged to enter the hollow inner end of the non-rotatable shaft and equipped with means whereby it may be rotated, an endwise-movable bar arranged in the main frame and having an arm connected to the bit, a block on said bar engaging a third cam on the drive-shaft, guides disposed at right angles to the tubular shaft and the bit, a follower movable between said guides, and a connection intermediate the drive-shaft and the follower for actuating the latter.

811,282. FLOOR-SCRAPER. BERT HUGGINS, Odebolt, Iowa, assignor of one-half to Cesar E. Huggins, Odebolt, Iowa. Filed Dec. 20, 1904. Serial No. 237,663.

Claim.—1. In a floor-scraper, a vertical handle, a socket-provided plate connected to the same, lateral wings extending from the plate, an adjustable plate connected to the wings, said plate having an eye at its upper portion, a scraper between the plates, and a thumb-screw working through the eye of the adjustable plate and contacting with the socket of the device for the purpose of clamping the scraper.

2. In a floor-scraper, a vertical handle, a plate connected to the same, wings extending from the plate, an adjustable plate connected to the wings, a scraper between the plates, a horizontal plate to receive the rear of the scraper, a series of slots in the adjustable plate, and screws working in the slots, by means of which the horizontal plate may be adjusted.

3. In a floor-scraper, a vertical handle, a plate connected to the same, lateral wings extending from the plate, an adjustable plate connected to the wings, a scraper carried by the plates, a lateral handle adjustably connected to the outer portions of the wings, and a brace hinged to the vertical handle and having locking means for connecting it to the lateral handle, by means of which the two handles may be locked at various angles, or the handles may be released and folded against each other.

4. In a floor-scraper, a plate having lateral wings extending from the same, an adjustable plate carried by the wings, a scraper adapted to be held between the two plates, and an adjustable corrugated plate carried by the adjustable plate and adapted to receive the rear of the scraper.

811,283. SEAL-PRESS. LOUIS A. PEARL, Chicago, Ill., assignor to Chicago Car Seal & Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 28, 1902. Serial No. 91,162.

Claim.—1. In a seal-press, the combination of a stock, a chambered head upon the stock, a die-plunger movable in said head, a die-plunger-operating lever fulcrumed upon said head, a die-plunger-re-

tracting spring, a ratchet on the die-plunger, a dog operating normally to engage said ratchet, and a movable dog-releaser actuated, in the approach of the die-plunger to its position of final impressment, to disengage the dog from said ratchet, substantially as and for the purpose set forth.

3. In a seal-press, the combination of a stock, a chambered head upon the stock, a die-plunger movable in said head, a die-plunger-operating lever fulcrumed upon said head, a die-plunger-retracting spring, a ratchet on the die-plunger, a dog operating normally to engage said ratchet, and a movable dog-releaser actuated, in the approach of the die-plunger to its position of final impressment, to disengage the dog from said ratchet, the said lever being movable independently of the die-plunger when the same is held by engagement of the dog with the ratchet, substantially as and for the purpose set forth.

3. In a seal-press, the combination of a stock, a chambered head upon the stock, a die-plunger movable in said head, a die-plunger-operating lever fulcrumed upon said head, a die-plunger-retracting spring, a ratchet on the die-plunger, a dog operating normally to engage said ratchet, and a movable dog-releaser in the path of said spring actuated, in the approach of the die-plunger to its final position of impressment, to disengage the dog from said ratchet, and actuated by the spring in the final movement of the die-plunger toward its retracted position to release said dog, substantially as and for the purpose set forth.

4. In a seal-press, the combination of a stock, a chambered head upon the stock, a die-plunger movable in said head, a plunger-operating lever fulcrumed upon said head, a die-plunger-retracting spring, a ratchet on the die-plunger, a dog operating normally to engage said ratchet, and a movable dog-releaser in the path of said lever and actuated thereby in the approach of the die-plunger to its position of final impressment, to disengage the dog from said ratchet, substantially as and for the purpose set forth.

5. In a seal-press, the combination of a stock, a chambered head upon the stock, a die-plunger movable in said head, a die-plunger-operating lever fulcrumed upon said head, a die-plunger-retracting spring, a ratchet on the die-plunger, a dog operating normally to engage said ratchet, and a movable dog-releaser in the paths of said lever and said spring, actuated by said lever in the approach of the die-plunger to its position of final impressment, to disengage the dog from said ratchet, and actuated by said spring in the final movement of said die-plunger toward the extreme retracted position to release said dog; substantially as and for the purpose set forth.

6. A seal-press having a reciprocable die provided directly with a ratchet device for insuring complete movements of the die, in combination with a pawl engaging said ratchet device.

7. A seal-press having a reciprocable die provided with a ratchet device which moves reciprocatingly with the die, in combination with a spring-held pawl engaging said ratchet device, and a relatively fixed support for said pawl.

8. A seal-press having a reciprocable die provided with a plurality of ratchet-teeth arranged parallel with a side of the die and reciprocatingly carried with the die, said teeth permitting the pawl to slip over them in the closing operation of the press, a pawl engaging said teeth to prevent return of said die before the pressing operation is completed, and means whereby the pawl is released to permit the die to return to its normally open position, for the purpose set forth.

9. A seal-press comprising a lever equipped with a head provided at its base with a fixed die and above said die with a guide for a reciprocating die, a lever pivotally joined to the upper portion of said head and provided with a die-actuating cam, a spring tending to hold the dies normally separated, a reciprocable die moving in said guide, a series of ratchet-teeth moving reciprocatingly with the reciprocable die, a pawl located in a recess in said head adjacent to the ratchet-teeth, and a spring having a bearing in said head and serving to hold the pawl in engagement with the ratchet-teeth.

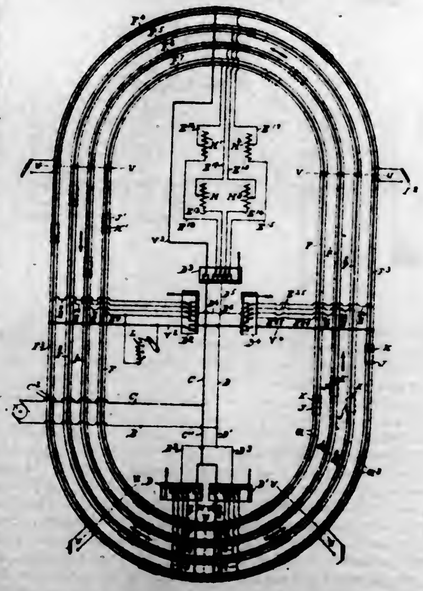
10. A seal-press comprising a lever equipped with a head provided at its base with a fixed die and provided above said die with a guide for a reciprocating die and in the rear of said guide with a pawl-receiving recess, a lever pivotally joined to the upper portion of said head and provided with a die-actuating cam, a spring tending to hold the dies normally separated, a reciprocable die moving in said guide, a series of ratchet-teeth moving reciprocatingly with the reciprocable die and located adjacent to said recess, a pawl confined in said recess and engaging said ratchet-teeth, and a spring having a bearing in said head and serving to hold the pawl in engagement with the ratchet-teeth.

11. In a ratchet seal-press, the combination with the body of the press, and with a reciprocating die movable within said body, and with a cam-carrying lever-handle and a retracting-spring for reciprocating said die, of improved means for insuring complete movements of said die, said means consisting of a ratchet device movable lengthwise with said die and a pawl having a relatively fixed support in said body of the press.

12. A seal-press comprising a lever carrying a head provided with a fixed die and with a guide for a reciprocable die, a lever pivoted to said head and provided with a die-actuating cam, a reciprocable die within said guide actuated by said cam, a spring tending to retract said reciprocable die, ratchet-teeth moving reciprocatingly with said reciprocable die, a pawl located in a recess in said head adjacent to said ratchet-teeth, and a spring having a bearing in said head and serving to hold said pawl in engagement with said ratchet-teeth.

13. A seal-press comprising a lever carrying a head provided with a fixed die and with a guide for a reciprocable die, a lever pivoted to said head and provided with a die-actuating cam, a reciprocable die within said guide actuated by said cam, a spring tending to retract said reciprocable die, and means for insuring complete movements of the reciprocable die, comprising a set of ratchet-teeth and a pawl engaging the same, one of which reciprocates with the die and the other of which is arranged at one side of said guide, said pawl being releasable when the dies are closed, for the purpose set forth.

811,284. **ELECTRIC RACE-TRACK.** THOMAS F. GAYNOR, New York, N. Y., assignor to Electric Amusement Company, a Corporation of New York. Filed Mar. 14, 1905. Serial No. 250,042.



Claim.—1. In an electric race-track, the combination of a generator a feed-conductor, a contact-conductor, a return-conductor, a railway-track, a railway-trunk carrying a propelling-motor in circuit with the generator, a ridable figure mounted thereon—and a crank

mechanism through which power is directly transmittible from the motor to the figure and vice versa, substantially as described.

2. In an electric race-track, the combination of the railway-track, a railway-track carrying a propelling-motor—a ridable moving figure mounted thereon—and a power-transmitting mechanism connecting the motor with the figure and through which movement is directly transmittible from the motor to the figure and vice versa, substantially as described.

3. The ridable race-track device consisting of, a truck with its track-wheels, a propelling-motor, a ridable figure, a standard mounted upon the truck and supporting the figure, and a power-transmitting crank mechanism connecting the motor with the figure and all being combined substantially as described.

4. In a ridable race-track device, the combination of a ridable figure, a connecting-rod supporting the figure, a crank mechanism connected to the connecting-rod and to a power-transmitting mechanism, a connecting-rod-guiding standard, and a track supporting the standard and carrying all of the elements of the combination, substantially as described.

5. In a ridable race-track device, the combination of a ridable figure, a crank power mechanism, a guiding-standard, and a connecting-rod supporting the figure at one end and connected at its other end to a crank power mechanism and having a wrist-pin connection with the standard through which a vertical and rocking motion may be given to the figure by the crank mechanism, substantially as described.

6. In a ridable race-track device, the combination of a ridable figure, a supporting-standard having a bracket to which the figure is trunnioned, a pitman connecting-rod connected at one end to the figure and by its other end to a crank-power-transmitting mechanism, a truck-propelling motor connected with the crank mechanism and a truck carrying all of the said elements, substantially as described.

7. In a ridable race-track device, the combination of a wheeled truck, a propelling-motor, a crank mechanism connected to the motor, a connecting-rod connected to the crank mechanism, a moving ridable figure connected to the connecting-rod, a standard mounted upon the truck and supporting the figure through a trunnioned connection therewith and having a pedal extension upon which a rider while upon the figure may support his weight and accelerate the speed of the truck, as desired, substantially as described.

8. In an electric race-course, the combination of a generator, a feed-conductor, a return-conductor, a series of railway-tracks, a corresponding series of trucks thereon, each carrying a ridable figure and provided with a propelling-motor, a corresponding series of contact-conductors each of which is divided into insulated sections and a circuit-controller for each contact-conductor section and connecting it with the feed-conductor and located at an operating-point within visible distance of the course, substantially as described.

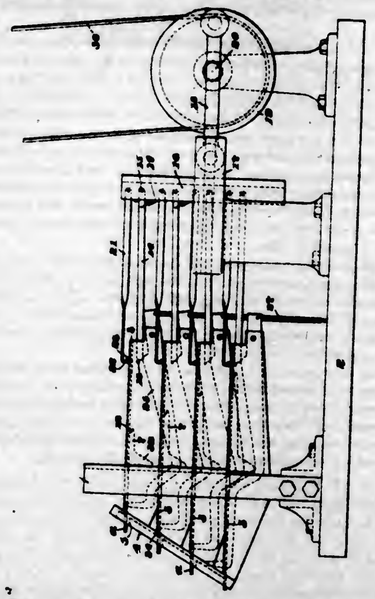
9. In an electric race-course, the combination of a generator, a feed-conductor, a return-conductor, a series of railway-tracks, a contact-conductor for each track and a combined individual and master circuit-controller connecting each and all of the contact-conductors with the feed-conductor and located within visible operating distance from the course and a truck for each track and carrying a propelling-motor, substantially as described.

10. In an electric race-course, the combination of a generator, a feed-conductor, a return-conductor, a series of railway-tracks, a truck upon each track and carrying a ridable device and a propelling-motor, a contact-conductor for each track and a combined individual and master circuit-controller connecting each and all of the contact conductors with the feed-conductor and located within visible operating distance from the course and by means of which the movements of the several trucks can be controlled while around upon the course, substantially as described.

11. In an electric race-track, the combination of a generator, a feed-conductor, a return-conductor, a truck carrying a ridable figure and provided with a propelling-motor, a controller having a rheostat mechanism, a double switch one member of which is adapted to open and close the return-conductor between the generator and the motor and the other member adapted to open and close the feed-conductor through the controller and alternately establish a circuit through the motor and the rheostat of the controller whenever the generator is thereby disconnected from the motor and the controller, substantially as described.

12. In an electric race-course, the combination of a generator, a feed-conductor, a return-conductor, a series of parallel railway-tracks, a contact-conductor for each track divided into insulated sections and the contiguous sections of the contact-conductors of two or more of the tracks being each provided with a corresponding variable-resistance device and a controller mechanism which are located at a fixed position with reference to the tracks, a truck carrying a ridable figure and provided with a propelling-motor in circuit with the generator for each truck, and the resistance devices adapted to regulate the amount of electricity supplied to their respective contact-conductors so that the trucks will be made to run around upon all of the tracks in the same amount of time and to thereby compensate for their differences of length, substantially as described.

811,285. **TYPE-SETTER'S MACHINE.** JOHN G. GOSSLER, Hyde-park, Mass. Filed Aug. 4, 1904. Serial No. 219,461.



Claim.—1. In a type-setter's machine, the combination with type-supplying means and means for maintaining type at points in the same relative positions as the divisions of a printer's case, of means for moving type from said supplying means to said points.

2. In a type-setter's machine, the combination with type-supplying means and a face-plate, having indicated thereon the divisions of a printer's case, of means for presenting the appropriate type within said divisions.

3. In a type-setter's machine, the combination with type-supply-ing means of a face-plate provided with ledges dividing said plate according to the divisions of a printer's case, and means to deposit the appropriate type within said divisions and upon said ledges.

4. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points arranged at different levels in an inclined plane, of guides connecting said magazines and points, and means controlled by the presence of type in said guides for moving type from said magazines to said points.

5. In a type-setter's machine, the combination with a plurality of type-magazines, and means for maintaining the type at a plurality of presentation-points arranged at different levels in an inclined plane, of guides connecting said magazines and points and means controlled by the presence of type at said presentation-points for moving the type from said magazines to said points.

6. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points arranged at different levels in an inclined plane, of guides connecting said magazines and points and means controlled by the type for moving type from said magazines to said points.

7. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points arranged at different levels in an inclined plane, of guides extending from said magazines, type-actuators co-

operating with said guides, and means controlled by the type for operating said actuators.

8. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides extending from said magazines and connecting said magazines and points, type-actuators in said guides and means determined by the type-demand to cause the actuators to run idly.

9. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides extending from said magazines and connecting said magazines and points, type-actuators in said guides and means to throw said type-actuators into and out of operative position.

10. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides connecting said magazines and points and means for moving the type from said magazines to said points and means to prevent the return of the type along said guides.

11. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides connecting said magazines and points and means controlled by the presence of type in said guides for moving type from said magazines to said points, said type-controlled means being provided with means to prevent the return of the type along said guides.

12. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides extending from said magazine and connecting said magazines and points, type-actuators in said guides and spring-controlled means for moving said type-actuators into operating position.

13. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides extending from said magazines and connecting said magazines and points, type-pushers in said guides, means for actuating said pushers and means for automatically throwing said actuating means into and out of operative position.

14. In a type-setter's machine, the combination with a plurality of type-magazines and means for maintaining the type at a plurality of presentation-points, of guides extending from said magazines and connecting said magazines and points, type-pushers in said guides, means for actuating said pushers and means for automatically throwing said actuating means into and out of operative position, said automatic means being spring-operated into active position and operated by said pushers into inoperative position.

15. In a type-setter's machine, a source of type-supply, means to remove type therefrom, and type-controlled means to deflect said means from the path of the type.

16. In a type-setter's machine the combination with a plurality of approximately vertically-arranged type-magazines, of means for maintaining the type at a plurality of presentation-points at different levels in a plane inclined to said magazines, guides extending from said magazines and connecting said magazines and points and type-pushers in said guides to move the type from said magazine to said points.

17. In a type-setter's machine the combination with a plurality of approximately vertically-arranged type-magazines of means for maintaining the type at a plurality of presentation-points at different levels in a plane inclined to said magazines, guides extending from said magazines and connecting said magazines and points, and type-pushers in said guides, each pusher having a range of movement equal to the distance between said magazines and said presentation-points.

18. In a type-setter's machine the combination with a plurality of type-magazines, of means for maintaining the type at a plurality of presentation-points at different distances from said magazines, guides extending from said magazines and connecting said magazines and points, type-pushers in said guides, each pusher having a range of movement equal to the distance between said magazines and said presentation-points.

811,286. LOOSE-LEAF-LEDGER BINDER. JOHN CRAMM, Milwaukee, Wis. Filed Nov. 10, 1904. Serial No. 232,915.

Claim.—1. In a loose-leaf-ledger binder, having telescoping castings and posts, equalizers to govern the lateral movement of the former, a rod pivotally connected to said equalizers, and having ratchet-teeth, a threaded shaft, a sliding member for engagement with the latter and carrying a dog which engages with said ratchet-teeth, and means for tripping said dog.

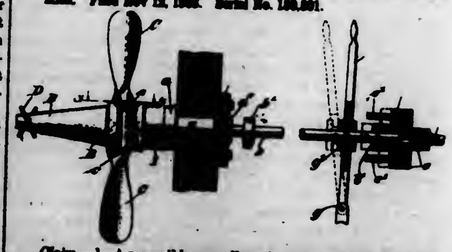
2. In combination a loose-leaf-ledger binder having telescoping castings and posts, equalizers that govern the lateral movement of the former, a shaft, a rod, and having ratchet-teeth and means for actuating said equalizers through said rod, a sliding member coacting with said shaft and carrying a dog which engages with said ratchet-teeth and means for tripping the latter.

3. In a loose-leaf-ledger binder the combination with casings movable toward and from each other, of equalizers attached to the latter and a ratchet engagement between the casings coacting with said equalizers, the said ratchet engagement including a threaded shaft member, the said threaded shaft member adapted to give lateral movement to the casings.

4. In a loose-leaf-ledger binder, casings actuated laterally, equalizers, a bar pivotally attached to the latter, an arm for engagement with said bar, a ratchet engagement between said casings coacting with said arm, the said ratchet engagement including a threaded shaft, the latter adapted to actuate said casings.

5. In a loose-leaf ledger, the combination of casings movable toward and from each other, equalizers engaging said casings, an arm actuating said equalizers, a rod, and having ratchet-teeth, a movable member and carrying a dog which engages with said ratchet-teeth, a threaded shaft coacting with said movable member and means for releasing said dog from engagement with said rod whereby said casings may be moved independently of said threaded shaft.

811,287. REVERSIBLE PROPELLER. FRANK GRAY, Muskegon, Mich. Filed Nov 12, 1903. Serial No. 180,891.



Claim.—1. A reversible propeller-wheel comprising adjustably-mounted blades, the blades being mounted on an axially-adjustable and rotary head, and a longitudinally-adjustable propeller-shaft supported for rotation and connected for reversing said blades together with a stationary member having an annular groove engaged by portions rigid with the said blades.

2. A reversible propeller-wheel comprising a stationary bearing, a propeller-shaft supported for rotation and endwise adjustment in said bearing, a head secured to said shaft, and propeller-blades adjustably mounted on said head and provided with portions engaging said bearing, together with a stationary member having an annular circumferential groove engaged by portions rigid with the said blades whereby the endwise adjustment of said shaft is accompanied by an adjustment of said blades.

3. A reversible propeller-wheel comprising a stationary bearing, a propeller-shaft supported for rotation and endwise adjustment in said bearing, a head mounted on said shaft, propeller-blades pivotally mounted on said head and provided with projections, said projections being adapted to play in arc-shaped openings in the head and to engage an annular groove in said bearing, and means for manually adjusting said shaft in an endwise direction and thereby adjusting said blades.

4. A reversible propeller-wheel comprising adjustably-mounted propeller-blades, a stationary bearing, and a rotary and longitudinally-adjustable propeller-wheel shaft supported in said bearings and connected for adjusting said blades, there being a pair of shoulders on said shaft, one shoulder being adapted to bear against the bearing when the propeller-wheel is running normally, and the other shoulder being adapted to engage the inner end of the said bearing when the propeller is reversed said bearing having a circumferential groove engaged by portions rigid with the said blades.

5. The combination of a relatively large reversible propeller-wheel, and a relatively small and non-reversible propeller-wheel, the two wheels being mounted one in front of the other.

6. The combination of a relatively large reversible propeller-wheel, and a relatively small non-reversible propeller-wheel, and power-transmitting connections for connecting both wheels with the same source of power.

7. The combination of a plurality of axially-alined propeller-wheels whereof one is provided with propeller-blades reversible independently of and without reversing the blades of another wheel.

8. The combination of a plurality of axially-alined propeller-wheels, whereof one is provided with adjustable propeller-blades, and another is provided with non-adjustable blades having a greater pitch than the adjustable blades.

9. The combination of a plurality of axially-alined propeller-wheels whereof one is provided with reversible propeller-blades and another is provided with non-adjustable propeller-blades.

10. The improved reversible propeller with reversible and non-reversible blades, substantially as shown and described.

11. The combination of a relatively large propeller-wheel and a relatively small propeller-wheel, the two being axially alined and mounted to rotate in unison in the same direction, the blades of the smaller wheel having a greater pitch than those of the larger wheel, and the blades of the larger wheel being reversible.

12. Means for driving a boat, comprising relatively large reversible propeller-blades, and relatively small non-reversible propeller-blades, substantially as and for the purposes set forth.

811,288. TAR-LINED LEADER AND PIPE. FRANK GRIESHEALER, Guttenberg, N. J. Filed Mar. 29, 1905. Serial No. 252,045.

Claim.—The process herein described of making tar-lined leaders and pipes, which consists in closing the pipe at one end, applying a layer of paper around the outer surface of the open end, charging a quantity of hot liquid tar into the interior of the pipe, at the covered end, rotating the pipe on its axis so as to distribute the tar uniformly over its inner surface, pouring out the excess of tar at the open end, and then permitting the leader or pipe to dry.

811,289. SEAT-CUSHION. HENRY S. HALE, Philadelphia, Pa., assignor to The Hale and Kilburn Manufacturing Company, a Corporation of Pennsylvania. Filed May 27, 1904. Serial No. 210,624.

Claim.—1. In a seat-cushion, the combination of a sheet-metal box-frame having a lower flange beaded at its inner edge and having its under part provided with an upwardly-extending groove parallel to the beaded edge forming a recess on the under part and an upwardly-extending rib upon the upper part of said flange, transverse supports for the springs extending over the beaded edge and resting upon the upwardly-extending rib of the box-frame, springs contained by said supports, upholstery extending over the springs and box-frame and having its edge extending over the groove on the under side of the box-frame, a clamping-strip for clamping the upholstery into the groove, and clamping-bolts for drawing the strip into the grooves upon the upholstery.

2. In a seat-cushion, the combination of a box-frame having a lower flange formed with an upwardly-extending groove, spring devices supported by the box-frame, upholstery extending over the spring devices and box-frame and having its edges extending over the under surface of the lower flange of the box-frame, clamping-strips for clamping the upholstery into the grooves, clamping-bolts for drawing said strips into the grooves upon the upholstery, and sustaining cross-slats for the spring structure having their ends extended over the lower flanges of the box-frame and held in place by the clamping-bolts.

3. In a seat-cushion, the combination of a sheet-metal box-frame having upper and lower flanges the lower of which is formed with upwardly-extending grooves on the bottom and upwardly-extending ribs on the top above the grooves, spring devices supported by the box-frame and resting upon the rib portions of the lower flange above the grooves, upholstery extending over the spring devices and box-frame and having its edges extending over the under surface of the lower flange of the box-frame, clamping-strips formed of channel-bars with the grooved portion extending downward away from the upholstery for clamping the upholstery in the grooves, and clamping-bolts for clamping the channel-bars upon the upholstery extending through the lower flange of the box-frame and having their heads shielded by the grooves of the channel-bars.

4. In a seat-cushion, the combination of a box-frame having a lower flange formed with an upwardly-extending groove on the bottom an upwardly-extending rib above the groove on the top and a beaded edge, spring devices supported by the box-frame upon the beaded edge and rib and secured to the lower flange, upholstery extending over the spring devices and box-frame and having its edges extending over the under surface of the lower flange of the box-frame, clamping-strips formed of channel-bars with the grooved portion extending downward away from the upholstery for clamping the upholstery into the grooves, and clamping-bolts for drawing said strips into the grooves of the flange of the box-frame and upon the upholstery said bolts having their heads shielded in the grooves of the channel-shaped clamping-strips.

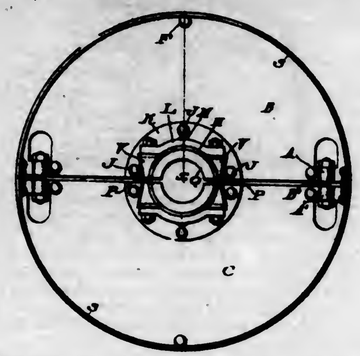
5. In a seat-cushion, the sheet-metal box-frame having upper flanges B and lower flanges C the latter being provided with grooves J and beaded edges C', in combination with clamping-strips H of considerably less cross-section than the cross-section of the grooves, clamping-bolts extending through the clamping-strips and the lower flanges at positions corresponding to the grooves, cross-slats F resting upon the beaded edges of the lower flanges and clamped in position, springs supported upon the cross-slats, spring-plates sustained by the springs and secured at their ends to the box-frame, and upholstery extending over the springs and box-frame and having its edges clamped between the grooved portions of the lower flanges of the box-frame and the clamping-plates.

811,290. PULLEY. HOWARD T. HALLOWELL, Davisgrove, Pa., assignor to Standard Pressed Steel Company, a Corporation of Pennsylvania. Filed Oct. 12, 1903. Serial No. 176,979.

Claim.—1. A pulley comprising two sections, each section consisting of a rim, a web integral with said rim, a hub having portions embracing and secured to said web, and means independent of the web and coacting with said hub for securing the sections of the pulley together.

2. A pulley formed in sections, web-sections and rim formed integral, a hub having portions embracing and secured to the web-sections, yokes adapted to pass around the hub-sections, and means independent of the web securing the yokes together outside said hub-sections, whereby the sections of the pulley are secured together with respect to each other.

3. A pulley comprising two sections, each section consisting of a rim, a web integral with said rim, a hub secured to said web and having portions embracing the same, yokes passing around said hub-sections and bolts traversing the joint between the sections and independent of the hub at each side of the yokes for locking the same together.



4. A pulley formed of two sections, each consisting of a rim, a web formed integral with said rim, and hub-sections embracing and secured to said web, means for locking said sections together at the hub and means independent of the web for keeping said sections in alinement at a point adjacent said rim.

5. A pulley formed of two sections, each consisting of a rim, a web formed integral with said rim, and hub-sections embracing and secured to said web, of means for uniting said sections together adjacent the rim, means between said uniting means and the rim for keeping the sections in alinement and means for locking the sections together, said last-mentioned means being independent of the web and secured to the hub-sections.

6. A pulley formed of two sections, each consisting of a rim, a web formed integral therewith, a hub having portions embracing and attached to said web, and lugs integral with said hub and through the medium of which the sections are secured together and interlocking means at the rim at the joint between said sections.

7. A pulley formed of sections, each section consisting of a rim, web portions formed integral therewith, a hub having portions embracing and secured to said web, and interlocking clips mounted on said rim for keeping the sections in alinement.

8. A pulley formed of sections, each section consisting of a rim, web-sections formed integral therewith, a washer situated between said web-sections, a hub having lugs secured to the web, a bushing having an extension fitted between the web-sections and means for securing said hub-lugs, web-sections and washer together.

9. A pulley formed in sections each section comprising a rim, a web-section integral therewith, a hub having a flange bearing against the web-section, lugs on the web-section and securing means for the sections of the pulley passing through said lugs.

10. A pulley formed in sections each section comprising a rim having rounded edges, a web-section integral therewith, a hub having a flange parallel with the web-section adjacent the hub, means embracing said hub and independent of the web-section and means for securing the parts together adjacent the hub.

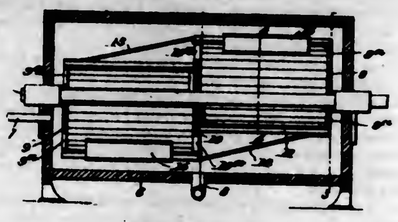
11. A pulley comprising two sections, each section consisting of a rim, a web integral with said rim, a hub having flanges embracing and secured to said web and forming a stiffening and strengthening means therefor and bolt-lugs independent of the web and carried by said hub for clamping the sections of the pulley together.

811,291. WASHING-MACHINE. FRANK H. HALSTEAD, Wheaton, Ill. Filed Sept. 27, 1904. Serial No. 225,170.

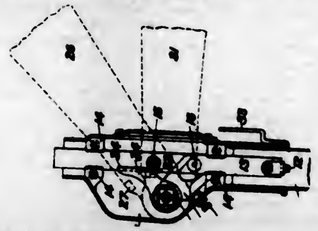
Claim.—1. The combination with an outer tub, of a clothes-receptacle rotatable within the same, comprising a plurality of cylinders having openings, and arranged end to end and eccentrically with respect to the axis of rotation.

2. The combination with an outer tub, and a shaft extending across the same, of a rotatable clothes-receptacle within the tub, comprising a plurality of eccentric cylinders arranged end to end along the shaft, with one head forming an end for two cylinders.

3. The combination with an outer tub, and a shaft extending across within the same, of a series of eccentric cylinders arranged end to end along the shaft, and disposed oppositely with respect to their eccentricity, to balance each other.



811,292. SEMAPHORE. CHARLES HARRIS, Rochester, N. Y. Filed July 20, 1904. Serial No. 217,269.



Claim.—1. A railway-semaphore consisting of a pair of movable semaphore-blades, and a single actuating means for setting and retaining said blades in a registering position and in a separated non-registering position.

2. A railway-semaphore consisting of a pair of movable semaphore-blades, and a single actuating means for setting and retaining said blades in one position in which both are visible, separated from each other, from one point of view, and in one or more other positions in which only one blade is visible from the same point of view.

3. A railway-semaphore consisting of a pair of semaphore-blades, means for setting one blade to a certain position, and means for setting the second blade, and with it the first blade, to another position.

4. A railway-semaphore, consisting of a pair of semaphore-blades normally supported in the danger position, means for setting one blade to the caution position, and means for setting the second blade, and with it the first blade, to the safety position.

5. A railway-semaphore, consisting of two semaphore-blades one on a shaft and the other on a sleeve surrounding the shaft, means for operating one blade by itself, and means for operating the first blade by the second blade.

6. A railway-semaphore, consisting of a pair of semaphore-blades, pivoted on the same axis, a striker on each blade, and an actuating-bar adapted to engage first one striker and then the other striker.

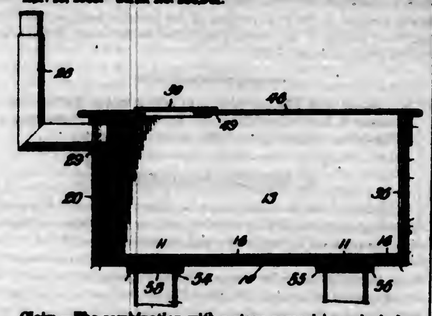
7. A railway-semaphore, consisting of a pair of semaphore-blades pivoted on the same axis, a striker on each blade, an actuating-bar adapted to engage first one striker and then the other striker, and means for moving one blade by the other from an intermediate to a final position.

8. A railway-semaphore consisting of a pair of movable semaphore-blades, and a single actuating means for setting and retaining said blades in two registering positions and in an intermediate, separated non-registering position.

811,293. TOOL FOR REMOVING SICKLE-BARS. SAMUEL M. HILL, Sunnyside, Wash. Filed Jan. 11, 1905. Serial No. 240,804.

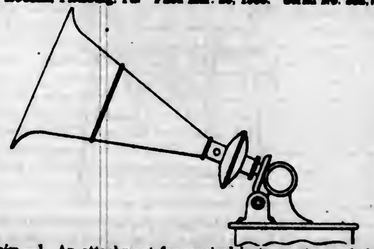
Claim.—A tool for removing pitman-rods, consisting of a head recessed in its under side to fit over the pitman-head and formed with claws adapted to straddle the pitman-rod back of the head, a shank integral with said head, and a chain connected with the end of said shank.

811,294. FOLDING STOVE. PETER HELLER, Foley, Minn. Filed Apr. 10, 1905. Serial No. 255,241.



Claim.—The combination with a stove comprising a body having a smoke-opening in its side and a top having a depending flange at its side and end edges provided at one portion with a notch registering with the smoke-opening of the body, of a smoke-pipe fitted in the smoke-opening and notch and provided with a flange disposed between the body and the flange of the top.

811,295. ATTACHMENT FOR MUSICAL INSTRUMENTS. JOHN O. HOUSER, Pittsburg, Pa. Filed Mar. 20, 1905. Serial No. 250,719.



Claim.—1. An attachment for musical instruments consisting of two members, an outwardly-extending pipe carried by each member, the ends of said pipes being slotted, a regulator mounted in one of said pipes, a diaphragm interposed between said members, and means to secure said members together, substantially as described.

2. An attachment for musical instruments consisting of two members substantially in the form of segments of spheres, a diaphragm interposed between said members, a regulator carried by one of said members, and means to secure said members together, substantially as described.

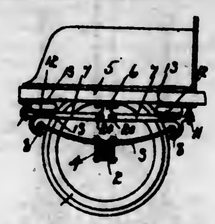
3. The combination with a musical instrument, adapted to produce sounds, of an attachment consisting of two members substantially in the form of segments of spheres, a diaphragm mounted between said members, means to secure said members together, and means to regulate the sounds passing through said attachment, substantially as described.

4. In an attachment for musical instruments, the combination with an instrument capable of producing a sound, of two members, a diaphragm mounted between said members, means to secure said members together, means to regulate the sounds passing through said members, and means to secure said members to said musical instrument, substantially as described.

811,296. PNEUMATIC SPRING FOR VEHICLES. MATTHEW M. HOWLAND, Providence, R. I., assignor of one-half to William W. Dunnell, Providence, R. I. Filed May 11, 1905. Serial No. 259,969.

Claim.—1. An improvement in vehicles comprising a vehicle-body, running-gear therefor including springs, pneumatic cushions, yieldable means engaging said cushions and connecting said body with said running-gear to prevent longitudinal motion on the parts and yieldable means to prevent lateral motion on the parts.

2. An improvement in vehicles comprising a vehicle-body, running-gear therefor, pneumatic cushions and springs interposed between said running-gear and body, and yieldable means operatively connected to said cushions to prevent longitudinal and lateral motion of said body on said cushions.



4. An improvement in vehicles comprising a vehicle-body, springs therefor, pivoted members supported by said body and interposed between said springs and said body, and pneumatic cushions interposed between said pivoted members and said body.

5. An improvement in vehicles comprising a vehicle-body, running-gear therefor, springs carried by said running-gear, pivoted members supported by said body and interposed between said springs and said body, and pneumatic cushions interposed between said pivoted members and said body.

6. An improvement in vehicles comprising a vehicle-body, running-gear therefor, pneumatic cushions and springs interposed between said running-gear and said body, and members pivoted at one end to said body and having their free ends connected to said springs, said members being operatively connected with said cushions, whereby lateral and longitudinal play of said body is prevented.

7. An improvement in vehicles comprising a vehicle-body, springs therefor, members pivoted at one end to said body and having their free ends connected to said springs, and pneumatic cushions interposed between said pivoted members and said vehicle-body.

8. An improvement in vehicles comprising a vehicle-body, springs therefor, pivoted members supported by said body and interposed between said springs and said body to prevent longitudinal play of the parts, pneumatic cushions interposed between said pivoted members and said vehicle-body, and means connected to said pivoted members to prevent lateral play on the parts.

9. An improvement in vehicles comprising a vehicle-body, springs therefor, depending brackets carried by said body, members pivotally mounted at one end in said brackets and having their free ends connected to said springs, and pneumatic cushions interposed between said vehicle-body and the free ends of said members.

10. An improvement in vehicles comprising a vehicle-body, running-gear therefor, pneumatic cushions and springs interposed between said running-gear and body, depending brackets carried by said body, members pivotally supported at one end in said brackets and having their free ends connected to said springs, said members being operatively connected with said cushions, and means connected to the free ends of said pivoted members to prevent lateral play of the parts.

11. In a vehicle, the combination with the vehicle-body, metal springs, means for supporting said springs from the running-gear of the vehicle, yielding members hinged at one end to said body and connected at their opposite ends with said springs, and pneumatic cushions interposed between said members and the vehicle-body.

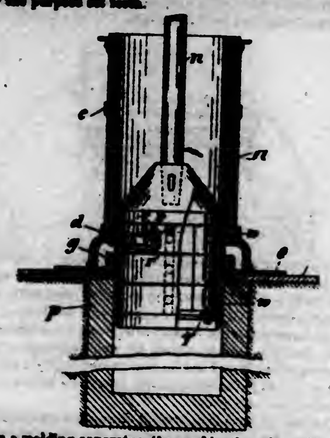
12. In a vehicle, the combination with the vehicle-body, the vehicle running-gear, metal springs, means for supporting said springs from said running-gear, yielding members hinged to said vehicle-body and connected at their opposite ends with said springs, means for supporting the yielding ends of said members against lateral strains, and pneumatic cushions interposed between said members and vehicle-body.

811,297. MOLDING APPARATUS. CARL J. KIELSEMS, Bernholm, Denmark. Filed June 21, 1905. Serial No. 266,317.

Claim.—1. In a molding apparatus, the combination of a mold, a rotating core, a spiral rib upon the core, and means to roughen the surface formed by the rib, substantially as and for the purpose set forth.

2. In a molding apparatus, the combination of a mold, a rotating core, a spiral rib upon the core, and means upon the lower end of the rib to roughen the surface of the molded substance formed by the rib, substantially as and for the purpose set forth.

3. In a molding apparatus, the combination of a mold, a rotating core, a spiral rib upon the core, and a plow in the rib to roughen the surface of the molded material placed by the rib, substantially as and for the purpose set forth.



4. In a molding apparatus, the combination of a mold, a rotating core, and means upon the core to resist wear.

5. In a molding apparatus, the combination of a mold, a rotating core, a spiral rib on the core, and means just below the rib upon the core to resist wear.

6. In a molding apparatus, the combination of a mold, a rotating core, and removable means upon the core to resist wear.

7. In a molding apparatus, the combination of a mold, a rotating core, and a removable ring in the surface of the core to resist wear.

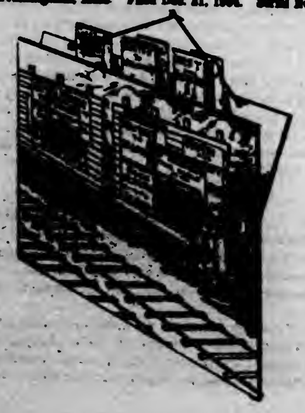
8. In a molding apparatus, the combination of a mold and a rotating core, said core having a supporting portion and a forming portion slightly greater in diameter than the supporting portion, substantially as and for the purpose set forth.

9. In a molding apparatus, the combination of a mold, and a cylindrical rotating core, said core having a forming portion near its forward end and a slightly-reduced supporting portion, substantially as and for the purpose set forth.

10. In a molding apparatus, the combination of a mold, and a cylindrical rotating core, said core having a ring in its surface of slightly greater diameter than the diameter of the core, substantially as and for the purpose set forth.

11. In a molding apparatus, the combination of a mold, a cylindrical rotating core, and a spiral rib upon the core, said core having a ring in its surface near the rib which ring has a slightly larger diameter than the diameter of the core, substantially as and for the purpose set forth.

811,298. BULLETIN-BOARD AND RACK. RICHARD W. KNOWLTON, Framingham, Mass. Filed Dec. 21, 1904. Serial No. 287,702.

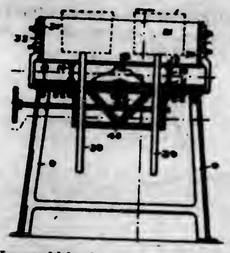


Claim.—A combined bulletin-board and rack, consisting of a bulletin member and a supporting member, the latter being so pivotally secured to the rear portion of the bulletin member that the center of gravity of the combination is below the pivot, and allows the members to form a rack.

811,299. SALVER OR TRAY. ROBERT B. KNOX, Meriden, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed May 16, 1905. Serial No. 260,566.

Claim.—A salver comprising a bottom, a border and a depending collar, a portion of the bottom cut away, a block larger in dimensions than the cut-away portion and extending beneath the under face of the bottom, said block formed with an upper face corresponding in thickness to the thickness of the bottom and in outline to the cut-away portion through which it extends, and a cup-shaped metal back located within said collar and inclosing said block, and means for securing the back to the bottom whereby said block is held in position, substantially as described.

811,300. MACHINE FOR MAKING ARTIFICIAL STONE. HARVEY S. KLINE, Indianapolis, Ind., assignor of one-half to Alva F. Van Ostram, Indianapolis, Ind. Filed Mar. 11, 1905. Serial No. 249,886.



Claim.—1. In a mold for forming concrete and other articles, a pallet forming the bottom of the mold, said pallet being large enough to receive the largest-sized articles, said pallet having perforations for the passage of core-supporting bars, said openings being long enough to permit of the adjustment of the core-bars for all sizes of the product, slides mounted in said openings and movable therein, said slides being just enough shorter than the slot to permit of the passage of a rack-bar, sides and ends of the mold placed upon said pallet, and means for adjusting their distances from each other to vary the size of the mold.

2. In a mold for forming building-blocks, a pallet large enough to form the base of the mold for blocks of maximum dimensions, sides and ends for a mold placed upon said pallets, means for supporting said sides and ends, and means hinged under the pallet for varying the distances between said sides and ends, thereby varying the dimensions of the mold.

3. In a machine for molding concrete building-blocks, brick and the like, a pallet, mold sides and mold ends, located upon said pallet, and arms hinged below said pallet having standards to which said sides and ends are fastened, said arms extending from their hinges to the top of the pallet and extending thence inwardly of the pallet approximately parallel therewith and above the pallet and terminating in standards at right angles to said pallet.

4. In a machine for forming blocks, brick and other building material out of concrete and the like, a table, a pallet removably supported above the table, mold ends and sides located upon the pallet, bars secured to the table in a manner to permit of their longitudinal adjustment, bars hinged to said longitudinally-adjustable bars, said second bars extending from the hinges to the top of the pallet and bent inwardly of the pallet and terminating in standards approximately at right angles to the pallet and means for securing sides and ends of the mold to said standard.

5. In a machine for forming building-blocks, brick and the like out of concrete and other material, a table, bolts passing through said table and extending above same and adjustable in the lengths of said extended portions, a pallet resting upon and supported by said bolt extensions and removably secured thereto, longitudinally-sliding bars secured to said table, other bars hinged to said sliding bars, said other bars extending to the top of the pallet and then inwardly

of the pallet and terminating with standards approximately at right angles to the pallet; and mold sides and mold ends supported by said standards.

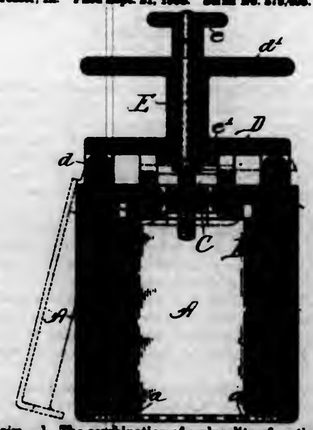
6. A mold for forming blocks, bricks and the like building material, said mold having sides and ends hinged under the mold-bottom, a bottom having openings changeable in position and a core, bars extending through the bottom, a core removably secured to said bars and means for moving the bars longitudinally so as to raise the core out of the mold after the molding operation.

7. In a molding-machine, a table having longitudinally-adjustable bolts extending therethrough, a pallet with under side sockets to receive the ends of said bolts, slideways under said table, longitudinally-adjustable bars in said slideways, means for holding a given adjustment of said bars, mold ends and mold sides located upon said pallet, arms hinged to the adjustable bars and extending to the top of the pallet and thence inwardly out of the pallet and terminating with standards, means for removably securing the mold ends and mold sides to their respective standards, vertical rack-bars extending through the table and through the pallet to support the mold-core, a shaft, and cog-wheels thereon engaging said rack-bars for the longitudinal adjustment of the latter by the rotation of said shaft.

8. In a mold for the purposes specified, a pallet having slots for the passage of core-supporting bars and slides to change the opening in said slot, said slide having no portions extending above the top face of the pallet and said slides being just enough shorter than their respective slots to permit of the passage of a rack-bar.

9. In a machine for the purposes specified, a table supported on legs, a plurality of bolts passing through said table, means for adjusting the extension of said bolts above the table, a pallet with under side sockets said pallet being located above the table with the ends of the bolts entering said sockets, said table having under side slideways, bars longitudinally adjustable in said slideway, set-screws to hold a given adjustment of said bar, mold ends and mold sides located upon and above said pallet, arms hinged to said adjustable bars, said arms extending to the top of the pallet and thence inwardly above the pallet and terminating with standards, which are fastened to the respective mold ends and mold sides, metal straps from said ends and sides passing around said standard, a frame secured to the under side of the table and adjustable transversely of the table, vertical rack-bars carried by said frame, said rack-bars passing through slots in the table and in the pallet, and forming a support for a core which is removably secured to the ends of said rack-bars, a shaft carried by said frame, said shaft having toothed wheels to engage with and operate said rack-bars.

811,301. CORE-EXTRACTING DEVICE. RUDOLPH D. KLEIN, Streator, Ill. Filed Sept. 21, 1905. Serial No. 279,033.



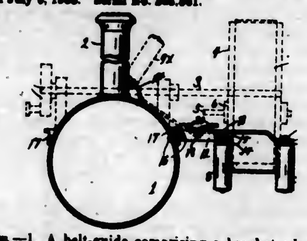
Claim.—1. The combination of a plurality of vertical jaws having interned flanges at their lower ends, a member supported on said jaws, a bolt working through said member, and arms connected with said jaws and actuated by said bolt, for the purpose set forth.

2. The combination of a plurality of vertical jaws equipped at their upper ends with rigid interned arms, a handle-equipped member supported on said jaws, and a bolt working therethrough and serving to actuate said arms, for the purpose set forth.

3. The combination of a plurality of vertical jaws equipped at their upper ends with rigid interned arms, a member pivotally supported upon the upper portions of said arms and equipped with a handle, a nut connected with the inner ends of said arms, and a bolt journaled in said handle-equipped member and working in said nut, for the purpose set forth.

4. The combination of a plurality of vertical jaws having interned toothed flanges at their lower ends, a member supported on said jaws, and a screw supported on said member and serving to actuate the jaws, for the purpose set forth.

811,302. BELT-GUIDE. KNUD H. KNUDSEN, Buxton, N. D. Filed July 6, 1905. Serial No. 268,661.



Claim.—1. A belt-guide comprising a bracket adapted to be fixed to an object near the belt, a revoluble guiding-roller on a stud secured in the fixed bracket, an arm pivoted to the bracket and having a revoluble guiding-roller normally disposed parallel to the first-mentioned roller, and locking means for holding said arm in lowered and in raised position substantially as and for the purpose set forth.

2. A belt-guide comprising a bracket securable to an object near the belt, a revoluble guiding-roller carried thereby, an arm pivoted to the bracket and having a revoluble guiding-roller normally disposed parallel to the first-mentioned roller, said rollers being adjustable to and from each other and to and from the object supporting the bracket.

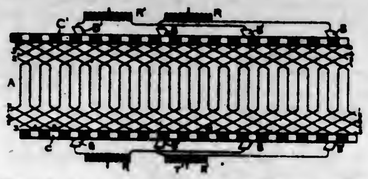
811,303. HUB. LAURENCE S. LAGERBAR, New York, N. Y. Filed Nov. 17, 1904. Serial No. 233,166.

Claim.—1. A sheet-metal hub, comprising metal members suitably cut and bent into box-like form, the sides and bottom of said box-like sections being adapted to conform to the axle, the sides of the box-like sections being bent at right angles to the axle, a piece of metal being provided for each section to fit over one-half of the axle, said pieces of metal being attached to the curved portions of the bottoms of the box-like sections and projecting beyond the sides of the sections affording provision for securing said sections together.

2. A sheet-metal hub, comprising metal members suitably cut and bent into box-like form, the sides and bottom of said box-like sections being adapted to conform to the curvature of the axle, a piece of metal being provided for each section to fit over one-half of the axle, said pieces of metal being attached to the curved portions of the bottoms of the box-like sections and projecting beyond the sides of th esections affording provision for securing said sections together.

3. A sheet-metal hub, comprising metal members suitably cut and bent into box-like form, the sides and bottom of said box-like sections being adapted to conform to the curvature of the axle, a piece of metal being provided for each section to fit over one-half of the axle, said pieces of metal being attached to the curved portions of the bottoms of the box-like sections and projecting beyond the sides of the sections affording provision for securing said sections together, and clamps for securing said sections together, comprising sheet-metal strips having curved or indented portions adapted to fit over the said pieces of metal of the sections projecting beyond the sides of the sections, and bolts for securing the parts of the clamps together.

811,304. ALTERNATING-CURRENT MACHINE. MARIUS C. A. LATOUR, Paris, France, assignor to General Electric Company, a Corporation of New York. Filed June 26, 1894. Serial No. 514,998.



Claim.—1. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, a commutator composed of alternate live and dead segments, and a plurality of brushes of each polarity distributed around said commutator, the width of a brush being not greater than that of a segment.

2. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, a commutator composed of alternate live and dead segments, a plurality of brushes of each polarity distributed around said commutator, the width of a brush being not greater than that of a segment, and resistances coanecting brushes of like polarity.

3. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, a commutator composed of alternate live and dead segments, a plurality of brushes of each polarity distributed around said commutator, the width of a brush being not greater than that of a segment, resistances connecting brushes of like polarity, and means for varying the amount of said resistance.

4. In an alternating-current motor, a multipolar field-magnet, a wave-armature winding, a commutator composed of alternate live and dead segments, a plurality of brushes of each polarity distributed around said commutator, the width of a brush being not greater than that of a segment, resistances connecting brushes of like polarity, and means for cutting out said resistances when the motor comes up to speed.

5. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, a commutator therefor having alternate live and dead segments, a plurality of brushes of each polarity distributed around said commutator, said brushes being so arranged that one brush is on a live segment when another brush of the same polarity is on a dead segment.

6. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, a commutator therefor having alternate live and dead segments, a plurality of brushes of each polarity distributed around said commutator, the width of a brush being not greater than that of a segment and said brushes being so arranged that one brush is on a live segment when another brush of the same polarity is on a dead segment, and resistances conecting brushes of the same polarity.

7. In an alternating-current machine, two commutators connected to opposite ends of the armature-conductors, each commutator having alternate live and dead segments, brushes bearing on said commutators, and resistances connecting brushes of the same polarity on opposite commutators.

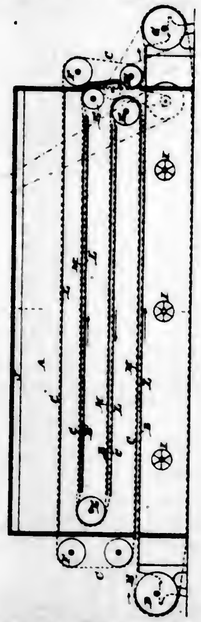
8. In an alternating-current machine, a multipolar field-magnet, a wave-armature winding, two commutators connected to opposite ends of the armature-conductors, each commutator having alternate live and dead segments, a plurality of brushes of each polarity distributed around each commutator, the width of a brush being not greater than that of a segment and the brushes being so arranged that when one brush is on a dead segment other brushes of the same polarity are on live segments, and resistances interconnecting the brushes of the same polarity.

811,305. HEAD FOR CARPENTERS' BRACES. ADOLPHE D. LEBLANC, Montreal, Canada. Filed July 31, 1903. Renewed Oct. 4, 1905. Serial No. 281,943.

Claim.—1. In combination, a brace having a vertical threaded upper extension, a collar rigidly attached thereto, a plate having an opening to receive said extension, a nut mounted upon the extremity of said extension beyond said plate, there being annular grooves between said plate, said collar, and said nut, the same constituting ball-raceways, and a cap attached to said plate.

2. In combination, a brace having an upper vertical threaded extension, a threaded collar mounted upon said threaded extension, a circular plate having a marginal upwardly-projecting flange, and having an opening of an enlarged diameter with respect to said extension, the same receiving said extension therethrough, a nut mounted upon the extremity of said extension, there being annular grooves in the faces between said nut, plate, and collar, balls carried therein, and a cap attached to said plate and having a recess therein adapted to receive said nut.

811,306. DRYING-MACHINE. JOHN H. LORIMER, Philadelphia, Pa. Filed May 20, 1905. Serial No. 261,264.



Claim.—1. In a drying-machine, a chamber, and means for circulating air-currents through said chamber, combined with two endless aprons of open-work for conveying materials between them to be treated through said chamber, guiding-wheels for said aprons at both ends of the chamber, and means arranged between the guiding-wheels for separating the two aprons whereby in their horizontal travel the upper apron shall not press heavily upon the material supported by the lower apron.

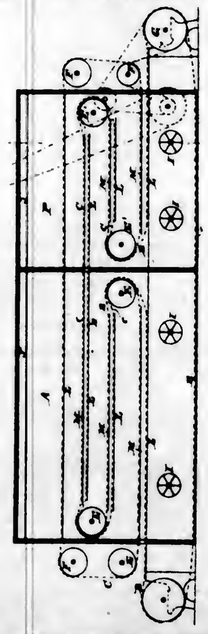
2. In a drying-machine, the combination of a chamber, means for creating a circulation of air in a vertical direction through the chamber, two endless aprons of open-work for conveying between them materials to be dried, guiding-wheels for causing the aprons to travel back and forth through the machine at different levels, and means for separating the two aprons during their travel between the guiding-wheels whereby no undue pressure is put upon the materials to be treated when they are being subjected to the action of the air-currents.

3. In a drying-machine, a chamber, and means for circulating air-currents through said chamber, combined with two endless aprons of open-work and sprocket-chains at their side edges for conveying materials between them to be treated through said chamber, guiding-wheels for said aprons at both ends of the chamber, and means consisting of lateral guides for the chains arranged between the guiding-wheels for separating the two aprons whereby in their horizontal travel the upper apron shall not press heavily upon the material supported by the lower apron.

4. In a drying-machine, a chamber through which currents of air or other gaseous medium is circulated combined with two endless aprons which separate at each end of the chamber to respectively receive and discharge the materials being treated, guiding devices at each end of the chamber for guiding the aprons, and means within the chamber intermediate of the guiding devices for separating the aprons while passing through the chamber.

5. In a drying-machine a chamber through which currents of air or other gaseous medium is circulated combined with two endless aprons which separate at each end of the chamber to respectively receive and discharge the materials being treated said aprons having a procket-chains upon their edges, guiding devices at each end of the chamber for guiding the aprons and their chains, and means within the chamber intermediate of the guiding devices consisting of laterally-extending guide-irons upon which the chains travel for separating the aprons while passing through the chamber.

811,307. DRYING AND CONDITIONING MACHINE. JOHN H LORIMER, Philadelphia, Pa. Filed May 20, 1905. Serial No. 261,265.



Claim.—1. In a machine for drying and conditioning materials, the combination of a drying-chamber and a conditioning-chamber arranged end to end, guide-wheels for guiding two endless aprons back and forth through each of said chambers, two endless aprons for holding the materials to be treated between them and guided about the guide-wheels, and means within the chambers for separating the two aprons slightly to remove pressure from the materials while passing between the guide-wheels.

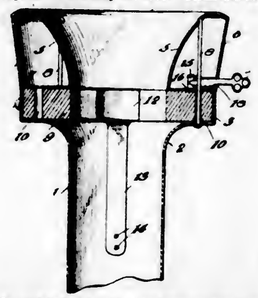
2. In a machine for drying and conditioning materials, the combination of a drying-chamber and a conditioning-chamber arranged end to end, guide-wheels for guiding two endless aprons back and forth through each of said chambers, two endless aprons for holding the materials to be treated between them and guided about the guide-wheels, and means consisting of horizontal guides L M within the chamber for separating the two aprons slightly to remove pressure from the materials while passing between the guide-wheels.

3. In a machine for drying and conditioning materials, the combination of a drying-chamber and a conditioning-chamber arranged end to end, guide-wheels for guiding two endless aprons back and forth through each of said chambers, two endless aprons of open-work with sprocket-chains on their edges for holding the materials to be treated between them and guided about the guide-wheels, and means consisting of guides within the chambers for supporting the sprocket-chains and thereby separating the two aprons slightly to remove pressure from the materials while passing between the guide-wheels.

4. In a machine for drying and conditioning materials, the combination of a drying-chamber and a conditioning-chamber arranged end to end, guide-wheels for guiding two endless aprons back and forth through each of said chambers, two endless aprons for holding the materials to be treated between them and guided about the guide-wheels, means within the chambers for separating the two aprons slightly to remove pressure from the materials while passing between the guide-wheels, and means for circulating drying and conditioning media separately through the respective drying and conditioning chambers.

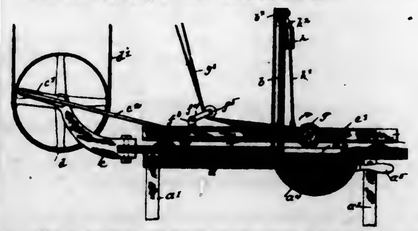
5. In a machine for drying and conditioning textile materials, the drying and conditioning chambers arranged end to end, guide-wheels for said chambers, two endless aprons guided by the guide-wheels so as to pass alternately back and forth in each chamber and through the two chambers successively, and separate means for each chamber for respectively circulating the drying and conditioning mediums.

811,308. WHIP-HOLDER. TOWIE LUDEWICK and HUMBERT LUDEWICK, Irving, Ill. Filed May 19, 1905. Serial No. 261,227.



Claim.—In a whip-holder, the combination of a socket or hollow body adapted to receive a whip, springs secured to the socket interiorly thereof, whip-engaging dogs carried by said springs, a rotatable disk mounted upon the socket or body and provided with cam-surfaces to engage the engaging dogs in actuating the same, a handle for manipulating said rotatable disk, the disk having a plurality of arcuately-arranged teeth, a socket-head secured to the socket or hollow body of the holder, a locking-pawl pivotally mounted in said socket-head and adapted to engage the teeth of the disk, and a key insertible into the socket-head to disengage the locking-pawl from the disk, substantially as set forth.

811,309. HAT-TIP-RUBBING MACHINE. WALTER H. LUM, Chicago, Ill. Filed Aug. 31, 1903. Serial No. 171,260.



Claim.—1. In a machine of the class described, a table, a reciprocating and tilting carriage arranged above the table, a brush rotatably mounted on said carriage, means for rotating the brush and means for reciprocating and tilting the carriage.

2. In a machine of the class described, a table, a reciprocating carriage adapted to be raised at one end and to fall by gravity, means for modifying the action of gravity on the carriage, and means for reciprocating the carriage.

3. In a machine of the class described, a table having an opening therein, a slideway secured to said table, a carriage adapted to reciprocate in said slideway, a cylindrical brush rotatably mounted at the forward end of said carriage, means for reciprocating the carriage and means for rotating the brush.

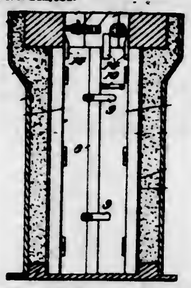
4. In a machine of the class described, a table, a slideway secured to said table, a carriage adapted to reciprocate in said slide-

way, means for raising the carriage in its forward movement, a brush mounted at the forward end of said carriage and means for reciprocating the carriage.

5. In a machine of the class described, a table, a slideway secured to said table, a carriage adapted to reciprocate in said slideway, means in said slideway for raising the carriage in its forward movement and permitting it to drop in its rearward movement, a brush mounted at the forward end of said carriage and means for operating said carriage.

6. In a machine of the class described, a table having an opening therein and a drawer arranged under said opening, a slideway secured to said table and extending along each side of said opening, a carriage slidably mounted in said slideway, means for raising and lowering the carriage relative to said slideway, means for sliding the carriage, a cylindrical brush rotatably mounted in said carriage and means for rotating said brush.

811,810. MOLD. EDWARD L. MAAG, Clarksburg, Ohio. Filed May 27, 1905. Serial No. 262,651.



Claim.—1. In a pipe-mold, the combination of a mold composed of sections, a core therefor comprising a plurality of sections pivotally connected together, adjacent sections of the core having abutting portions disconnected to permit collapsing thereof, said disconnected portions of the sections overlapping, means for holding the sections in operative positions, and a strip carried by one of the sections disconnected as above described and adapted to overlap the adjacent abutting portion of the other disconnected section to preserve the cylindrical shape of the core.

2. In a pipe-mold, the combination of a mold composed of sections, a core therefor comprising a plurality of sections pivotally connected together, adjacent sections of the core having abutting portions disconnected to permit collapsing thereof, said disconnected portions of the sections overlapping, a strip carried by one of the sections disconnected as above described and adapted to overlap the adjacent abutting portion of the other disconnected section to preserve the cylindrical shape of the core, and joint-braces interposed between opposing sections of the core.

3. In a pipe-mold, the combination of a removable core, and a jacket or shell surrounding the core and adapted to be reduced in diameter on removing the same.

811,811. BLOTTING-RULER. GEORGE W. MACKENZIE, Ben Avon, Pa. Filed Feb. 9, 1905. Serial No. 244,922.

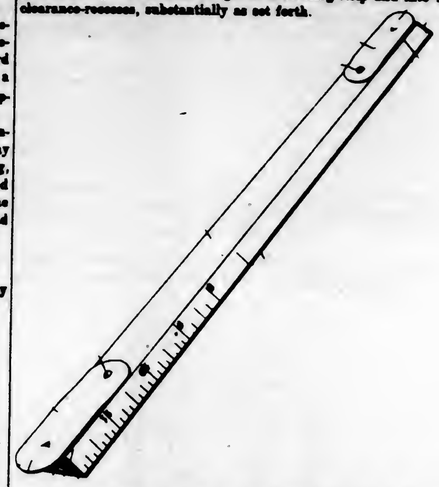
Claim.—1. A ruler provided at each end with pivotally-mounted spring-clips having inwardly-turned piercing-points, substantially as set forth.

2. A ruler provided at each end with clearance-recesses, and pivotally-mounted spring-clips having inwardly-turned piercing-points adapted to enter said recesses, substantially as set forth.

3. A ruler provided at each end with clearance-recesses, pivoted spring-clips having inwardly-turned points adapted to enter said recesses, and a strip of blotting-paper extending longitudinally of the ruler along its under side with its terminals bent up and secured between the ruler and said clips at each end, substantially as set forth.

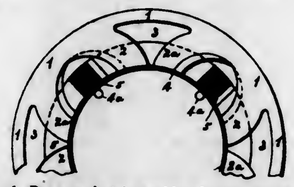
4. A ruler provided at each end with clearance-recesses, and pivoted spring-clips having inwardly-turned piercing-points adapted to enter said recesses, said clips extending outwardly beyond the ends of the ruler, substantially as set forth.

5. A ruler provided at each end with clearance-recesses and having spring-clips pivotally secured to the ruler at their inner ends provided with inwardly-turned piercing-points formed by pressing the metal downwardly in V form whereby the points are adapted to pierce through the terminal edges of a blotting-strip and into the clearance-recesses, substantially as set forth.



6. The combination with a ruler provided at each end with clearance-recesses and pivotally-mounted spring-clips having inwardly-turned piercing-points, of a strip of blotting-paper of uniform width bounded at each end by bias cuts terminating in narrowed extensions adapted to be bent upwardly around the ends and top of the ruler, and to be secured thereto, substantially as set forth.

811,812. DYNAMO-ELECTRIC MACHINERY. JOHN H. ST. HILL MAWDSLEY, Taunton, England. Filed Nov. 30, 1903. Serial No. 183,238.



Claim.—1. Dynamo-electric machines having magnetizing-coils each surrounding a pole-piece placed with their sides in the neutral zones and close to their armatures and at or about the middle of the interpolar spaces of contiguous poles and spaced away from the pole-cores.

2. In a dynamo-electric machine a field-magnet having each alternate pole-piece only provided with a magnetizing-coil, the said coils each surrounding a pole-piece and placed with its sides in the neutral zones and close to the armature and at or about the middle of the interpolar spaces of contiguous poles and spaced away from the pole-cores.

3. In a dynamo-electric machine, a trapezoidal field-magnet coil, the plane of the face of the coil being at right angles to the plane of rotation of the armature.

4. In a dynamo-electric machine, field-magnet coils of quadrilateral form and so placed that two of the sides cut the neutral zone at a slight angle and are spaced away from the pole-cores.

5. In a dynamo-electric machine a pole-piece having a trapezoidal face and split in a plane parallel and radial to the armature-shaft.

811,818. POST. JAY D. HENRY, Holbrook, Nebr. Filed June 9, 1905. Serial No. 264,693.

Claim.—1. A post comprising a cement body portion having an offset at one side thereof and openings extending through the post above the offset to permit of securing a member upon said offset by means of wires passing through said openings and around the supported member.

2. A post comprising a cement body having an offset and metallic tubes embedded in said body above the offset to permit of securing a member upon the same.

3. A post comprising a cement body, hollow metallic members embedded transversely therein for the reception of securing-wires and braced by wires running longitudinally of the post and coiling around said hollow members.

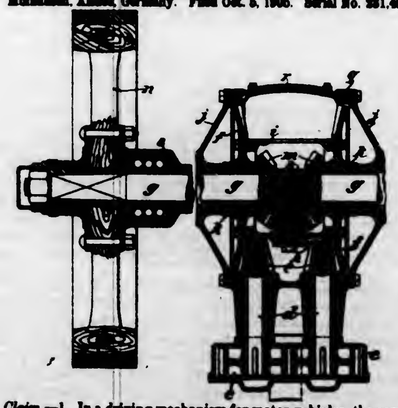
4. A post comprising a cement body, hollow metallic members embedded transversely therein for the reception of securing means, bracing-wires running longitudinally of the post and coiling around said hollow members, and transverse wires arranged therebetween and coiling around said longitudinal wires.

5. A post comprising a cement body, wires running longitudinally therein, extending outside said body and forming a ring or closed loop at such exterior point for hitching or similar purposes.

6. A post comprising a cement body, wires running longitudinally therein and secured together by transverse binding-wires, said longitudinal wires extending outside said body and forming a ring or closed loop at such extension or point for hitching or similar purposes.

7. A post comprising a cement body, wire running longitudinally therein, extending outside said body and forming a ring or closed loop at such exterior point for hitching or similar purposes.

811,314. DRIVING MECHANISM FOR MOTOR-VEHICLES. CHARLES B. MUFF, Mülhausen, Germany, assignor of one-half to The Firm of Ateliers de Constructions Mécaniques Clément Ducommun Mülhausen, Alsace, Germany. Filed Oct. 5, 1905. Serial No. 281,469.

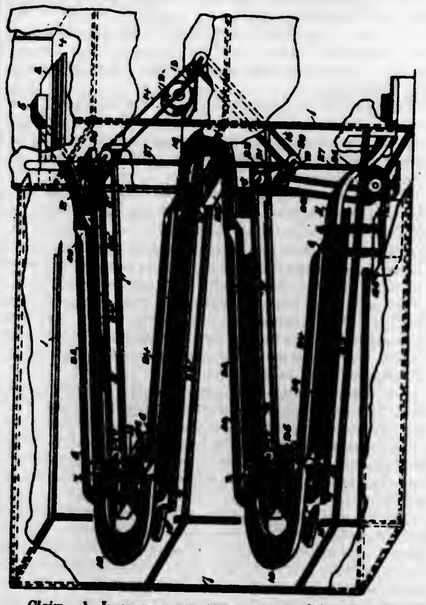


Claim.—1. In a driving mechanism for motor-vehicles, the combination with a divided driving-axle, and a differential gear thereon, of two bevel-wheels inclosing the differential gear between them and having their toothed peripheries opposed to one another, an intermediate sleeve rigidly connecting said bevel-wheels and carrying the planet-wheels of the differential gear, two bevel-pinions gearing respectively with said two bevel-wheels and intended to drive simultaneously both the latter, and means for imparting driving motion to both these bevel-pinions, substantially as, and for the purpose, hereinbefore described.

2. In a driving mechanism for motor-vehicles, the combination with a divided driving-axle, and a differential gear thereon, of two bevel-wheels inclosing the differential gear between them and having their toothed peripheries opposed to one another, an intermediate sleeve rigidly connecting said bevel-wheels and carrying the planet-wheels of the differential gear, two bevel-pinions gearing respectively with said two bevel-wheels and intended to drive simultaneously both the latter, two gear-wheels upon short spindles of said bevel-pinions, and a common driving-shaft for driving said gear-wheels and through them both the aforesaid bevel-wheels and differential gear, substantially as, and for the purpose, hereinbefore described.

3. In a driving mechanism for motor-vehicles, the combination with a divided driving-axle, and a differential gear thereon, of two bevel-wheels inclosing the differential gear between them and having their toothed peripheries opposed to one another, an intermediate sleeve rigidly connecting said bevel-wheels and carrying the planet-wheels of the differential gear, two bevel-pinions gearing respectively with said two bevel-wheels and intended to drive simultaneously both the latter, means for imparting driving motion to both these bevel-pinions and a protecting box or casing inclosing all said parts and also serving as a bearing for the same, substantially as, and for the purpose, hereinbefore described.

811,315. AMUSEMENT APPARATUS. FRANKLIN J. MCCANN, New York, N. Y., assignor of one-half to ANNI S. FR. BERQUIST and one-half to Frederick Tench, both of New York, N. Y. Filed Oct. 19, 1904. Serial No. 229,067.



Claim.—1. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels whereby a sudden descent from course to course is obtained in passing along the route, substantially as described.

2. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels whereby a sudden descent from course to course is obtained in passing along the route, and a waterway adjacent one or more of the courses, substantially as described.

3. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels whereby a sudden descent from course to course is obtained in passing along the route, and a waterway adjacent one or more of the courses, the waterway being constructed to provide rapids or falls, substantially as described.

4. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a moving carrier-belt, substantially as described.

5. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a moving carrier-belt, and a waterway adjacent one or more of the courses, said waterway being constructed to provide falls, substantially as described.

6. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, the first of said courses being sharply inclined to afford starting velocity, substantially as described.

7. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a carrier-belt and the next succeeding course including a slideway, substantially as described.

8. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a carrier-belt and the next succeeding course including a slideway, and a waterway adjacent one or more of the courses, said waterway being constructed to provide rapids or falls, substantially as described.

9. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a carrier-belt and the next succeeding course including a curved slideway, substantially as described.

10. In an amusement apparatus, a slide-route comprising a plurality of courses having adjacent ends at different levels, one of said courses including a carrier-belt and the next succeeding course including a curved slideway, and a waterway adjacent one or more of the courses, said waterway being constructed to provide rapids or falls, substantially as described.

11. In an amusement apparatus, a slide-route comprising a plurality of successive courses, one of said courses including a carrier-belt and the next succeeding course including a slideway, substantially as described.

12. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course including a slideway, substantially as described.

13. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course including a slideway, and a waterway adjacent one or more of the courses, said waterway being constructed to provide rapids or falls, substantially as described.

14. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course including a curved slideway, substantially as described.

15. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course including a curved slideway, and a waterway adjacent one or more of the courses, said waterway being constructed to provide rapids or falls, substantially as described.

16. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course including a slideway, the end of the first course being located above and overlapping the second, and the end of the second course being located above and overlapping the end of the third course, substantially as described.

17. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course a curved slideway, the end of the first course being located above and overlapping the second course, and the end of the second course being located above and overlapping the end of the third course, substantially as described.

18. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to afford starting velocity, the next succeeding course including a carrier-belt, and the next succeeding course a curved slideway, the end of the first course being located above and overlapping the second course, and the end of the second course being located above and overlapping the end of the third course, and a waterway adjacent one or more of the courses, said waterway being constructed to provide rapids or falls, substantially as described.

19. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to provide starting velocity, and alternating courses thereafter including carrier-belts and curved slideways, the route terminating in a sharply-inclined delivery-slideway, substantially as described.

20. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to provide starting velocity, and alternating courses thereafter including carrier-belts and curved slideways, the route terminating in a sharply-inclined delivery-slideway, and a waterway adjacent the route, substantially as described.

21. In an amusement apparatus, a slide-route comprising a plurality of courses, the first of said courses being sharply inclined to provide starting velocity, and alternating courses thereafter including carrier-belts and curved slideways, the route terminating in a sharply-inclined delivery-slideway, and a waterway adjacent the route, said waterway being constructed to provide falls or rapids at various points, substantially as described.

22. In an amusement apparatus, a slide-route comprising a sharply-inclined starting-slideway, a carrier-belt, the receiving end of which is below the delivery end of the starting-slideway, a curved slideway adjacent the delivery end of the belt, the receiving end of said slideway being below the delivery end of the belt, a second carrier-belt having its receiving end below the delivery end of the curved slideway, the route terminating in a sharply-inclined delivery-slideway, substantially as described.

23. In an amusement apparatus, a slide-route comprising a sharply-inclined starting-slideway, a carrier-belt, the receiving end of which is below the delivery end of the starting-slideway, a curved slideway adjacent the delivery end of the belt, the receiving end of said slideway being below the delivery end of the belt, a second carrier-belt having its receiving end below the delivery end of the curved slideway, the route terminating in a sharply-inclined delivery-slideway, and a waterway adjacent the route, substantially as described.

24. In an amusement apparatus, a slide-route comprising a sharply-inclined starting-slideway, a carrier-belt, the receiving end of which is below the delivery end of the starting-slideway, a curved slideway adjacent the delivery end of the belt, the receiving end of said slideway being below the delivery end of the belt, a second carrier-belt having its receiving end below the delivery end of the curved slideway, the route terminating in a sharply-inclined delivery-slideway, and a waterway adjacent the route, said waterway being constructed to provide falls or rapids at various points, substantially as described.

811,316. HOCKEY-BOOT. JAMES A. McPHERSON, Hamilton, Canada. Filed Mar. 28, 1904. Serial No. 200,497.

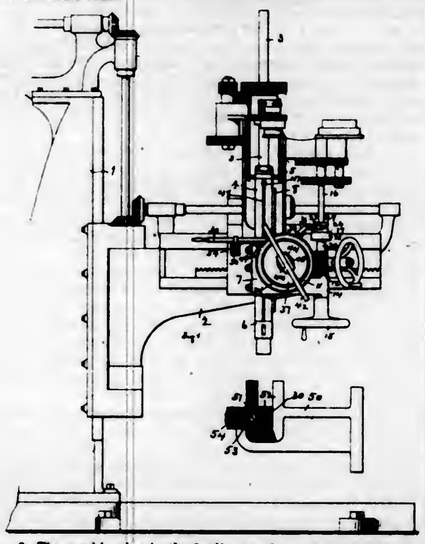
Claim.—1. The combination with a boot or shoe provided with an upper, of an ankle-support comprising a flexible material secured adjacent the rear seam of the boot, and consisting of flaps movable relative to the upper, one side of the upper provided with a slot, a fastening device located exteriorly of the upper and adjacent the slot, and a connection carried by the flap opposite the slotted upper, the connection adapted to pass through the slot in the upper and be engaged by the fastening device.

2. The combination with a boot or shoe provided with an upper slit longitudinally of its length and having fastening means located on either side the slit, of an ankle-support secured within the upper adjacent the rear seam thereof, the ankle-support provided with flaps movable relative to the upper, the ankle-support conforming approximately in shape to the shape of the upper, one of the flaps adapted to overlap the opposite flap, a strap carried by the first-named flap, that side of the upper opposite the strap-carrying flap being provided with a slot, a fastening device located adjacent the slot and exteriorly of the upper the strap adapted to pass through the slot and be engaged by the fastening device.

811,317. DRILL-PRESS. ALBERT H. NEWTON, Worcester, Mass. Filed Mar. 9, 1901. Serial No. 50,462.

Claim.—1. In the feeding mechanism of a drill-press, the combination with a pinion-shaft by which the drill-spindle is raised or lowered, a hub on the end of said pinion-shaft, means for rotating said shaft and comprising a clutching mechanism, a lever-handle pivotally connected at its center to said hub and diametrically to its axis and a cam-surface on said lever-handle, by which said clutching mechanism is engaged or disengaged by the rocking of said handle on its pivot.

2. The combination with the pinion-shaft of a drill-spindle-feeding mechanism, of a worm-gear turning loosely on said shaft and provided with a friction-flange, an expansible ring inclosed in said flange, a disk attached to said shaft and carrying said expansible ring, a radially-sliding ring-expanding pin, a sliding pin held concentrically in said shaft, a hub on the end of said shaft, a lever-handle pivoted at its central section to said hub and provided with a cam-surface engaging the end of said sliding pin, whereby said pin is moved in said shaft.



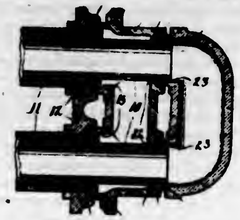
3. The combination in the feeding mechanism of a drill-press, of a pair of shafts with their axes in alinement, a clutching mechanism connecting the opposing ends of said shafts and comprising a series of rolls arranged to be wedged between the driving and driven members of said clutch, fingers inserted between said rolls, a sleeve concentric with the axis of the clutch and carrying said fingers, means for sliding said sleeve parallel with the axis of the clutch, means for rotating said sleeve during its sliding movement, substantially as described.

4. In the feeding mechanism of a drill-press, the combination of shafts 16 and 13, a roller-clutch connecting said shafts, a collar on one of said shafts provided with oblique grooves, a sleeve capable of sliding on said collar and engaging said oblique grooves, whereby a slight rotary movement is given to said sleeve during its sliding movement, fingers carried by said sleeve and extending between the rolls of said roller-clutch, substantially as described.

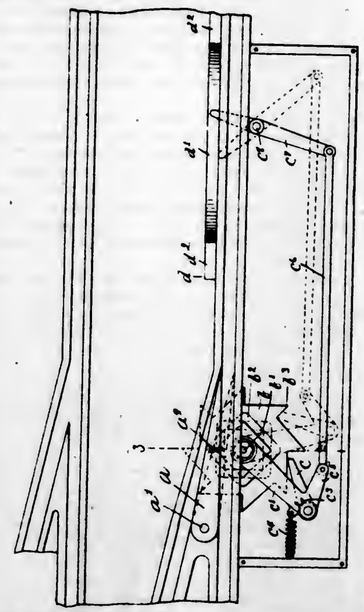
5. In the feeding mechanism of a drill-press, the combination of shafts 16 and 13, a clutching mechanism connecting said shafts and comprising driving and driven members and a series of wedging-rolls, of fingers extending between said rolls, a sliding sleeve concentric with one of said shafts and carrying said fingers, oblique grooves engaged by said sleeve, a pivoted shipping-lever engaging said sleeve and means controlled by the movement of the drill-spindle for rocking said lever, whereby said clutch is disengaged, substantially as described.

811,318. DOUBLE-PIPE RETURN-BEND. FRANCIS H. NILES, Chicago, Ill., assignor to Featherstone Foundry and Machine Company, Chicago, Ill., a Corporation. Filed Aug. 1, 1904. Serial No. 219,066.

Claim.—A double-pipe return-bend comprising the inner and outer pipe-sections, collars threaded to said outer pipes, an inner bend connecting said outer pipes fitted about the same at its inner portion and fitted about said inner pipes at its outer portion, an outer bend fitted about the ends of said inner pipes, packing-rings about said outer pipes, annular recesses in said collars for receiving said packing-rings, flanges on said inner bend extending within said recesses and holding said packing-rings in place against said outer pipes, annular recesses in said inner bend about the ends of said inner pipes, packing-rings in said recesses, cooperating flanges on said outer bend engaging said packing-rings and holding the same in place against said inner pipes, said outer and inner pipes having threaded portions engaged by said packing-rings, bolts connecting said bends and separate bolts connecting said inner bends and said collars, said bolts being arranged to draw said bends and collars together to compress the packing-rings, substantially as described.



811,319. RAILWAY-SWITCH. WILLIAM P. O'BRIEN, Salem, Mass. Filed July 24, 1905. Serial No. 270,941.



Claim.—1. The combination with a pivoted switch-arm, of a cam-grooved disk in engagement therewith, having ratchet-teeth, a pawl in engagement with the ratchet-teeth, a pawl-carrying arm, a pivoted actuating-lever to which said arm is connected and means under the control of the motorman for operating said lever, substantially as described.

2. The combination with a pivoted switch-arm, of a cam-grooved disk in engagement therewith, means for moving said disk intermittently, in the same direction, for moving the switch-arm back and forth, a pivoted actuating-lever having an exposed end, and means, mounted on the car, under the control of the motorman, for engaging the exposed end of said actuating-lever, substantially as described.

3. The combination with a pivoted switch-arm, of a cam-grooved disk in engagement therewith for moving said switch-arm back and forth, means for moving said disk intermittently, an actuating-lever for said means having an exposed end, a plate over which the exposed end of said lever extends, having a depression with inclined end walls, a spring-pressed plunger-rod on the car and means for operating it, substantially as described.

4. The combination with a pivoted switch-arm having a downwardly-extended pin, a cam-grooved disk located beneath said arm, the groove of which receives said pin, a pivoted actuating-lever for

said disk having an exposed end, and means mounted on the car, under the control of the motorman, for engaging the exposed end of said actuating-lever, substantially as described.

5. The combination with a pivoted switch-arm, of a device for moving it back and forth on its pivot, a pivoted actuating-lever connected with said device having an exposed end, a plate over which the exposed end of said lever extends, having a depression with inclined end walls, and means mounted on the car, under the control of the motorman, for engaging the exposed end of said lever, and a locking device for said means, substantially as described.

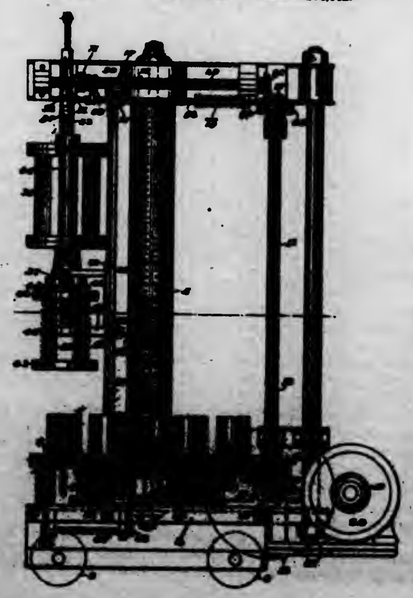
6. The combination with a pivoted switch-arm, of a device for moving it back and forth on its pivot, a pivoted actuating-lever connected with said device having an exposed end, a plate over which the exposed end of said lever extends, having an intermediate depression with inclined end walls and flat surfaces in continuation of said end walls, a plunger-rod on the car, under the control of the motorman, which is adapted to engage the said plate and to move said lever as it passes along on the plate, and a locking device for said plunger, substantially as described.

7. The combination with a pivoted switch-arm, of a device for moving it back and forth on its pivot, a pivoted actuating-lever connected with said device having an exposed end, a plate over which the exposed end of said lever extends, having an intermediate depression with inclined end walls, and flat surfaces in continuation of said end walls, a spring-pressed plunger mounted on the car adapted to engage the said plate and a locking-lever for said plunger, adapted to be operated by the motorman to release the plunger, substantially as described.

8. The combination with a pivoted switch-arm, of a device for moving it back and forth on its pivot, a pivoted actuating-lever connected with said device having an exposed end, a plate over which the exposed end of said lever extends having an intermediate depression with inclined end walls and flat surfaces in continuation of said end walls, a spring-pressed plunger mounted on the car adapted to engage the said plate, and a locking device into engagement with which said plunger is moved by the inclined wall of the plate, substantially as described.

9. The combination with a pivoted switch-arm having a downwardly-extended pin, a cam-grooved disk located beneath said arm, the groove of which receives said pin, and means for intermittingly moving said disk in the same direction, for moving said switch-arm back and forth, substantially as described.

811,820. GLASS-PRESS. WILLIAM I. PERHAM, Rochester, Pa., assignor to National Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Aug. 14, 1905. Serial No. 274,092.



Claim.—1. In a glass-press, the combination of a power-shaft, a rotatable table adapted to carry molds, a plunger and devices for reciprocating the same, devices for rotating the table, and frictional mechanism arranged between said table-rotating mechanism and said power-shaft; substantially as specified.

2. In a glass-press, the combination of a power-shaft, a rotatable table adapted to carry molds, a plunger and devices for reciprocating the same, devices for rotating the table, devices for locking the table, and friction devices arranged between said table-rotating mechanism and said power-shaft, substantially as specified.

3. In a glass-press, the combination of a rotatory mold-table and devices for imparting a rotatory movement thereto, a reciprocating plunger, a fluid-pressure cylinder and piston for reciprocating the plunger, a valve for admitting fluid-pressure to the cylinder, devices for operating the valve, and a check-valve for checking the exhaust during a portion of the stroke of the piston; substantially as specified.

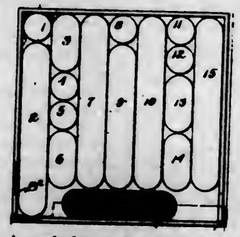
4. In a glass-press, the combination of a rotatory mold-table and devices for imparting a rotatory movement thereto, a reciprocating plunger, a fluid-pressure cylinder and piston for reciprocating the plunger, a valve for admitting fluid-pressure to the cylinder, devices for operating the valve, a check-valve for checking the exhaust during a portion of the stroke of the piston and devices for operating the check-valve; substantially as specified.

5. In a glass-press, the combination of a rotatory mold-table, devices for rotating the table, friction devices for communicating power to the table-rotating mechanism, a reciprocating plunger and devices for intermittently reciprocating the same, devices for locking the table, devices connected with the plunger for operating the lock, and devices for intermittently throwing the mechanism for reciprocating the plunger in and out of connection with power mechanism; substantially as specified.

6. In a glass-press, the combination of a rotatory mold-table, a reciprocating plunger, mechanism for operating the plunger, a positively-driven shaft for communicating power to start and stop the mechanism for operating the plunger, a hollow shaft surrounding the first shaft, a pinion fixed to the hollow shaft, a rack fixed to the table and meshing with the pinion, and a friction device for communicating power from the positively-moving shaft to the hollow shaft; substantially as specified.

7. In a glass-press, the combination of a rotatory mold-table and devices for rotating the same, power mechanism, a plunger and fluid-pressure devices for operating the plunger, a check-valve for checking a portion of the movement of the plunger, and devices for throwing the fluid-pressure-operating devices in and out of connection with the power mechanism; substantially as specified.

811,821. PUZZLE. EMIL C. PERLITZ, Boston, Mass., assignor to Clarence A. Hight, Brookline, Mass. Filed Nov. 13, 1904. Serial No. 232,317.



Claim.—1. A puzzle, having, in combination, a tray, a traveler adapted to move in a certain path therein, and a plurality of movable blocks of different forms in the tray acting as obstacles to the movement of the traveler in the tray and requiring rearrangement to permit its passage, substantially as described.

2. A puzzle, having, in combination, a tray, an elongated traveler adapted to move therein, and a plurality of movable blocks of equal width but unequal length, located in the tray and partly filling the same, the blocks acting as obstacles to the movement of the traveler in the tray, substantially as described.

3. A puzzle, having, in combination, a tray provided with a lateral opening, a traveler adapted to enter the opening and traverse the tray in a certain path, and a plurality of movable obstacles in the tray requiring rearrangement to permit the passage of the traveler and of a size too great to pass through the opening, substantially as described.

811,822. FOLDING CANOPY. JOHN A. POLHEMUS, East Rutherford, N. J. Filed May 18, 1905. Serial No. 260,794.

Claim.—1. A canopy for a marine vessel, comprising a fabric cover, an awning-frame for the cover, and fore and aft standards pivotally connected with the said awning-frame and with supports fixed on the deck of the vessel adjacent to the coaming, the standards being made in sections connected with each other by hinges arranged to allow the sections to swing into a folded horizontal position and away from the coaming.

2. A canopy for a marine vessel, comprising a fabric cover, an awning-frame for the cover, fore and aft standards pivotally connected with the said awning-frame and with supports fixed on the deck of the vessel adjacent to the coaming, the standards being made in sections connected with each other by hinges arranged to allow the sections to swing into a folded horizontal position and away from the coaming, and means for rigidly locking the said standard-sections in an extended position.

3. A canopy for a marine vessel, comprising a fabric cover, an awning-frame for the cover, a ridge-pole removably connected with the ends of the said awning-frame, and fore and aft standards pivotally connected with the said awning-frame and with supports fixed on the deck of the vessel adjacent to the coaming, the standards being made in sections connected with each other by hinges arranged to allow the sections to swing into a folded horizontal position and away from the coaming.

4. A canopy for a marine vessel, comprising a fabric cover, an awning-frame for the cover, a ridge-pole having forked ends removably engaging polygonal portions on the end bars of the awning-frame, and fore and aft standards pivotally connected with the said awning-frame and with supports fixed on the deck of the vessel adjacent to the coaming, the standards being made in sections connected with each other by hinges arranged to allow the sections to swing into a folded horizontal position and away from the coaming.

5. A canopy, comprising standards, bearings journaled in the upper ends of the standards, an awning-frame having its end members engaging the said bearings, a ridge-pole held on the end members of the said awning-frame, and a fabric cover stretched over the said ridge-pole and the said awning-frame.

6. A canopy, comprising fore and aft standards, bearings journaled in the upper ends of the said standards and having their axes in longitudinal alinement, an approximately rectangular awning-frame having its end members engaging the said bearings, a ridge-pole held on the end members of the said awning-frame, a fabric cover stretched over the said ridge-pole and the said awning-frame, and means for locking the bearings against turning in the said standards.

7. A canopy, comprising standards, bearings journaled in the said standards, an awning-frame having its end members engaging the said bearings, the end members having polygonal portions, and a ridge-pole having forked ends, each member of which is forked to and straddles the said polygonal portions.

8. A canopy, comprising standards, bearings journaled in the said standards, an awning-frame having its end members engaging the said bearings, the end members having polygonal portions, and a ridge-pole having forked ends, each member of which is forked to and straddles the said polygonal portions, the members of the forked ends extending on opposite sides of the bearings.

9. A canopy provided with a fabric cover, a ridge-pole, an awning-frame, and standards pivoted at their lower ends to a support and pivotally connected at their upper ends with the said awning-frame, each standard being in sections, hinges connecting the sections with each other, and means for locking the sections of a standard in an extended position.

10. A canopy for a marine vessel, comprising an awning-frame, a ridge-pole on the said frame, a fabric cover extending over the said frame and the said ridge-pole, bearings engaging the end members of the said awning-frame and having trunnions, standards pivotally connected at their lower ends to supports on the deck of the vessel outside of the coaming thereof, the said trunnions being journaled in the upper ends of the said standard, and means for locking the bearings against turning.

11. A canopy for a marine vessel, comprising an awning-frame, a ridge-pole on the said frame, a fabric cover extending over the said frame and the said ridge-pole, bearings engaging the end members of the said awning-frame and having trunnions, standards pivotally connected at their lower ends to supports on the deck of the vessel outside of the coaming thereof, the said trunnions being journaled in the upper ends of the said standards, the said standards being made in sections adapted to fold and to swing outwardly away from the coaming, and means for locking the bearings against turning.

12. A canopy having an approximately rectangular awning-frame provided with an auxiliary end member, the terminals of which are slidably connected with the longitudinal side bars of the said awning-frame, and a fabric cover secured at one end to the said auxiliary end member, to move with the same in the direction of the length of the awning-frame.

13. A canopy having an approximately rectangular awning-frame provided with an auxiliary end member, the terminals of which are slidably connected with the longitudinal side bars of the said awning-frame, and a fabric cover secured at one end to one end of the awning-frame and at its other end to the said auxiliary end member, to move with the same in the direction of the length of the awning-frame.

14. A canopy having an awning-frame provided with an auxiliary end member, slides mounted to slide on the side bars of the said awning-frame, the ends of the said auxiliary member being pivotally connected with the said slide, and a fabric cover secured at one end to one end of the awning-frame and attached at its other end to the said auxiliary member.

15. A canopy provided with standards, bearings pivoted in the said standards, a fabric cover and an awning-frame for the same, the awning-frame having its ends engaging the said bearings, and a ridge-pole straddling with its ends the ends of the said awning-frame.

16. A canopy provided with standards, bearings pivoted in the said standards, a fabric cover and an awning-frame for the same, the awning-frame having its ends engaging the said bearings, and a ridge-pole having forked ends straddling the ends of the awning-frame at opposite sides of the said bearings.

17. A canopy provided with a fabric cover and a frame for the same, the frame comprising a ridge-pole, an awning-frame and standards pivoted at their lower ends to a support and pivotally connected at their upper ends with the said awning-frame, each standard being in sections, hinges connecting the sections with each other, and adjustable abutments for the said standards.

18. A canopy for marine vessels, comprising an awning-frame, a fabric cover for the same, and means for supporting the frame and its cover at different levels and in transversely and longitudinally inclined positions the said means consisting of fore and aft standards hinged on the deck of the vessel and made in sections to fold independently one of the other, to allow either or both standards to fold at one time, and bearings journaled in the upper ends of the standards and having their axes in longitudinal alinement, the ends of the said awning-frame being held in the said bearings for the awning-frame and its cover to swing transversely into an inclined position.

19. A canopy for marine vessels, comprising fore and aft standards hinged at their lower ends to a fixed support, to swing in a longitudinal direction toward and from each other, each standard being made in sections hinged together to fold one upon the other, an awning-frame, a cover for the same, and bearings journaled in the free ends of the said standards and engaged by the end members of the said awning-frame for the latter to swing in a transverse direction.

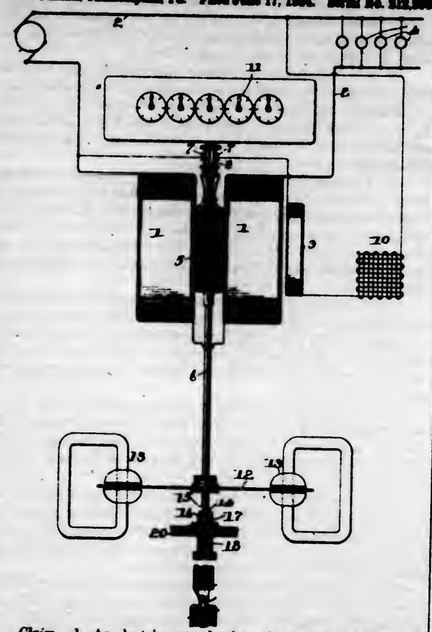
20. A canopy for marine vessels, comprising an awning-frame, a cover for the same, and fore and aft standards hinged at their lower ends to fixed supports at the ends of the cockpit of the vessel, the said standards carrying the said awning-frame and each being made in sections hinged together to fold one upon the other and when folded, being outside of the cockpit of the vessel.

21. A canopy for marine vessels, comprising an awning-frame, a cover for the same, fore and aft standards hinged at their lower ends to fixed supports at the ends of the cockpit of the vessel, each standard being made in sections hinged together to fold one upon the other, and when folded, being outside of the cockpit of the vessel, and bearings journaled in the upper ends of the said standards and having their axes alined longitudinally, the said awning-frame having its end members engaging the said bearings.

22. A canopy comprising folding standards, an awning-frame made approximately rectangular and having a U-shaped auxiliary member, the terminals of which are slidably connected with the side bars of the said awning-frame, and a fabric cover for the said awn-

ing-frame secured at one end to one end of the awning-frame and attached at its other end to the said auxiliary member.

811,323. ELECTRIC METER. EDWIN H. FORMAN and EMILIUS CRAMER, Philadelphia, Pa. Filed June 17, 1904. Serial No. 212,892.



Claim.—1. An electric meter having a bearing of sapphire, the meter-spindle having an end also of sapphire engaging said bearing, substantially as described.

2. An electric meter having a bearing of crystalline stone, the meter-spindle having an end of sapphire engaging said bearing, substantially as described.

3. An electric meter having a bearing of stone, the meter-spindle having an end of sapphire engaging said bearing, substantially as described.

4. An electric meter having a bearing of sapphire, the meter-spindle having an end of crystalline stone engaging said bearing, substantially as described.

5. An electric meter having a bearing of sapphire, the meter-spindle having an end of stone engaging said bearing, substantially as described.

6. An electric meter having a bearing of corundum, the meter-spindle having an end also of corundum engaging said bearing, substantially as described.

7. An electric meter having a bearing of crystalline stone, the meter-spindle having an end of corundum engaging said bearing, substantially as described.

8. An electric meter having a bearing of stone, the meter-spindle having an end of corundum engaging said bearing, substantially as described.

9. An electric meter having a bearing of corundum, the meter-spindle having an end of crystalline stone engaging said bearing, substantially as described.

10. An electric meter having a bearing of corundum, the meter-spindle having an end of stone engaging said bearing, substantially as described.

11. An electric meter having a bearing of sapphire, the meter-spindle having an end of corundum engaging said bearing, substantially as described.

12. An electric meter having a bearing of crystalline stone, the meter-spindle having an end of crystalline stone engaging said bearing, substantially as described.

13. An electric meter having a bearing of crystalline stone, the meter-spindle having an end of stone engaging said bearing, substantially as described.

14. An electric meter having a bearing of stone, the meter-spindle having an end of crystalline stone engaging said bearing, substantially as described.

15. An electric meter having a bearing of corundum, the meter-spindle having an end of sapphire engaging the bearing, substantially as described.

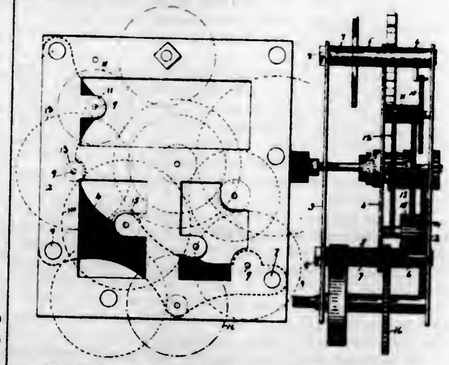
16. An electric meter having a bearing of stone, the meter-spindle having an end of stone engaging said bearing, substantially as described.

17. An electric meter having a stone bearing, the meter-spindle having an end of similar stone engaging said bearing, substantially as described.

18. An electric meter having a crystalline-stone bearing, the meter-spindle having an end of similar crystalline stone engaging said bearing, substantially as described.

19. In a device of the character described, a stationary element and a movable element to contact therewith, both of said elements being jeweled at their contacting places.

811,324. CLOCK. WILSON B. PORTER, New Haven, Conn., assignor to New Haven Clock Co., New Haven, Conn., a Corporation. Filed Feb. 16, 1905. Serial No. 245,899.



Claim.—In a clock, the combination with sheet-metal front and back movement-plates, of a sheet-steel supplemental plate located between the same, arbors extending between and journaled at their respective ends in the said front and rear movement-plates, short arbors journaled at their respective ends in the supplemental movement-plate and in one or the other of the front and back movement-plates, and wheels and pinions mounted upon the arbors last mentioned so as to turn thereupon independently thereof, the said wheels and pinions being made of a softer metal than the said short arbors.

811,325. HEATER. WILLIAM H. RAMALEY and WILLIAM B. LANSTON, Pittsburg, Pa. Filed Apr. 8, 1905. Serial No. 254,807.

Claim.—1. In a heater of the type described, the combination with a shell having an air-inlet, a plurality of flues carried by said shell, a burner-casing mounted within said shell, a heating-casing supported within said shell, angularly-disposed flues establishing communication between said casings, said heating-casing having a circular heating-compartment formed therein, a perforated partition horizontally mounted within said compartment, vertically-disposed flues passing through said compartment and said partition, and an exhaust-flue communicating with said heating-casing, substantially as described.

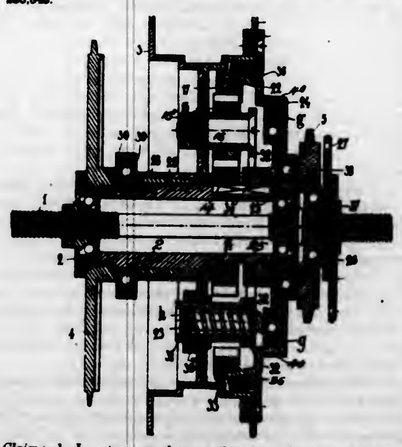
2. In a heater of the type described, the combination with a shell having an air-inlet, a plurality of flues carried by said shell and a burner-casing mounted within said shell, said burner-casing being of annular form, and burners extending into said burner-casing, of a heating-casing arranged in said shell above the burner-casing, said heating-casing being of annular form, a horizontal perforated partition arranged in said heating-casing, and said heating-casing being provided with a plurality of flues extending from the bottom thereof through said partition to the top thereof.

811,326. ADJUSTABLE COLLAR-SUPPORTER. FRED S. REYNOLDS, Cranston, R. I. Filed Oct. 16, 1905. Serial No. 283,894.

Claim.—1. In a device of the character described, the combination of two reversely-arranged superimposed interlocking resilient bar members in slidable frictional engagement with each other, means integral with said members for maintaining them in an adjusted position, and a button or cap detachably secured to each end of the device, for the purpose herein set forth.

2. The adjustable collar-supporter A herein described, the same consisting of two reversely-arranged flat superimposed thin sheet-metal resilient bar members a a', each having an end thereof arranged to receive and form a guide for the shank portion of the fellow bar, said bars being slidably or adjustably movable upon each other in an endwise direction, means integral with the bars for holding them in adjusted positions, and caps or buttons c removably secured to the outer ends of the collar-supporter.

811,327. TRANSMISSION MECHANISM FOR MOTOR-CYCLES. LOUIS C. G. RIVIERRE, Paris, France. Filed Oct. 31, 1904. Serial No. 230,843.



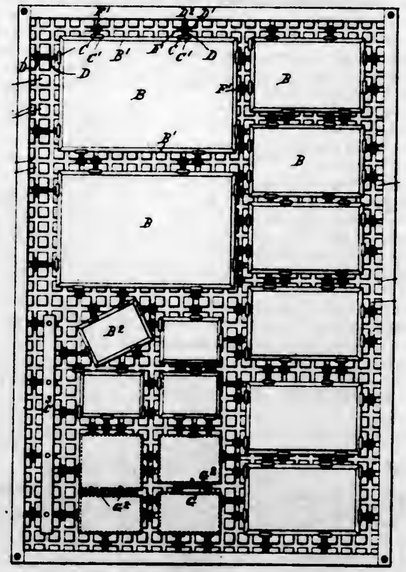
Claim.—1. In a two-speed transmission mechanism, in combination, a fixed axle, a hollow spindle rotatable thereon, sprockets carried by said spindle, a hub rotatable on said spindle, a pinion carried by said spindle, planetary pinions on said hub engaging said pinion, a member rotatable on said spindle and adapted to be frictionally locked to said hub, a gear on said member meshing with said planetary pinions, and means for braking said friction member.

2. In a transmission mechanism for motor-cycles, in combination, a fixed axle, a hollow spindle rotatable thereon, sprockets carried by said spindle, a hub rotatable on said spindle, a cone-ring attached to said hub, planetary pinions carried by said hub, a pinion on said spindle meshing with said planetary pinions, a cone member rotatable on said spindle and having an internally-toothed crown meshing with said pinions, means for shifting said cone member into and out of engagement with said cone-ring, and means for braking said cone member.

3. In a transmission mechanism for motor-cycles, in combination, a fixed axle, a tubular spindle rotatable thereon, sprockets carried by said spindle, a hub rotatable on said spindle and carrying a cone-ring, a pinion fixed to said spindle, planetary pinions on said hub engaging said pinion, a cone member rotatable on said spindle and axially shiftable thereon, a toothed ring carried by said cone member and engaging said pinions, springs carried by said hub for normally maintaining said cone member in engagement with said cone-ring, means for shifting said cone member against the action of said springs, and means for braking said cone member.

4. In a transmission mechanism for motor-cycles, in combination, a fixed axle, a hollow spindle rotatable thereon, sprockets carried by said spindle, a hub rotatable on said spindle, a cone-ring carried by said hub, planetary pinions journaled at one side of said hub, a pinion on said hub meshing with said first-named pinions, an internally-toothed cone member rotatable on said spindle and meshing with said pinions, means for braking said cone member, means for normally maintaining said cone member in engagement with said cone-ring, and means for axially shifting said cone member in either direction.

811,328. PRINTING-PLATE HOLDER. CHARLES F. ROCKSTROH, Brooklyn, N. Y., assignor to Rockstroh Manufacturing Company, Brooklyn, N. Y., a Corporation of New Jersey. Original application filed Oct. 23, 1903, Serial No. 178,825. Divided and this application filed Dec. 21, 1903. Serial No. 186,143.



Claim.—1. The expansible spacer, G^3, for a printing-plate holder having slots therein, having one or more tongues fitted loosely in the slots in the holder and consisting of the sections, G^3, G^4, which are loosely connected together, and the wedge, G^5, fitted between them so as to give a lateral expansion of dimensions to the spacer, and all combined, as specified.

2. The expansible spacer, G^3, for a printing-plate holder having slots therein, consisting of the section, G^3, having its upper extremity, G^9, half dovetail in shape to fit in the clamp-groove, B^6, of the plate, B^5, and having a lateral projection, G^{16}, and a dowel-pin, G^{13}, in its lower extremity, G^{14}, which is doweled in the lower extremity, G^{15}, of the corresponding section, G^4, of the device, which is also shaped at its upper extremity G^2 dovetail in section to fit in a corresponding groove, B^4, of the plate, B^5, and the wedge, G^5, fitted between the two sections, and provided with the rib, G^6, the limiting-pin, G^8, and the hole, G^{17}, and the screw, G^{10}, fitted to the section, G^4, and loosely fitted through the section, G^3, and the tension-spring, G^{11}, between the section, G^3, and the screw-head, G^{12}, and all combined, as specified.

3. The expansible spacer, G^3, for a printing-plate holder having slots therein, consisting of the sections, G^3, G^4, and the wedge, G^5, as a means for changing its lateral dimensions while in position upon the holder, and all combined, as specified.

4. In a printing-plate holder having undercut V-shaped grooves therein, a spacer, comprising a plate adapted to set between printing-plates secured to the surface of the holder and having tongues each with a shank extending down into and a part broadened to conform generally to said undercut V-shaped grooves providing shoulders for attachment of the spacer to the plate-holder.

5. In a curved printing-plate holder having undercut V-shaped grooves therein, a spacer comprising a curved plate adapted to set between curved printing-plates secured to the curved surface of the holder, and having tongues each with a shank extending down into, and a part broadened to conform generally to said undercut V-shaped grooves providing shoulders for attachment of the spacer to the plate-holder.

6. An expansible sectional spacer, for a curved printing-plate holder, provided with the tongue, G′, as a means for its attachment to the holder and its upper portion being provided with the wedge, G^2, as a means for changing its thickness laterally, as specified.

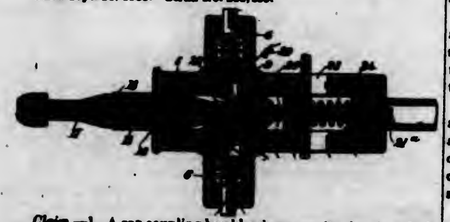
7. The curved expansible spacer, G^3, for a curved printing-plate holder, consisting of the sections, G^3, G^4, having the tongue, G′, as a means for its attachment in the slots therein, and the wedge, G^5, for changing the lateral dimension of the spacer, and all combined, as specified.

8. In a printing-plate holder, an expansible spacer consisting of a pair of similar yieldingly-connected members constructed for engagement with the slots of the plate-holder and for opposite contact with plates to be held to the plate-holder, and a wedge fitted between parts of the spacer to give lateral expansion to the dimensions thereof.

9. The combination with a printing-plate holder having series of undercut slots, of an expansible spacer, consisting of a pair of similar yieldingly-connected members having parts adapted to pass into said slots and interlock therewith and parts adapted to lie above the surface of the printing-plate holder and to engage edge grooves of said printing-plates, the inner opposite faces of the latter parts being grooved and a wedge fitting between said latter parts and movable along said grooves to give lateral expansion to the dimensions thereof.

10. The combination with a printing-plate holder having series of undercut V-shaped slots, of an expansible spacer, consisting of a pair of similar yieldingly-connected members having tongues adapted to pass down into and broadened to conform generally to said slots and interlock therewith, and parts adapted to lie above the surface of the printing-plate holder and to engage edge grooves of said printing-plates, the inner opposite faces of the latter parts being grooved and a wedge fitting between said latter parts and movable along said grooves to give lateral expansion to the dimensions thereof.

811,829. **CAR-COUPLING.** JAMES ROONEY, New York, N. Y. Filed Sept. 26, 1905. Serial No. 280,463.



Claim.—1. A car-coupling head having opposite chambered offsets, spring-pressed locking-blocks movable in said offsets electric circuit-closing devices carried by the blocks, the lower wall of the head being provided with slots, pins extended from the locking-blocks through said slots, and an operating wheel or plate on the lower side of the head; the said wheel or plate having opposite slots, the walls of said slots being eccentric or cam-shaped for engaging with the pins.

2. A car-coupling comprising a hollow head having chambered offsets, the outer walls of said offsets being provided with slots, locking-blocks movable in the chambers of the offsets and having stem portions passing through said perforations, springs arranged between the end walls of the chambers and the blocks, the bottom wall of said head being slotted, pins passing from the blocks through said slots, an operating wheel or plate pivoted on the lower side of the head and having opposite slots provided with inner eccentric walls with which said pins engage, a tubular link for engaging with said blocks, and a spring-pressed tube for engaging with said link for connecting the same.

3. A hollow coupling-head, locking-blocks movable therein electric circuit-closing devices carried by the blocks, a tubular link for engaging in said blocks, the end of the link being counterbunk, and a spring-pressed tube in the head having its end corresponding to said counterbunk portion thus forming a ball-and-socket joint.

4. A hollow coupling-head having a chamber in its rear portion, the opposite side walls having slots leading from said chamber, laterally-movable locking-blocks in said head, a tubular link having a head portion for engaging with said blocks, a tube adapted to engage its end with said tubular link, branch pipes extended outward from said tube into said slots, an extension from the tube and a spring arranged in the chamber around the extension one end of said spring engaging with the end wall of the chamber, while the other end engages the said branch pipes.

811,880. **PRESSURE AND SUCTION DEVICE.** EUGEN ROTH, Schöneberg, near Berlin, Germany. Filed May 6, 1904. Serial No. 206,789.

Claim.—1. In combination, a cylinder, an air-chamber therein, an elastic diaphragm in said cylinder, a nest of rings contacting the diaphragm, and levers contacting said rings, substantially as described.

2. In an apparatus of the character specified, the combination of an air-chamber having a yielding flexible diaphragm, and a nested series of devices fitting to and movable with said diaphragm, adapted to prevent rupture thereof, substantially as described.

3. In an apparatus of the character described, an air-tight chamber having a yielding wall, and devices conformable to and movable with said wall, but preventing disruption thereof; with levers contacting said devices and a reciprocatory rod operated by the levers, substantially as described.

4. In an apparatus of the character described, an air-tight chamber having an elastic flexible wall, and a series of devices conforming to and movable with said wall, to prevent disruption thereof; with levers contacting said devices, a reciprocatory rod, and an operative connection between the rod and levers, substantially as described.

5. In an apparatus of the character specified, the combination of an air-chamber having a yielding flexible diaphragm, and a nested series of devices fitting to and movable with said diaphragm, adapted to prevent rupture thereof; with a reciprocatory rod, and a disk thereon actuated by said devices, substantialy as described.

6. In an apparatus of the character specified, the combination of an air-chamber having a flexible diaphragm, and devices fitting to and movable with said diaphragm, adapted to prevent rupture thereof; with radially-arranged levers contacting said devices, a reciprocatory rod, and a disk thereon contacting the free ends of said levers, substantially as described.

7. In combination, a cylinder, an air-chamber therein, a flexible diaphragm within said cylinder closing said chamber, a series of devices contacting said diaphragm, levers contacting said devices, a reciprocatory rod, and a disk on the inner end of said rod contacting said levers, all substantially as and for the purpose described.

8. In combination, a cylinder, an air-chamber at the bottom thereof, an elastic diaphragm within said cylinder closing said chamber, a nested series of rings contacting said diaphragm, a radial series of levers contacting said rings, a reciprocatory rod, and a disk on the inner end of said rod contacting said levers, all substantially as and for the purpose described.

811,881. **RULING-MACHINE.** FRANK E. RUDOLPH, Omaha, Nebr., assignor of one-half to The Carpenter Paper Company, Omaha, Nebr. Filed July 27, 1903. Serial No. 167,476.

Claim.—1. In a paper-ruling machine, means for holding a plural number of rolls of paper, a single pair of feed-rollers for drawing all the webs of paper from the rolls, ruling devices past which the webs of paper from each roll are drawn by the feed-rollers, means on the feed-rollers for perforating the webs in transverse lines, and means subsequently engaging the webs for dividing the same into sheets along the transverse lines of perforation.

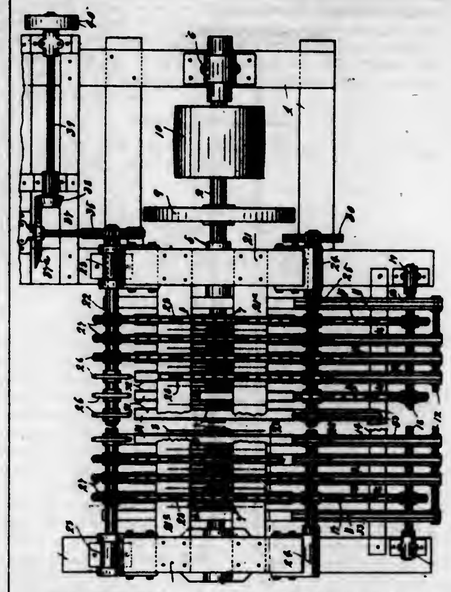
2. In a paper-ruling machine the combination with feed-rollers, paper-roll supports, and ruling devices for simultaneously ruling a plural number of webs of paper, means for dividing the webs into sheets, and means for depositing all the sheets in a single pile, of means for marking one of the webs at predetermined intervals thereon, said means comprising a cam movable with one of the feed-rollers, a lever actuated thereby, a pawl carried by the lever, a ratchet moved intermittently by said pawl, marking devices arranged adjacent the paper web, and means carried by the ratchet for actuating the marking devices.

3. In a paper-ruling machine, means for holding a plural number of rolls of paper, ruling devices past which webs of paper from each of said rolls may be drawn, tension devices for retarding the unrolling of the webs from the rolls, a single pair of feed-rollers for drawing all of the webs from the rolls past the ruling devices, means carried by the feed-rollers for perforating the webs in transverse lines at regular intervals thereon, and means engaging the webs subsequent to their passage between the feed-rollers, said means being adapted to advance the webs at a greater speed than the feed-rollers, whereby the webs are broken into sheets along the lines of perforation thereof.

4. In a paper-ruling machine the combination with means for supporting a plural number of rolls of paper, and a plural number of ruling devices past which webs of paper from the rolls may be drawn, of a single pair of feed-rollers for drawing all of the webs from the rolls past the ruling devices, means on the feed-rollers for perforating the webs in transverse lines, and means for breaking the webs into sheets along the transverse lines of perforation, said means depositing all of the sheets in a single pile.

811,882. **BLOCK-SAWING MACHINE.** HERMAN RUFLI, Indianapolis, Ind., assignor of one-half to Alexander W. Van Hafften, Minneapolis, Minn. Filed Mar. 17, 1905. Serial No. 250,516.

Claim.—1. The combination with a feed-deck, and a plurality of laterally-spaced saws projecting through said deck, of a primary feed device and a secondary feed device, said primary feed device comprising a pair of sprocket-equipped shafts and cooperating sprocket-chains, one of said shafts carrying a spur-gear, and said secondary feed device comprising a frame, pivoted for movement into an inoperative position, a pair of sprocket-equipped shafts and sprocket-chains running over the sprockets of said shafts, the shaft at the free end of said frame having a spur-gear that normally meshes with the spur-gear of said aforenoted sprocket-shaft, substantially as described.



2. In a machine of the character described, the combination with a plurality of saws, on a common arbor, of a feed-deck, through which said saws project, said deck being pivoted for movement into a position clear of said saws, and an overlying feed device comprising a frame pivoted for movement into an inoperative position, and an endless feed-belt mounted on said pivoted frame, substantially as described.

3. In a machine of the character described, the combination with a plurality of saws on a common arbor, of a pivoted feed-deck made up of a plurality of bars passing between said saws, a primary feed-belt made up of a plurality of sprocket-chains, working between the bars of said deck and provided with push-lugs, and an overlying secondary feed-belt comprising a plurality of sprocket-chains having push-lugs, and which secondary feed-belt is pivotally mounted for movement to and from an operative position, substantially as described.

4. In a machine of the character described, the combination with a saw-arbor having a plurality of laterally-spaced saws, removable therefrom by movements longitudinally thereof, of a pivoted feed-deck having a plurality of bars extending between said saws, a pivoted frame overlying said feed-deck and said saws, sprocket-equipped shafts mounted on said pivoted frame, and sprocket-chains running over the sprockets of said shafts and provided with push-lugs working between said saws, substantially as described.

811,883. **PANTOGRAPH.** ALFRED SHAKER, Chicago, Ill. Filed June 2, 1905. Serial No. 263,457.

Claim.—1. In a pantograph, in combination, an anchor; a pencil-holder; a coil-spring having each of its ends connected respectively to one of each parts, one of the connections being adapted to prevent the rotation of the spring; and a tracing-point carried by the spring.

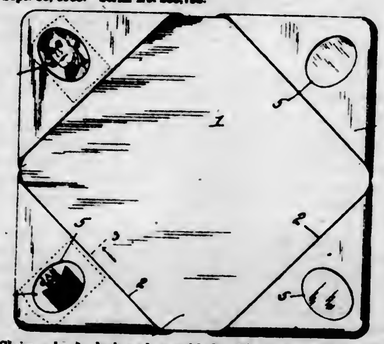
2. In a pantograph, in combination, an anchor; a pencil-holder; a coil-spring having each of its ends connected respectively to one of each parts, one of the connections being adapted to prevent the rotation of the spring; a clip for frictionally engaging the spring; and a tracing-point carried by the clip.

3. In a pantograph, in combination, an anchor; a pencil-holder; a longitudinally-elastic connecting member; a tracing-point carried by the elastic member; and hook-and-eye connections for the elastic member with the anchor and pencil-holder, such connections being disposed to impart the desired direction to the tracing-point.

4. In a pantograph, in combination, an anchor, a pencil-holder,

a coil-spring connecting such parts, the connection between the spring and one of the parts being by means of a hook and eye, and a tracing-point carried by the spring.

811,334. DESK-PAD. ISAAC SENDEL, East Orange, N. J. Filed Sept. 30, 1905. Serial No. 280,786.



Claim.—1. A desk-pad provided with main corner-pockets adapted to receive the corners of a blotter, the top pieces of said corner-pockets being formed with supplemental pockets open at the inner edges of said main pockets, openings being formed through the tops of said main pockets into the supplemental pockets, whereby the contents of the supplemental pockets may be viewed through the openings in th tops of the main pockets.

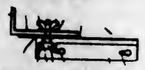
2. A desk-pad provided with main corner-pockets formed with top pieces, and supplemental pockets formed in said top pieces.

3. A desk-pad provided with main corner-pockets formed with top pieces and supplemental pockets formed in said top pieces, the entrance to said supplemental pockets being at the inner edges of said top pieces, said top pieces being formed with openings through which the contents of the supplemental pockets may be viewed.

4. A desk-pad provided with main pockets at its corners, the top piece of one of said pockets being provided with a supplemental pocket, an opening being formed in said main pocket through which the contents of said supplemental pocket may be viewed.

811,335. ADJUSTABLE BRACKET. BENJAMIN H. STAUFFENBERG, Germantown, Pa. Filed Nov. 23, 1904. Serial No. 234,023.

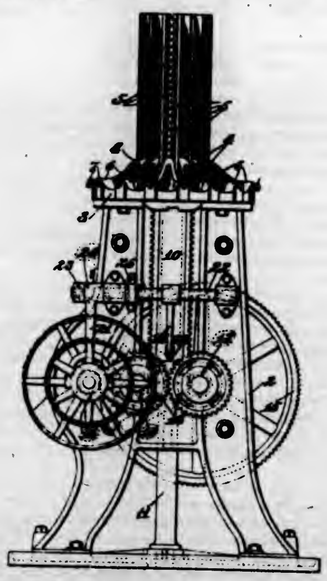
Claim.—1. An adjustable bracket comprising two generally triangular parts each provided at or near its apex with a substantially flat lateral face and with an oblong opening perpendicular to its supporting edge, and a single clamping-bolt penetrating both openings, substantially as described.



2. An adjustable bracket comprising an arm having a supporting-base and a substantially flat lateral contact-face and an oblong opening, a support having a bearing edge trending in the direction of the bracket and a substantially flat lateral contact face and an oblong opening, and a single bolt penetrating said opening and adapted to clamp and unclamp said contact-faces whereby the support is capable of rotary and linear adjustment in one plane, substantially as described.

3. An adjustable bracket comprising an arm having a perforated flange or base and an oblong opening, a flat contact-face on one side of said opening and ways on the other side of said opening, a support having a bearing edge trending in the direction of the bracket and an oblong opening and a substantially flat contact-face on each side of the last-mentioned opening, and a single clamping-bolt penetrating said openings and having its head arranged in said ways, substantially as described.

811,336. MACHINE FOR CUTTING GEAR-WHEELS. FRANCIS M. STANBAUGH, St. Louis, Mo., assignor to The American Brake Company, St. Louis, Mo., a Corporation of Missouri. Filed Mar. 7, 1906. Serial No. 305,845.



Claim.—1. In a machine of the class described, the combination with a base, of a cap-piece above the base provided with slots diverging from the center and having a central opening, a cutter-head alining with the opening, a plurality of teeth-cutting blades pivotally connected to said cutter-head and arranged in circular series thereon, said blades being guided in the slots in the cap-piece, and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical plane, and means for actuating the cutter-head to move the blades into a vertical plane for cutting the teeth; substantially as described.

2. In a machine of the class described, the combination with a base, of a cap-piece above the base provided with slots diverging from the center and having a central opening, a cutter-head alining with the opening, a plurality of teeth-cutting blades pivotally connected thereto, said blades being guided in the slots in the cap-piece and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical position, and means for actuating the cutter-head to move the blades into a vertical plane for cutting the teeth, and for imparting a vertical reciprocatory movement to said blades when acting upon the material to be cut; substantially as described.

3. In a machine of the class described, the combination with a base, of a cap-piece above the base provided with slots diverging from the center and having a central opening, a cutter-head alining with the opening, a plurality of teeth-cutting blades pivotally connected to said cutter-head and arranged in circular series thereon, said blades being guided in the slots in the cap-piece, and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical plane, means for actuating the cutter-head to move the blades into a vertical plane for cutting the teeth, and a work-holding device concentric with the cutter-head; substantially as described.

4. In a machine of the class described, the combination with a frame having a central opening, a work-holder alining with the opening, a series of blades arranged around the opening, guiding means for said blades, and a reciprocatory actuating device concentric with the opening and having said blades pivotally connected thereto, the pivots of said blades being normally above said guiding means to enable said blades to lie in an approximately horizontal plane, said device being capable of moving the blades to a vertical plane and thence transversely across the material to be cut; substantially as described.

5. In a machine of the class described, a frame, a cap-piece mounted on said frame and provided with a central opening, a plurality of slots formed in said cap-piece and diverging from said central opening toward the periphery of the cap-piece, a reciprocating cutter-head alining with the central opening and having a plurality of teeth-cutting blades pivotally connected thereto, said blades being guided in the slots in the cap-piece and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical position, and blocks bearing against said blades during the downward stroke of the cutter-head to hold said blades in a vertical position; substantially as described.

6. In a machine of the class described, a frame, a cap-piece mounted on said frame and provided with a central opening, a plurality of slots formed in said cap-piece and diverging from said central opening toward the periphery of the cap-piece, a reciprocating cutter-head alining with the central opening and having a plurality of teeth-cutting blades pivotally connected thereto, said blades being guided in the slots in the cap-piece and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical position, and adjustable blocks bearing against said blades during the downward stroke of the cutter-head to hold said blades in a vertical position; substantially as described.

7. In a machine of the class described, a frame, a cap-piece mounted on said frame and provided with a central opening, a plurality of slots formed in said cap-piece and diverging from said central opening toward the periphery of the cap-piece, a reciprocating cutter-head alining with the central opening and having a plurality of teeth-cutting blades pivotally connected thereto, said blades being guided in the slots in the cap-piece and the pivots of said blades being above the cap-piece when the cutter-head is at the end of its upward stroke thereby enabling said blades to move out of a vertical position, and blocks adjustably mounted in the side walls of said slots and provided with rollers which bear against the outer edges of said blades during the downward stroke of the cutter-head to hold said blades in a vertical position; substantially as described.

8. In a machine of the class described, the combination with a work-holder, of a cutter-head surrounding said work-holder and having a head provided with peripherally-arranged slots forming upstanding projections, grooves in the upstanding projections, a series of blades arranged in circular series and having trunnions at their lower ends journaled in the grooves in said projections, removable blocks for closing the ends of the grooves, means for holding said blocks in position, and means for reciprocating the cutter-head; substantially as described.

9. In a machine of the class described, the combination with a work-holder comprising a post having a work-engaging end, a reciprocatory cutter-head surrounding said work-holder and having slots in one end, pivoted teeth-cutting blades carried in said slots, a cap-piece surrounding the blades and cutter-head and having guide-grooves, and blade-pressing adjustable blocks working in the guide-grooves in the cap-piece; substantially as described.

10. In a machine of the class described, the combination with a work-holding post, a cutter-head surrounding said post, cutting-blades pivotally carried by said cutter-head, a cap-piece having an opening of greater diameter than the diameter of the cutter-head, and slidably blade-pressing blocks carried by said cap-piece; substantially as described.

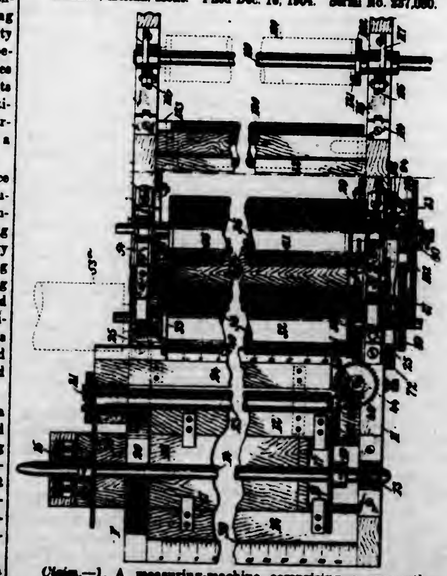
811,337. LAP-ROBE. LOUIS S. STRODOK, New York, N. Y. Filed Mar. 28, 1905. Serial No. 252,681.

Claim.—1. A lap-robe comprising a front piece, a lining, a cover, the robe being provided with a plurality of longitudinal openings parallel with each other, the cover on the outside of the robe extending from one of said openings to the other, and a plurality of flaps integrally connected with said cover and secured to the robe one over each opening, the robe having a passage between the openings constituting a muff, said passage being closed on lines extending from the top of one opening to the top of the next and from the bottom of one opening to the bottom of the next.

2. A lap-robe comprising a front piece, a lining and a cover, said robe being provided with a plurality of longitudinal openings and a plurality of flaps connected with said cover, one projecting over each opening, the robe having a passage between the openings constituting a muff, and the front piece constituting the rear wall of said passage.

3. A lap-robe having a piece of fabric secured to the front thereof along lines at the upper and lower edges of said piece of fabric, and provided with openings near the ends of said piece and with flaps integral with the piece of fabric and covering the openings.

811,338. CUTTING AND MEASURING MACHINE. ALFRED P. SWEENY, Helena, Mont. Filed Dec. 16, 1904. Serial No. 237,090.



Claim.—1. A measuring-machine comprising a supporting-frame, a rotatable measuring member journaled upon the frame and weighted at one portion of its periphery for overcoming the inertia of said member, and means for locking the measuring member with its weighted portion at one side of the vertical through its journals.

2. A measuring-machine comprising a generally cylindrical measuring-roll having a flattened portion.

3. A measuring-machine comprising a supporting-roll, a rotatable roll having a flattened portion, and means for locking the last-named roll in position with the flattened portion adjacent to the supporting-roll.

4. A measuring-machine comprising a measuring-roll, a lock for the roll, and a rotatable controlling member having a projection for contact with the lock.

5. A measuring-machine comprising a measuring-roll and a lock for the roll comprising a movable latch and an independent movable auxiliary latch pivoted thereto.

6. A measuring-machine comprising a measuring-roll, a lock for the roll, a rotatable controlling member for operating upon the lock, means for turning the controlling member in one direction, and a spring resisting the turning movement.

7. A measuring-machine comprising a measuring-roll, a lock for the roll, and a rotatable controlling member having a projection for contact with the lock and a projection variable in position upon the controlling member, for controlling the operation of the controlling member.

8. A measuring-machine comprising a measuring-roll, a lock for the roll, a rotatable controlling member, means on the controlling member for releasing the lock and means for moving the controlling member when released from the lock.

9. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, and means for rotating the controlling-disk.

10. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, and gearing for rotating the controlling-disk.

11. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, gearing for rotating the controlling-disk in one direction, and means for rotating the controlling-disk in the opposite direction.

12. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, gearing for rotating the controlling-disk in one direction, and a spring for rotating the controlling-disk in the opposite direction.

13. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, gearing for rotating the controlling-disk, and means for moving the gearing into and out of coaction, whereby to release the controlling-disk.

14. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a controlling-disk for releasing the latch, gearing for rotating the controlling-disk, and means operable by the locking-disk for moving the gearing into and out of coaction, whereby to release the controlling-disk.
